Discussion and Conclusion

Super oxidized solution (SOS) will substitutes available antiseptics in the future for topical dressing in infected wounds.

The cytotoxic effect on human fibroblasts leads to limitation in using available antiseptics, in this study we don’t use povidone- iodine (PI) due to their effect on human fibroblasts even in diluted solutions of (PI)at concentration 0.01% and 0.025% leads to regression of fibroblast growth and totally inhibited by concentration of 0.1% and 1% of povidone- iodine\(^\text{16}\).

In the study done by Luca Dallapoala, 2006\(^\text{17}\), on patients suffering from infected diabetic wounds to evaluate the effect of Dermacyn (SOS) as compared with 10% povidone- iodine(PI). In group A (SOS) with mean age 69.4+ 8.45 years, duration of diabetes melitis 18.2+10.3 years, male/female 69/41 while group B(PI) with mean age 69.8+ 7.53 years, duration of diabetes melitis 16.7+10 years, male/female 76/32.

Outcomes measures, including healing time for group A which was 43 days and 55 days for group B with significant time of healing of DFU. These results just similar to our study which showed healing time of 40.74+ 3.84 days for group A(Dermacyn) days and 51+3.41 days for group B (N/S).

As well, in to Luca Dalla poala et al study the major amputation about 4.5 %in(SOS) groups and 9.3% in group B (PI) while in our study there was no major amputation in group A(SOS), but it was 4.5% in group B(N/S).

In the study of Kanthy 2018 randomized controlled study to compare the effect of topical (SOS) dressing on infected diabetic foot ulcers (group A) group B (topical povidone- iodine dressing), in this study the commonest isolated microorganisms in group A were E.coli and pseudomonaus. E.coli and pseudomonas (26.7%) for each while staph aureus in group B, in our study, the commonest isolated organisms were E. coli (36.4%) in group A(Dermacyn) and staph aureus (30.3%) in group B(N/S)\(^\text{18}\).

In comparison with study of Marzoq et al, a cohort study to assess outcome of diabetic foot ulcers in Basra/ Iraq. 60% of the cases were healed, 8% were unhealed, 25% ended with minor amputation and 5% ended with major amputation. In our study in group A(Dermacyn) 81.8% of cases were healed, 9.1 % were unhealed, minor amputation (9.1%) with no major amputation\(^\text{19}\).
Dermacyn solution was effective as topical dressing in infected diabetic foot ulcers (DFUs), by decreasing duration of healing of DFUs and improving the outcome.

Determinants of Exclusive Breastfeeding Duration on Infants in Girimaya Community Health Center Pangkalpinang City

Ade Devriany1, Novidiyanto1, Bohari2

1Nutrition, Health Polytechnic of the Ministry of Health Pangkalpinang, Pangkalpinang City, Bangka Belitung Province of Indonesia, 2Nutrition, Faculty of Public Health, Tadulako University, Palu City, Central Sulawesi Province, Indonesia

Abstract

The practice of early initiation of breastfeeding and exclusive breastfeeding was low in Indonesia. The aim of the study was to analyze sociodemographic factors and post-natal factors of mothers for the duration of exclusive breastfeeding. This type of research was observational with a prospective cohort design. The population was all mothers giving birth in the range from March to April 2017 and recorded in the cohort report at the Girimaya Health Center as many as 37 people. Data analysis used the Logrank Test. The results of the study were the characteristics of respondents, generally aged 20-35 years (75.7%), higher education (59.5%), not working (67.6%), parity ≤ 2 (64.9%), not implementing early initiation of breastfeeding to her baby (67.6%). Macro nutrient intake in mothers, including lack of energy (70.3%), carbohydrates (51.4%), protein (70.3%) and fat (70.3%). Micronutrient intake was lacking, namely calcium (100%), phosphorus (70.3%), iron (100%), vitamin B (73.0%), vitamin C (70.3%). The duration of breastfeeding for infants was up to 2 months of 62.2% and babies not given exclusive breastfeeding of 86.5%. Independent variables that did not have an influence on the duration of exclusive breastfeeding were maternal age (p = 0.281), education (p = 0.985), exclusive breastfeeding (p = 0.688), parity (p = 0.628), early initiation of breastfeeding (p = 0.087), macro and micro nutrient intake (p > 0.05). The duration of exclusive breastfeeding for infants had not reached 6 months and only lasts for 2 months and no independent variables had been found that influenced the duration of exclusive breastfeeding.

Keywords: Exclusive breastfeeding, Early Initiation of Breastfeeding, Macro and micro nutrient intake.

Introduction

Exclusive breastfeeding in the world is still relatively low. Infants under the age of 6 months exclusively breastfed worldwide are still less than 40%1. The percentage of exclusive breastfeeding in the world is still lacking and the SDGs (Sustainable Development Goals) is targeting an increase in the percentage of infants younger than 6 months who are exclusively breastfed by 50%2. Based on the Indonesian Health Profile (2015), the coverage of exclusive breastfeeding in Indonesia was only 55.7%3. This figure has decreased based on the results of Nutrition Status Monitoring (PSG) in Indonesia in 2016 which stated that exclusive breastfeeding coverage only reached 29.5%4. The target set in the Ministry of Health’s Strategic Plan (2015-2019) was 50% for exclusive breastfeeding in Indonesia.

Socio-demographic factors have an influence on exclusive breastfeeding. Maternal working status has a strong influence on the failure of exclusive breastfeeding5. Working mothers have a greater risk of not giving exclusive breastfeeding than mothers who do not work6. The level of income and knowledge of mothers about breastfeeding can influence exclusive breastfeeding7,8. Post-natal factors experienced by mothers can also influence the failure of exclusive breastfeeding5. One of the causes of the production of breast milk is not optimal because of poor nutritional intake of mothers, an unbalanced diet and also consuming less food so the...
production of breast milk is not sufficient for babies. Nutrient intake plays an important role in terms of supporting maximum breast milk production because breast milk production is influenced by the prolactin hormone associated with maternal nutrition.\textsuperscript{10}

The research problem is that the percentage was still low and the target of exclusive breastfeeding in Bangka Belitung was not yet achieved so this research is important and aimed to analyze the main factors that influence exclusive breastfeeding.

**Method**

This study was an observational study with a prospective cohort design. The location of this study was in the working area of Girimaya Health Center in Pangkalpinang City. Data collection was carried out in April-October 2017. The population in this study were all mothers who gave birth in the range from March to April 2017 and were recorded in a cohort report at the Girimaya Health Center in Pangkalpinang City of to 37 people. The sampling technique in this study used total sampling. The research variables were age, education level, working status, parity and maternal early initiation of breastfeeding behavior, macro nutrition and micro nutrition intake, duration of exclusive breastfeeding. Data analysis used the Logrank Test with a significance level of p < 0.05.

**Results**

</table>
Table 5 shows that the majority of nutrient intake had no relationship with the duration of breastfeeding with a value of $p > 0.05$, except carbohydrate intake which had a significant relationship with the value of $p = 0.007$.

**Discussion**

The results showed that more babies who failed to be given exclusive breastfeeding were 86.5% (32 people) while babies who were successfully given exclusive breastfeeding were 13.5% (5 people). Failure to give exclusive breastfeeding was mostly caused by the mother feeling her baby is hungry and not enough if only given exclusive breastfeeding. The probability of successful exclusive breastfeeding for up to 6 months was 15%.

Failure of exclusive breastfeeding occurs in many people who still have myths and beliefs as well as misconceptions about newborn food\textsuperscript{11}. Many myths and beliefs such as “If you want your child to say sweet, then given honey at birth” or also “If you want your child to say firmly, then knife-shaving water should be given.” In addition, the wrong understanding that considers the baby to cry at birth because of hunger so that the baby is immediately given food such as porridge, fruit, and drinks such as tea and even coffee\textsuperscript{12,13}. In addition, the lack of knowledge about exclusive breastfeeding can have an impact on the failure of exclusive breastfeeding. Based on interviews with several respondents, many of the respondents knew about breastfeeding but not exclusive breastfeeding. Respondents felt successful in giving exclusive breastfeeding even though they had previously tried formula milk. Respondents feel proud to give breast milk although not exclusively.

The average education of respondents was high school/vocational school, education is one of the factors that influence knowledge, education that has been taken by someone will affect their knowledge about nutrition. Good nutritional knowledge will cause someone to be able to compile a good menu for consumption\textsuperscript{14}.

A person’s sufficient nutritional knowledge will increasingly take into account the type and amount of food he gets for consumption\textsuperscript{15}.

Interviews with several respondents indicated that the respondent’s husband did not allow his wife to work even though the respondent was able and willing to work. The results showed that there was no relationship between maternal working status and duration of exclusive breastfeeding. Mostly, failure to give exclusive breastfeeding not from working mothers but from mothers who did not work\textsuperscript{16}. Work is not a reason for not giving exclusive breastfeeding. Many ways can be performed so that mothers can continue to give milk to their children, one of which is by milking it and storing it in the refrigerator. Mother’s work was expected to have a major influence on breastfeeding behavior by mothers because mother’s work will affect the time that a mother can set aside to take care of her child\textsuperscript{17}.

Then, mothers with children $\leq 2$ should be able to focus more attention on their babies so that they give more exclusive breastfeeding. On the contrary, the percentage of failure to give exclusive breastfeeding to mothers with a number of children $\leq 2$ was higher. This can be caused by a lack of information that is known by mothers and mothers feel able to provide formula milk\textsuperscript{18,19}. The time of early initiation of breastfeeding significantly influenced the continuity of exclusive breastfeeding for infants 0-6 months\textsuperscript{20}. The hazard ratio between the time of initiation more than the first hour after birth and the time of initiation in the first hour was 1.661. This showed that the time of initiation of breastfeeding more than one hour after birth had a risk of 1.661 times greater than the time of initiation of breastfeeding in the first hour to start giving food other
than breast milk. Early initiation of breastfeeding can create a bond of love between mother and baby so as to increase the duration of exclusive breastfeeding.

**Conclusion**

The probability of duration of exclusive breastfeeding for infants up to 6 months was only 15%. Variables that did not significant relationship duration of exclusive breastfeeding were age, education, working status, parity, early initiation of breastfeeding, macro and micronutrient intake

Ethical Issues in Relation to Evidenced-Based-Medicine and Hippocratic Oath

B.L. Meel

Research Associate, Faculty of Health Sciences, Nelson Mandela University, Port Elizabeth, South Africa

Abstract

During the past few years, there has been a burgeoning interest in evidence based medicine. Doctors practising evidence-based medicine will identify and apply the most efficacious interventions to maximize the quality and quantity of life for the individual patient, and this should raise rather than lower the cost of their care.

The unlimited needs of human beings would not have been a problem if we had all the necessary and sufficient resources. The fact is, however, that our resources are limited. The Hippocratic Oath teaches us to care for individual patients and to enhance their welfare, irrespective of resource constraints. By focusing on the needs of the individual patient, advocates of evidence-based medicine refuse to acknowledge the benefits in terms of future treatment of other patients. The present writer will discuss, with various examples, the need to redefine the centuries-old ethical issues based on the lines of the Hippocratic Oath in relation to the care of today’s patient.

Keywords: Ethics, Evidenced-based medicine, and Hippocratic Oath.

Introduction

In recent times close scrutiny of the ethical behaviour of doctors has produced some negative consequences. During the millennia in which medicine has been practiced, much has been written about ethics. Nowadays, there is no shortage of codes, declarations and of ethics committees to tell us what to do. These developments raise questions of the status of the general principles of ethics and of the significance of particular assertions in that field. There is also the important question of whether or not there has been, or is, any connection at all between utterances about medical ethics and the behaviour of the members of our profession. The present writer believes that the ethical problems confronting doctors are becoming more complex, and that they need to be addressed before they cause irreversible damage.

Determining the allocation of limited critical care resources is an inevitable development. Criteria proposed to assign such limited resources among patients are not defined. It has been argued that the allocation of critical care resources could be based on the principals of patient entitlement to health care, responsibilities of the physician to the critically ill patient, and beneficence. However, based on analysis of the philosophical tenants of the Hippocratic Oath, there is little to support the concept of “sin” taxes or patient triage on the basis of judgment on the moral merit of the patient.

Euthanasia: The legalization of euthanasia created certain tension when it was compared with those traditional medical principles that seemed to embody respect for the sanctity of life. It also created a real need for us to explore what is meant by “harm in relation to dying patients”. When we consider that we must train physicians so that they not only understand ethical issues, but also show the virtues in their clinical practice, it becomes imperative for us to strive to train them in virtue rather than in mere knowledge. We can only do this by conveying a real sense of sincerity to the needs of the patient and an ability to relate to patients as people, and not as problems. Such attitudes take shape in a training programme in which practical situations
are explored and discussed and the limits of scientific medical responses to those challenges are exposed.4

**Costs Vs Ethics:** Unfortunately, this kind of practice is hardly seen in clinical practice, and in the present writer’s, the human race is moving in the wrong direction and therefore is regressing.

The recent approach of family practitioners in their training programme could be appreciated, especially the issue of teaching human development and behaviour. It seems that the rhetoric of the market has been submerged in legislation and managerial rules which tend to increase the power of central administrators instead of delegating control to local providers and purchasers. Would a new Hippocratic Oath require the delivery by professionals of knowledge-based medicine be as efficient, but have lower transaction costs than the creation of an internal market? Who should regulate the health care market, and how?

How best can reform be sequenced? Is reform in funding an essential ingredient in the reform process?3 A few years ago, when ethical problems in Germany were discussed in public, the Hippocratic Oath was quoted as the valid norm for medical ethics. Although no physician swears this oath in Germany, it is necessary to know its contents, its origin and its role in the history of medicine. And it is also necessary to raise some questions: What are the ethical claims of the Hippocratic Oath? Does it really originate from Hippocrates? Do specific medical ethics exist over time? Do specific medical ethics exist in general? And if it exists, can it be normative ethics? A short survey of the multiple dependence of the medical situations shows that ethics in medicine must undertake a new beginning. It cannot be normative ethics; it cannot be situation ethics; it must be differential ethics. It has to respect rules and declarations, but it also has to compare the benefits and risks. In the centre of such ethics stands the responsibility of the physician. To assume this responsibility, the physician needs knowledge, the ability to make decisions, as well as a conscience.4

The modern clinical trial is a form of human experimentation. There is a long history of disregard for individual rights of patients in this context. Steps must be taken to protect the interests of the patient when such outside influences exist. Physicians must respect the individual patient’s rights and hold such interest paramount. These principles are the basis for informed consent 5 The changing nature of health care delivery in the South Africa should look after the interest of the population’s health, bearing in mind individual rights. Physicians are taught in the Hippocratic tradition to care for individual patients and enhance their welfare, irrespective of resource constraints. If physicians enjoy clinical freedom, meaning the freedom to practise inefficiently, then “clinical freedom is dead, and no one regrets its passing.” 6 Inefficient practice deprives other patients of care from which they could benefit. In the world of economic recession, resources are limited due to limited allocation of budget in the health sector. There is a need to optimise resource allocation.

**Evidenced–Based-Medicine Vs Ethics:** By focusing on the need of the individual patient, advocates of evidence- based medicine refuse to acknowledge that this opportunity is lost - i.e. benefits in terms of the future treatment of other patients. Such an approach is perceived as unethical by those who are concerned with achieving maximum health benefits for the general population from a limited budget. As Maynard contends, “to ignore costs is to ignore the risk to others of premature mortality and avoidable suffering.”8 Doctors practising evidence-based medicine will identify and apply the most efficacious interventions to maximise the quality and quantity of life for individual patients. This may raise rather than lower the cost of their care.7 If the patient has cancer of the neck and face, he may prefer to die rather than receive “commando surgery” which would give him only a few months of poor quality life, justifying voluntary euthanasia.

The Hippocratic Oath preaches to physicians to do everything possible for the individual patient. This is alright ethically if you have unlimited financial resources. In this world a patient can be treated using one of two therapies, A and B. A proponent of evidence-based medicine contends that the choice of therapy should be determined by the relative efficacy of the competing interventions as determined by the systemic review of the current knowledge base.8 Thus, if therapy A produces 5 years of good life or healthy years of life, and therapy B produces 10 years, a physician who favours evidence-medicine would choose therapy B. Physicians who disregard costs in making decisions for their patient’s therapy may use the community’s scarce health-care resources inefficiently. For example, if therapy A costs R1500 and therapy B costs R7000, then therapy A produces a unit of outcome better, a healthy year of life for R300, whereas therapy B produces a healthy year for R700. So therapy B, relative to therapy A, produces 5 healthy years of life for R5500. In terms of value for money, therapy A is a more cost-
effective treatment: it produces a healthy year for only R300. Given a fixed budget of R70 000, therapy A will produce over 130 healthy years more than therapy B.

A proponent of evidence-based medicine, who advocates efficacy as the factor that determines the physician choice, would select therapy B if he practised what he preached. The public health physician concerned with achieving the maximum number of healthy years of life from a given budget (in South Africa 260 billion rands in one financial year) would opt for therapy A. Thus, the physician who supports an evidence-based approach would argue that scarce resources be allocated on the basis of interests of the individual patient and efficacy. By contrast, the public-health physician would contend that scarce health-care resources be allocated according to the interests of the society as a whole, and on the basis of efficiency. Here, we must have to review the Hippocratic traditional Oath, placing individual patient ethics against population-health link ethics.

Acquired Immunodeficiency Syndrome (AIDS) caused by the human immunodeficiency virus (HIV) may turn out to be the largest lethal epidemic infection ever. The estimated global number of HIV-infected adults in 1993 was 13 million, with projections of up to 40 million by the year 2000. Now the ethical considerations arise. Are surgeons obliged to operate on HIV-positive or AIDS patients? Some surgeons adhere strictly to the Hippocratic Oath, whereas others reserve the right to be selective on whom they operate, except in emergencies. 9 Is it worth to operate on a haemodialysed advanced case of AIDS? Is it important to adhere to the Hippocratic Oath to save each and every life in such hopeless cases? There appears to be no problem if we have unlimited resources, but when the budget is limited then we are wasting money on hopeless patients at the cost of the population at large.

The Hippocratic physician did not treat hopeless cases, and that such an approach was not only consonant with paradigms of ancient medicine, but with contemporary medicine as well. 10 The contemporary attitude towards the treatment of hopeless cases and the concept of “supportive treatment” and “palliative therapy” are probably based on cost saving for the benefit of the population at large. Furthermore, a review of 20th century practice and a content analysis of the Oath administered in medical school in US and Canada observed that the Oath was changing with time.

Conclusion

The Hippocratic Oath is poorly and differently practiced in the medical profession. It has also different meanings for different physicians in different parts of the world. Whatever its significance, if justice is sought for the individual patient to preserve his/her life, this will cost enormous amounts should you practice evidence-based medicine in the Hippocratic way. These limited resources could be efficiently utilised to save many more lives. Therefore, it is the present writer’s position that the Hippocratic Oath must be revised, keeping in the mind that we have to serve more people with limited resources.

Abstract

Periapical radiographs are intraoral radiographs that can provide clearer and more detailed information about the teeth and surrounding tissue. Based on the recommendations of the International Atomic Energy Agency (IAEA) and the Nuclear Energy Supervisory Agency (BAPATEN), the dose level for intraoral dental examination is 7 mGy. X-ray radiation produced by periapical radiographs can cause cell damage in the body, which one of the cells that is damaged is hematopoietic cells in the bone marrow.

Purpose: The purpose of this study was to prove a decrease in thrombocytes (platelets), leukocytes, hemoglobin count and the value of Mean Corpuscular Volume (MCV) in mice (Mus musculus) due to X-ray radiation periapical radiographs.

Method: This study was a true experimental design with a post test only with control group design that was given 1, 7, and 10 times the exposure of periapical radiographs of X-ray radiation in the treatment group then compared to the untreated control group. The measurement of the dose absorbed by the mouse in this study was carried out using dosimeters, and after 24 hours the treatment was given, it is then calculated the number of mouse leukocytes by using a hematology analyzer.

Results: The results showed a decrease in blood in the first exposure group, which are platelets 713 x10³ cells / μL, leukocytes 7.61 x10³ / μL, hemoglobin 13.71 g / dL, and MCV 52.967 fl. The decrease in the 7-exposure group was platelets 699.5 x10³ cells / μL, leukocytes 6.03 x10³ / μL, hemoglobin 12.81 g / dL, and MCV 52.167 fl. The decrease in the 10-exposure group was platelets 688,833 x10³ cells / μL, leukocytes 5.20 x10³ / μL, hemoglobin 12.06 g / dL, and MCV 51,483 fl. Thus, it can be concluded that the decrease in number that occurs in mouse is still within the normal limits.

Keywords: Periapical radiographs, platelets, leukocytes, hemoglobin, MCV.

Introduction

Periapical radiographs produce X-ray radiation which can cause ionization in body cells. Ionization can cause cell damage in the body, one of the cells that is damaged is hematopoietic cells in the bone marrow.¹,² Radiation doses of 1-10 Gy result in severe hematopoietic cell damage and hematopoietic cells that have a difficult damage to repair. X-ray radiation less than 1 Gy can also result in hematopoietic cell damage, but hematopoietic cells that experience the damage can be repaired.³,⁴,⁵,⁶ Decreased platelets and leukocytes due to X-ray radiation occur on the first and second day after radiation.³,⁵,¹¹ Dentists who carry out invasive actions in thrombocytopenia patients can increase the risk of prolonged bleeding. As well as post surgery, a good immune system is expected from the patient to help the wound healing process. The results of this study are aimed at making dentists more careful in carrying out invasive actions to patients after one and two days of periapical radiograph radiographs, and reducing the risk of developing oral disorders such as SAR.⁵,¹²,¹³
Patients who receive a larger dose of X-ray radiation will experience a greater effect on the body, therefore the International Atomic Energy Agency (IAEA) and the Nuclear Energy Supervisory Agency (BAPETEN) make limits on doses that can be absorbed by patients for intraoral radiographic examination is 7 mGy. In fact, many patients repeat repetition of periapical radiographs. Repeated shooting can result in larger patients receiving radiation doses, even patients can receive doses above 7 mGy.\textsuperscript{4,14,15,16}

Based on the description of the background above, the researcher wanted to examine the effect of periapical radiographs of X-ray radiation on the decrease in platelet counts, leukocytes, hemoglobin, and MCV in mice.

**Materials and Method**

This study uses a true experimental research design by using post-test only with control group design. The samples in this study were 24 male mice with the age of 3-4 months and 25-30 grams of body weight. The material used in this study is a 5 ml Diethyl ether and anti-coagulant in the form of 10% EDTA. The tool used during this study was the dental radiographic unit brand ASAHI with a power supply of 60 kv electric current of 10 mA, dosimeter, wire cage to put mice when radiographed, micro tube which already contained 10% EDTA as much as 0.01 ml, mice maintenance cages, eating places and mice drink bottles, hematology analyzers and stopwatch.

In the first stage of the study, mice were adapted for 7 days by being fed BR2 Comfeed and standard distilled water. The adaptation that was carried out, then followed by grouping mice randomly into 4 groups, namely the control group, group 1 X-ray radiation exposure, group 7 exposure to X-ray radiation, and group 10 times the exposure to X-ray radiation.

The dose produced at one time X-ray radiation is 0.95 mGy. The exposures were carried out 1.7 and 10 repetitions with a distance of 1 minute interval in each repetition. Mice that have been carried out X-ray radiation at the Gusti Hasan Aman Hospital RSGM Banjarmasin will be taken to the Banjarbaru Veterinary Center for blood sampling.

24 hours after X-ray radiation, it is anesthetized then, taken blood in the heart of mice using 1 ml syringe. The blood sample that has been obtained will be placed in the microtube in which there is 10% EDTA as much as 0.01 ml. The blood samples that have been obtained will be carried out a complete blood test using the hematology analyzer, and the results of the data obtained will get parametric tests using One Way Anova.

**Results**

When doing X-ray radiation in mice, the researcher also calculated the doses amount of X-ray radiation absorbed by mice using dosimeters. The number of radiation doses received by mice at 1 time X-ray radiation exposure is 0.95 mGy, the dose received by mice at 7 times exposure to X-ray radiation is 6.64 mGy, and the dose received by mice at 10 times exposure to X-ray radiation is 9.54 mGy. Twenty-four hours after X-ray radiation periapical radiographs in mice, blood was taken to measure platelet counts, leukocytes, hemoglobin and MCV of mice.

![Fig 1. Platelet counts in mice in each treatment](image1)

![Fig 2. Leukocyte counts in mice in each treatment](image2)
Fig 3. Hemoglobin amount in mice in each treatment

Fig 4. MCV Amount in mice

Information:
A : Control
B : 1 time exposure
C : 7 repetitions of exposure
D : 10 repetitions of exposure

In Figures show that there is a decrease in platelet count, hemoglobin and MCV leukocytes after mice receive X-ray radiation. The greater the frequency of exposure to periapical radiographs of X-ray radiation, the greater the decrease in platelets, leukocytes, hemoglobin and MCV in mice. This shows that the more the frequency of repetition of periapical radiographs, the greater the effect caused to the body.

The results of the data on the average platelet count, then a normality test was performed using Saphiro-Wilk. The results of the normality test show that the data is normally distributed. This is because in each treatment p > 0.05 with a significance value in the control group is 0.365, in the group 1 time exposure is 0.571, in the group 7 times exposure is 0.361 and in the group 10 times exposure is 0.51. The results of the study were continued with homogeneity tests with Leven's test. In the homogeneity test shows that the data is distributed homogeneously with a significance value of p = 0.124.

The results of the data on the average number of leukocytes, then a normality test was performed using Saphiro-Wilk. The results of the normality test show that the data is normally distributed. This is because in each treatment p > 0.05 with a significance value in the control group is 0.456, in the group 1 time exposure is 0.632, in the group 7 times exposure is 0.415 and in the group 10 times exposure is 0.349. The results of the study with a significance value of p = 0.909

The results of the data on the average amount of hemoglobin then a normality test was performed using Saphiro-Wilk. The results of the normality test show that the data is normally distributed. This is because in each treatment p > 0.05 with a significance value in the control group is 0.866, in the group 1 time exposure is 0.326, in the group 7 times exposure is 0.848 and in the group 10 times exposure is 0.955. The results of the study were continued with homogeneity tests with Leven’s test. The homogeneity test shows with a significance value of p = 0.265

The results of the data on the average number of MCVs, then normality tests were performed using Saphiro-Wilk. The results of the normality test show that the data is normally distributed. This is because in each treatment p > 0.05 with a significance value in the control group is 0.588, in the group 1 time exposure is 0.799, in the group 7 times exposure is 0.752 and in the group 10 times exposure is 0.664. The results of the study were continued with homogeneity tests with Leven’s test. The homogeneity test shows that the data is distributed homogeneously with a significance value of p = 0.866

The results of the data on the average platelet count, leukocytes, hemoglobin and MCV leukocytes after mice receive X-ray radiation. The greater the frequency of exposure to periapical radiographs of X-ray radiation, the greater the decrease in platelets, leukocytes, hemoglobin and MCV in mice. This shows that the more the frequency of repetition of periapical radiographs, the greater the effect caused to the body.

Data that has been normally distributed and homogeneous will be continued with the One Way ANOVA parametric test with a confidence level of 95% (α = 0.05) to determine whether there is a difference in the spread of data. The One Way ANOVA test results obtained p = 0.000, which means that there are significant differences between the treatment groups. Furthermore, the data analysis was continued by a follow-up test, the Bonferroni Post Hoc test.
Providing the results of Post Hoc Bonferroni, it can be seen that in the control group there were significant differences with the group 7 times exposure to X-ray radiation, and the group 10 times exposure to X-ray radiation. One group of X-ray radiation exposures showed significant differences with the group 10 times exposure to X-ray radiation.

**Discussion**

The decrease in platelet counts, leukocytes, hemoglobin and MCV in this study occurred because of the damage to Hematopoietic stem cells (HSC) in the bone marrow. Periapical radiographs of X-ray radiation produce ionization energy.5,17,18

X-ray radiation that causes HSC DNA damage in SSbs is easy to repair, so the HSC will return to normal. SSCs undergoing HSB damage will go through several stages of the repair process including detection of damaged DNA strands, cutting of damaged DNA strands, damaged DNA strand synthesis, and the process of connecting new DNA strands. The SSbs protein repair process requires UvrABC protein.19

X-ray radiation that damages HSC DNA by DSBs will be detected by the RAD50 protein. The RAD 50 protein that has detected damage will activate the Ataxia Telangiectasia Mutated (ATM). The ATM serves to activate Checkpoint kinase 2 (CHK2), CHK2 will work by stopping cell mitosis and carrying out checks on damaged cells. ATM also activates P53, then the activated P53 will activate the upregulated modulator of apoptosis (PUMA) p53 to begin the apoptosis process. PUMA works in two ways, namely by activating proapoptosis proteins such as Bax and Bak, and blocking the work of antiapoptotic proteins such as BCL-2 and BCL-x. Proapoptotic proteins that have been active will cause disruption of the integrity of mitochondrial cells, so that cytochrome-c which initially binds to mitochondria will be released and bind to Apaf-1. The bond between cytochrome-c and Apaf-1 will cause caspase 9 activation and end in Activation of caspase 3 will cause endonuclease proteins to fragment DNA, besides that caspase 3 also causes proteases to degrade cell nuclei and cell cytoskeleton. The nucleus and cytoskeleton of cells that have been damaged will cause cells to experience apoptosis which will eventually form apoptotic bodies.14,17,21 Apoptosis that occurs in HSC results in disruption of blood cell production in the body which results in decreased platelet counts, leukocytes, hemoglobin and MCV in the body’s circulation.22,23,24,25

The results of this study indicate that there is a decrease in platelet count, leukocytes, hemoglobin and MCV values that are not significant in the group 1 time radiation exposure with the dose produced at 1 time exposure is 0.95 mGy, the dose of 0.95 mGy is still far below the dose limit set by BAPETEN. There was a decrease in platelet count, leukocytes, hemoglobin and a significant MCV value in the group given 7 times exposure to X-ray radiation with the dose produced at 7 times exposure was 6.64 mGy. The decreased platelet count, leukocytes, hemoglobin and significant MCV values were also seen in the group 10 times exposure to X-ray radiation with the dose produced at 10 exposures was 9.54 mGy, the dose had exceeded the radiation dose limit set by BAPETEN. The decrease in platelet value, leukocytes, hemoglobin and MCV values in this study were compared with the control group.4,14,15

That increasing the dose of X-ray radiation periapical radiography can cause a decrease in the number of leukocytes that are increasingly significant. Showed a significant reduction in leukocyte counts in rats receiving larger radiation doses, namely the number of rat leukocytes in the control group at 9.99×103/μL, the number of leukocytes in the group with the dose of 0.1 Gy was 9.41×103/μL and the number of leukocytes in the group with a dose of 0.5 Gy was 6.47 × 103 / μL. This is because mice have a normal leukocyte count of 2-10×103/μL. Statistically the administration of 7 and 10 repetitions of exposure with doses absorbed close to and above 7 mGy showed a significant reduction in leukocyte count. This study remains to be minimized because the decrease in hemoglobin and MCV is the trigger factor for recurrent aphthouse stomatitis (RAS) which is one of the ulcers in the oral cavity that causes pain.24

In this study it can provide information to the public that the effects after x-ray periapical radiographs are not as dangerous as the effects caused by radiotherapy. Based on this study stated that 7 times the frequency of x-ray repetition periapical radiographs is the maximum frequency limit that can be done to patients, it would be better if the frequency of radiograph periapical radiograph repetition was given to patients less than 7 repetitions.15,16

Abstract

Purpose: Radiation doses for Computed Tomography (CT) procedures have been reported, including a total of 120 CT examinations conducted in radiology service of Hassan II hospital of Agadir.

Materials and Method: This study consisted of examining the data of a total of 120 patients at the rate of 30 per localization. All CT examinations were performed with a GENERAL Electric 16 CT with Automatic Exposure Control System. The data that collected for each diagnostic exam chosen included scanner acquisition parameters, number of series, use of the contrast medium, and rotation time as well as slice thickness, the displayed CT dose index (CTDIvol) and the Dose Length Product (DLP). Effective dose and DRL were evaluated using the International Commission on Radiological Protection (ICRP) conversion factor and approach.

Results: The average effective dose (Eeff), the displayed CT dose index (CTDIvol), dose length product (DLP) were 7.28±2.35 mSv, 10.80±3.80 mGy and 428.35±138.26 mGy.cm respectively at chest CT. For abdomen-pelvis CT, there were 12.48±5.58 mSv, 9.30±2.99 mGy and 805.43±359.98 mGy.cm respectively. Those at chest abdomen-pelvic CT were 11.72±2.98 mSv, 10.82±2.53 mGy and 755.97±251.52 mGy.cm respectively. For lumbar CT, there were 12.12±2.32 mSv, 26.46±5.24 mGy and 787.00±14937 mGy.cm respectively.

Conclusion: Our values are lightly higher than the standards of some European countries. This first ever survey of CT practice in Hassan II Hospital of Agadir confirmed the need to improved training of health professionals involved in computed tomography on factors affecting image quality and dose and protocols optimization.

Keywords: CT examinations, Radiation Risks, effective Dose, DRLs.

Introduction

Computed tomography (CT-scan) is recognized as the most significant medical source of human exposure due to ionizing radiations in diagnostic radiology. In its 2008 annual report, the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) estimated that, on a global scale, CT-scans represented only 5% of medical imaging procedures but contributed 34% to the annual collective dose. Patients’ radiation protection must consequently be increased during CT-scan examinations.

With fast and constant technological improvements, CT-scan has become the most required examination in various clinical situations. Several indications, such as pretherapeutic workup of diverse malignant tumours...
and total body scan, request the exploration of different regions of the body, and thus the raise of patient-dose. North African countries as Morocco experienced the augmentation number of CT-scan machines in public and private health facilities. In 2018 more than 250 CT machines are available in Morocco compared to 125 in 2007.

To decrease patients’ exposition to x-rays, the principles of justification and optimization are the basis. Regular use of clinical imaging reference guidelines is the key for justification. The principle of optimization is the liability of manufacturers, the radiologists and radiographers who must try to use the lowest doses for appropriate image quality (ALARA). The diminution of patient-dose needs then the accurate application of optimization principle which requires to have “diagnostic reference levels” (DRLs) as an optimization tool. They are a simple standard for identifying situations where the patient’s dose levels are strangely high. Every user of ionizing radiation should refer to these DRLs to assess his practice. During CT examinations, the CT dose index (CTDI), the Dose Length Product (DLP) and the effective dose are the most ordinary used dosimetric parameters for DRLs. Statistical analysis was performed using Microsoft Office Excel 2007. Quantitative variables are expressed as arithmetic mean (denoted further as mean), third quartile (75th percentile). The CT data were analyzed using descriptive statistics. For multi-phase studies, average CTDI\textsubscript{vol}(mGy) per sequence and total DLP per examination were calculated as representative values used for further analysis. Median DLP and CTDI\textsubscript{vol}(mGy) data were used to estimate the typical dose. The DRL for Hassan II Hospital of Agadir were set based on the rounded third quartile values of distributions of medians for the CTDI\textsubscript{vol}(mGy) and DLP(mGy.cm) values. The results were compared with international DRL data.

**Results**

Of the 120 CT-examinations collected, 25% were chest, 25% abdomino-pelvic, 25% chest-abdomen-pelvis and 25% lumbar spine. The mean age of patients was 48 ± 17 years [20 - 90 years] with 60% aged 45-year-old.

### Acquisition Parameters

For the four procedures, all protocols were helical with a voltage of 120 kV. The maximum mAs was recorded for Chest abdomino pelvic and lumbar spine CT-scans (350 mAs average) with highly variable acquisition parameters (Table N°1).

### Patient-Doses for Four Commonest CT-Exams

The greatest DLP was observed on lumbar spine CT-scans (mean 651 mGy.cm) but the most variability of patient-doses was found in the abdomen pelvic CT with differences up to 7 times (Table No. 2).

Discussion

We carried out this descriptive study in order to propose DRLs in radiology service of Hassan II hospital of Agadir for four commonest adults CT-scans examinations. The 75 th percentile of DLP for chest, abdominopelvic, chest abdomen pelvic and lumbar spine CT-scans were respectively 428 mGy\textcdot cm, 805 mGy\textcdot cm, 756 mGy\textcdot cm and 787 mGy\textcdot cm.

The DRLs from our study are globally higher than those in United Kingdom \textsuperscript{14}, apart from the chest abdominopelvic procedure. On the other hand, our DRLs are lower than those in Cameroon \textsuperscript{15} for chest CT-scan. Our patient-doses are then between DRLs of an industrialized country as United Kingdom with very modern facilities and advance culture of optimization and the DRLs of an African country like Cameroon. While waiting for a national campaign for establishing DRLs, those determined in this study can be used for optimization in Hassan II Hospital of Agadir. For patient radioprotection raisons, Radiologists should systematic include notification of DLP on radiological reports \textsuperscript{7}.

Higher DRLs are observed on lumbar spine CT-scans as in United Kingdom, France and Cameroon\textsuperscript{12-14}; this can be explained by the presence of numerous high attenuating bony structures in the spine requiring the application of high doses for adequate images quality.

In this first pilot study, we have assessed preliminary results which can already be used for optimization though waiting for national study for establishment of DRLs with the support of the competent authorities. Further studies are also requested to establish DRLs in pediatric CT and conventional radiography in Morocco.

Conclusion:

In radiology department of Hassan II Hospital of Agadir, DLP values of 428 mGy\textcdot cm, 805 mGy\textcdot cm, 756 mGy\textcdot cm and 787 mGy\textcdot cm respectively for chest, abdominopelvic, chest abdomen pelvic and lumbar spine CT-scans can be used as diagnostic reference levels in CT imaging in adults. These values are lightly higher than the standards of some European countries. This first ever survey of CT practice in Hassan II Hospital of Agadir confirmed the need to improved training of health professionals involved in computed tomography on factors affecting image quality and dose and protocols optimization.

Abstract

Objective The purposes of this study were to investigate the validity and reliability of new equipment innovation for increasing lung volume training and measuring chest expansion in healthy people.

Method This study considered 30 healthy participants (15 male, 15 female) who were aged between 18 to 70 years (47.23± 19.29 years). The chest expansion measurements were taken with cloth tape measurement at 3 levels of the rib cage (upper, middle and lower levels). The lung volume training was determined by intensive spirometer (vodylne). The new equipment innovation was investigated through chest expansion and lung volume.

Results The pearson’s correlation analysis was performed to establish the validity of cloth tape and new equipment innovation. The study findings suggested that the investigated measurement tools were significantly correlate with the upper, middle and lower chest level chest expansion and lung volume considering (r = 0.898, r = 0.925 and r = 0.896, p < 0.05, respectively). Moreover, validity of new equipment innovation and vodylne showed significantly good correlation in upper, middle and lower chest level (r = 0.668, r = 0.689 and r = 0.734, p < 0.05, respectively). Intra-class Correlation Coefficient (ICC) values for intra-rater reliability in upper, middle and lower chest part were 0.958, 0.979 and 0.976, respectively. Inter-rater reliability ICCs in upper, middle and lower chest part were 0.922, 0.959 and 0.944 that showed high reliability.

Conclusion A new equipment innovation for increasing lung volume training and measuring chest expansion was valid and reliable considering intra-item and inter-item correlation. However, it might for lung volume training and measuring chest expansion.

Keywords: Respiratory rehabilitation, Chest expansion, Reliability, Validity.

Introduction

The patients with median sternotomy and abdominal surgery¹, such as lung cancer surgery or receiving lobectomy, coronary artery bypass surgery (CABG)², thoracic scoliosis³, lung transplantation⁴, Abdominal surgery⁵, including abdominal aortic aneurysm (AAA) surgery was commonly received anesthesia during the surgery. After surgery, the patients usually decreased lung volume⁶ and need to pulmonary rehabilitation by physical therapy for preventing and treating the respiratory complications including lung deflation (atelectasis), infectious pulmonary disease (pneumonia), and mucus hypersecretion⁷⁸⁹. The tape was often examined for measuring chest expansion. The measurement had taken at upper, middle and lower lobes

for evaluating the expansion\textsuperscript{10}. Chest expansion (CE) was used for measuring rib cage mobility and found to be related to lung volume\textsuperscript{11}. The intensive spirometer (IS) is commonly known as lung volume improvement devices included vodylne which is the equipment for improving the lung volume and used for follow-up of the interventions. There were several studies used the voldyne for 5 to 15 minutes per hour with 5-12 times repetitions. However, those studies showed that lung volume had increased significantly\textsuperscript{12,112}. Though it was expensive therefore, the researcher was interested about a new device which would be convenient to use. Furthermore, the researchers were aimed to invent innovative applied equipment which would be able to use in 2 forms with one device to measure the lung expansion and to provide treatment to increase the lung volume. However, it has not been studied before. Therefore, needs to find out the validity along with intra-rater and inter-rater reliability to develop a new measurement tool. In addition, it would be beneficial to plan for the future patients after the median sternotomy and abdominal surgery.

**Method**

**Participants:** For this preliminary study, 30 healthy subjects aged between 18 and 80 years old were recruited from physical therapy\textsuperscript{13} (15 women, 15 men). There are three age ranges including 18-29 years old, 30-59 years and 60 years or more. There were 10 people in each age range including 5 men, 5 women. Measurement had taken by 3 physiotherapists who had a high level of reliability in each measurement. The subjects were randomly allocated for performing the reliability and validity tests of artificial devices. Inclusion criteria considered as healthy person, able to understand the experiment, be able to follow the instruction correctly, no history of smoking or ex-smoker for at least last 5 years.

The exclusion criteria for selecting the subjects considered as those subjects who had congenital disease or a history of respiratory diseases such as pneumonia, and pleural effusion. In addition, subjects with chest bone and muscles abnormalities such as scoliosis, had neurological and mental state problems also excluded. A written informed consent was obtained from all the participants. The first person/assessor measured the validity of the artificial device which was compared with the standard method for measuring the lung expansion and using vodylne as the lung volume. The second and third person measured the reliability and training within the same evaluators and in between the evaluators (Intra rater and Inter-rater reliability). The evaluators measured the first day and re-evaluated in 2\textsuperscript{nd} weeks for studying intra-rater reliability measurement. Both evaluators did the measurement at the same day and time. The assessors maintained the sequences of the subjects randomly before and after each assessment. However, each evaluator was in a separate room for testing the inter-rater reliability measurement.

**Chest expansion (CE) measurement:** The subjects were sitting on the chair with put the hands together on their head. The assessor used a measurement tape for measured the chest expansion. Three points (3) points considered for measuring the upper, middle and lower excursion thoracic including 2\textsuperscript{nd} inter-costal space, 4\textsuperscript{th} inter-costal space and the end of the xiphoid process respectively\textsuperscript{14}. The subjects took breathing and out for 2-3 times and end of exhale and then took deepest breath. The testers recorded the different values from the deepest inhalation and the maximum exhalation value in centimeters. The subjects were evaluating for 2 times and the highest values were selected to analyze data.

**Vodylne measurement:** The subjects were sitting on chair and practicing the deep breathing in and out for releasing the breath slowly for about 2-3 times. Then they opened the mouth piece completely and breathe slowly and hold for 3-5 seconds or as long as they can hold and continued until the mouth close. After that they breathed out and hold. The testers read the numerical value of the air volume on the device. The procedures were repeated and selected the maximum value for analysis.

The new equipment innovation for increasing lung volume training and measuring chest expansion measurement.

The new equipment innovation were measuring by tape was measured three levels including upper, middle, and lower chest. New device relies on the principle for using measurement of chest expansion measurements and training to increase lung volume. It can adjust the strap up and down to measure various levels and also can be extended according to the chest size in each person. After wearing, we can measure the chest size directly and also, if we want to practice, you can adjust the extension, increase the length of the chest as the therapist needs and fix the position without moving from the fix frame with two sound sensors, mid axillary line.
of both sides. It can train the patient to breathe until the sound loud. Moreover, it was used for follow up on the chest expansion.

Statistical Analysis: Values were expressed by mean and standard deviation. The validity was analyzed by Pearson correlation coefficient test. The reliability was analyzed by Intra-class Correlation Coefficient (ICC). The significance level was set at P 0.05 or less. All data were analyzed by using SSPS.

Results

Characteristic data: This study considered 30 healthy people. There were 15 males, 15 females. The average age and BMI were 47.23 ± 19.29 years, 23.22 ± 3.21 kg/m². The chest expansions were measured at the 2nd rib, 4th rib-and the xiphoid process. It was used by the cloth tape as the standard method of using it. However, new equipment innovations and measurement of the lungs volume had taken by using vodylne. The characteristics of data showed as the Table 1.

Validity of new equipment innovations: The validity of the data was measured by the Pearson coefficient statistics. The study findings suggested that the correlation for measuring the chest expansion by using the cloth tape measurement and new equipment innovations was positively correlated at all levels (P < 0.05) (Table 2). These results showed good to very good level of correlations as presented at the Table 2.

In addition, the correlation between new equipment innovations and vodylne for measuring the lung volume showed positively related with each other as presented at Table 3. The upper, middle and lower chest levels were 0.668, 0.689 and 0.734 (P < 0.05), respectively.

Inter-reliability of new equipment innovations: Inter-reliability for measuring the expansion of upper, middle and lower chest were measured by cloth tape and new equipment innovations. It had shown by the ICC of cloth tape measurement and new equipment innovations as presented at the Table 4. The inter-reliability of all chest levels showed very high (0.90 -1.00) level of reliability measured with both the measurement tape and with new equipment innovations.

Discussion

This study aims to find out the validity and both the intra-rater reliability and inter-rater reliability of new equipment innovations. The correlations of chest expansion at upper, middle and lower levels were measured by using the cloth tape and new equipment innovations. Pearson’s correlation analysis was performed to establish the validity. These findings suggested that, there had a good to very good level positive significant correlation. Moreover, the correlation of lung volume between new equipment innovations device innovation and vodylna had a positive statistical correlation including moderate to good levels. The inter-rater reliability of this study showed that the ICC values at upper, middle and lower chest levels were very high in both cloth tape and new equipment innovations. The previous study showed the cloth tape was intra-class correlation coefficients 0.81 to 0.91 in men which were highly reliable. The intra-rater ICC (1,2) with 95% confidence interval was used to assess the test-retest reliability. All ICC values for intra-rater reliability were from 0.95 to 0.96 at all chest levels, which was high reliable. These finding were similar according to the previous study of Nishigaki and et al (2013)\(^1\)\(^5\). That study developed an artificial device (BREATH) biofeedback named BREATH for measuring the chest expansion and displayed via an automatic computer monitor. It had a high correlation coefficient \((r = 0.76-0.87)\) and high intra- and inter-evaluator reliabilities \((ICCs = 0.82-0.94)\). It was similar according to the study of Liu and et al (2017)\(^1\)\(^7\) which showed that the cloth tape, a wearable strain sensor (WSS) which was used to measure the respiration movement, had a high validity and reliability \((ICCs = 0.94 to 0.98)\). Moreover, Debouche and et al (2016)\(^1\)\(^0\) studied the intra-rater and inter-rater reliability of chest expansion (CE) measurement tool and stated that it was good for upper and lower CE in healthy subjects. They evaluated the correlation between chest expansion (CE) measurement and lung functions including forced expiratory volume (FEV1), forced vital capacity (FVC), and vital capacity (VC). The study findings illustrated that the upper and lower CE measurements had significantly positive correlation with lung function and inspiratory muscle strength. These findings suggesting that CE measurements may be represent the indirect information on lung volume function and inspiratory muscle strength. In addition, the chest expansion had good reliability \((0.85 to 0.97)\) which can be used for monitoring disease progression and efficacy of intervention people with ankylosing spondylitis (AS)\(^1\)\(^8\).

The findings of this research of the new equipment innovations had a high the validity and reliability and can be used in further research for physical therapy treatment in order to measure the chest expansion and lung volume training in patients with respiratory disease such as patients who would have the thoracic surgery and abdomen surgery in order to therapeutic efficacy of new equipment innovations.

Conclusion

Chest expansion measurements using a cloth tape and new equipment innovations for training to increase lung volume at upper, middle and lower chest levels were well correlated along with good to high intra- and inter-rater reliability in the healthy subjects with different age range. Therefore, this new equipment innovation would use to evaluate the chest expansion and to provide the training of lung volume in clinical and study the research in the future.

An Analysis of the Correlation between Life Skills and Self-Efficacy with the Risk of Teenage Pregnancy

Deswinda¹,², Rizanda Machmud³, Yusrawati³, Ahmad Syafruddin Indrapriyatna⁴

¹Postgraduate Student of Public Health Faculty of Medicine Andalas University, Padang Indonesia, ²Institute of Health Science Payung Negeri Pekanbaru, Indonesia, ³,⁴Faculty of Medicine Andalas University, Padang Indonesia

Abstract

Background: Approximately 21 million women aged from 15 to 19 years old in developing countries are pregnant every year. At the same time, around 16 million of women aged between 15 to 19 years old give birth annually. The Age-specific Fertility Rate (ASFR) in Indonesia for 15-19 years old group is 36 per 1000 women. 13.1% of teenage girls aged from 15 to 19 give the first birth and 36.7% have already given birth before. The reasons behind this teenage pregnancy and marriage in Indonesia are the lack of life skills and low self-efficacy. Teenagers with lack of life skills are more likely to be influenced by their peers, in this case, to have sex before marriage. Teenage pregnancy often leads to a high rate of maternal and infant mortality, and high-risk infants.

Purpose: This research was aimed at analyzing the correlation between life skills and self-efficacy with the risk of teenage pregnancy.

Method: This study was a quantitative correlational research with cross-sectional study approach. It involved 126 third-grade students of a senior high school in Pekanbaru, Indonesia who were selected using stratified random sampling. Data were collected using life skills, self-efficacy, and pregnancy prevention questionnaires. Collected data were analyzed using Chi Square.

Results: The results showed that 71 students (56.3%) had poor life skills and 80 students (63.5%) had low self-efficacy. 66 students (52.45%) are at risk of pregnancy. Correlational analysis between life skills and the risk of teenage pregnancy showed ρ value: 0.002 < α: 0.05 and OR: 3.433. It meant that teenagers with poor life skills had three times greater risk of pregnancy compared to the ones with good life skills meanwhile correlational analysis between self-efficacy and the risk of teenage pregnancy resulted in p value: 0.000 < α: 0.05 and OR: 6.000. It showed teenagers with low self-efficacy had a six times greater risk of pregnancy compared to the ones with high self-efficacy.

Conclusions: There is a significant correlation between life skills, self-efficacy and the risk of teenage pregnancy. Future researchers are expected to conduct a further research project using quasi-experimental design by including intervention of more innovative health promotion with more interesting media considered to be more attractive to teenagers.

Keywords: Teenage pregnancy, life skills, self-efficacy.

Introduction

Every year approximately 21 million women aged from 15 to 19 (2 million of those aged are below 15) in developing areas across the globe are pregnant. At the same time, around 16 million of women aged between 15 to 19 (2.5 million of those aged are under 16) give birth annually.¹,² The Age-specific Fertility Rate
The Age-specific Fertility Rate (ASFR) in Indonesia for 15-19 years old group is 36 per 1000 women. 13.1 % of teenage girls aged from 15 to 19 give the first birth and 36.7% have already given birth before\(^1\).

In Riau, 8.7% of the similar age group are pregnant while 22.1% of them have already given birth before \(^5\). Even though the rate seems to be small, but it is actually higher compared to Indonesian Survey Demography and Health 2007 in which 1.9% of teenage girls give the first birth and 6.6% have already given birth before\(^6\). This is mainly caused by the rising number of sexually active teenagers.

The percentage of pre-marital sexual intercourse among teenagers aged between 15 to 19 years have increased from 4.5% to 3.7%. The lack of innovative teenage sexual counseling is shown by a low percentage of 45% of unmarried female teens aged from 15 to 19 years being acquainted with where to get teenage counseling service. Discussion partners that female teens like most are their friends of the same age (60%), mothers (44%), and teachers (43\%)\(^6\,4\).

Life skills and self-efficacy of Indonesian teenagers are still considered low. Teenagers with lack of life skills are more likely to be influenced by their peers, in this case, to have sex before marriage\(^7\). It is indicated by teenagers’ most common reasons to have sexual intercourse: being curious (57.5% of male teens), letting it happen (38% of female), and being forced by a partner (12.6% of female)\(^8\). Teenage pregnancy often leads to a high rate of maternal and infant mortality, and high-risk infants.

The strategies to decrease the rate could be performed by giving education, promoting positive attitude and self-development, and providing health services\(^9\). These strategies have been proven to successfully help to bring down the rate to be 82% of the teenage pregnancy across the USA and in some of the states\(^10\).

All the data revealed above lead to a question: is there correlation between life skills and self-efficacy with teenage pregnancy?

### Material and Method

This was correlational research with cross-sectional approach. It involved 126 third-grade students of a public senior high school in Pekanbaru. Samples were taken by using stratified random sampling. The illustrative questionnaire was being used for interviewing the students. The data was taken for 3 day, 2 July, until 4 July, 2018. The correlation between variables was tested using chi square. This study has been approved by the committee of research ethics, Faculty of Medicine, Andalas University (approval number 480/KEP/FK/2018).

Table 3 shows that there is a correlation between life skills with the risk of teenage pregnancy in Pekanbaru. It is indicated by the result where p-value: 0.002 < α (0.05) and OR: 3.433, meaning that teenagers with poor life skills have three times greater risk of pregnancy compared to the ones with good life skills.

There is a correlation between self-efficacy with risk of teenage pregnancy. It is indicated by the result where p-value: 0.000 < α (0.05) and OR: 6.000, meaning that teenagers with low self-efficacy have six times greater risk of pregnancy compared to the ones with high self-efficacy (see Table 3).

Discussion

The study revealed that 76 out of 126 samples are 16 years old (60.3%). Teenagers are going through their life searching for self-identity. During this period, they are experiencing various physical changes and are often very curious about everything new to them, which affect their emotional state. They experience identifiable changes in their sexual organ, they begin to feel how beautiful it is to fall in love with somebody, and often they have a high sexual desire. Curiosity to get new experiences is a leading factor which drives teenagers to commit high-risk behaviors. Teenagers aged 16 to 18 years, categorized as mid-teen, start to develop new behavior and way of thinking while searching for self-identity. They learn to make their own decision, and they start to have sexual imagination. Furthermore, the acceptance from and being interested in opposite-sex individuals become a very important thing to teenagers. Age may describe one’s maturity in deciding on what and how to act in life. The older the age, the more matured someone in making a choice.

The researcher assumes that mid-teens are still unstable and easily influenced. This assumption comes from the facts that teenagers are searching for identity, very curious and courageous to risk themselves since they think that they have the freedom to do anything they want to. 71 of the samples still have poor life skills (56.3%). Life skills are tools and instrument for every individual to adapt and behave positively, which allow him or her to effectively encounter any demand and challenge in life. A life skill is a knowledge which helps someone to implement their skill and knowledge to live a healthy life. Teenagers are required to learn to be independent in positive ways of learning. However, if this demand is not completed, they may experience psychological problems in the future. These problems are also affected by teenagers’ inability to make a decision. A problem that they must be ready to face in the future is the presence of various options for everything ranging from the simplest to the most complicated ones. Based on the questionnaire result submitted from the samples, teenagers with good life skills are the ones who have the capability to think positively. They spend their free time with meaningful activities and reject negative influence from their environments. In contrast, teenagers with poor life skills are indicated by lack of self-confidence, lack of ability to make a decision, and tend to easily accept negative influence. That is the reason why teenagers with poor life skills have the probability to perform such negative behavior which could harm themselves and other individuals.
Most of the samples of this study have low self-efficacy: 80 persons (63.5%). Self-efficacy is someone’s belief in his or her ability to empower motivation, cognitive resources, and a series of action considered necessary to cope with any situation he or she is experiencing\textsuperscript{16}.

Self-efficacy is developed from gradual skill growth along with continuous experiences. Self abilities that someone has gained draw self steadiness and confidence which he or she can utilize to achieve goals with maximum efforts\textsuperscript{17}.

The questionnaire result shows that teenagers with high self-efficacy have higher confidence and better behavior compared to teenagers with low self-efficacy.

The study also revealed that 66 samples (52.4%) are at risk of pregnancy. Free sex has become one of which causes the risk of pregnancy. Free sex comes from a teenager’s lack of family attention, curiosity, desire to do what most people do, poor life skills, and low self-efficacy\textsuperscript{18}.

Mass media also have an important role in shaping the risk of teenage pregnancy. Every media company knows what they should do to attract their audience’s attention including teenagers. The trending media for teenagers to follow most today are the electronics media\textsuperscript{19}. The researcher assumes that teenagers lacking family attention but having high curiosity without self-control ability are more likely to fall into free sex trap, which may attract the risk of pregnancy.

The result of this study indicates that there is a correlation between life skills with the risk of pregnancy on teenagers. (p-value: 0.002 < \(\alpha\):0.05) and OR value: 3.433 means that teenagers with poor life skills have a three times greater risk of pregnancy than the ones with good life skills.

Nowadays teenagers tend to respond permissively toward free sex. This is caused by the rapidly increasing number of teenagers who build a special relationship, which then widely opens the chance of premarital sex. It becomes worst when there are more people who tend to think that free sex is a small problem while it is actually a serious problem that everyone must avoid\textsuperscript{20}.

According to\textsuperscript{21} premarital sex among teenagers is provoked by myths which exist and are believed by some teenagers. Some young couples, for instance, believe that sexual intercourse is a proof of true love, while some others consider one-time sexual intercourse will not cause pregnancy.

This study reveals that there is a correlation between self-efficacy with the risk of pregnancy among teenagers in Pekanbaru. This is based on the result where p-value: 0.000 < \(\alpha\) so that H0 is rejected. OR value: 6.000 means that teenagers with low self-efficacy have a six times greater risk of pregnancy compared to the ones with high self-efficacy.

A high self-confidence drives teenagers to gain self-efficacy so that they have the courage to take responsibility for every decision they have made. They have a better understanding on the risk or the consequence of whichever action they take. This understanding can prevent themselves from risky behaviors including the risk of teenage pregnancy\textsuperscript{3}.

**Conclusion and Suggestion**

There is a significant correlation between the variables (life skills and self-efficacy) with the risk of teenage pregnancy. Future researchers are expected to conduct a further research project using quasi experimental design by including a more innovative health promotion with more interesting media considered to be more attractive to teenagers.

The Development of the Thesis-Writing Perfectionism Inventory

Diniy Hidayatur Rahman¹, Punaji Setyosari², Adi Atmoko², Nur Hidayah²

¹Student of Doctoral Program of Universitas Negeri Malang, Indonesia, ²Faculty of Education, Universitas Negeri Malang, Indonesia

Abstract

Previous studies proved that perfectionism is one of the factors causing procrastination in thesis writing. Unfortunately, no inventory that specifically measures perfectionism in the context of thesis writing had been developed. Therefore, this study aimed to develop an inventory of thesis-writing perfectionism that meets several psychometric requirements. The inventory was constructed through four steps: (1) specifying the construct of perfectionism; (2) constructing the measurement model; (3) performing confirmatory factor analysis; and (4) testing the validity of the measurement model. 200 subjects were involved in the study. The validity and reliability of the inventory were examined using exploratory and confirmatory factor analysis and Cronbach’s alpha. These steps successfully validated 10 of 20 initially constructed items.

Keywords: Perfectionism, procrastination, thesis writing, assessment, research and development.

Introduction

Procrastination in academic tasks can be found widely in many education settings. A study reported 40–50% of students to be in the chronic level of procrastination (1). In detail, it was also reported that 87% of students have delayed in preparing and submitting their assignments, 68% in presenting assignments, and 62% in preparing themselves for the exam (2). Moreover, other studies conducted in Indonesia also affirm similar results. A study conducted in Universitas Surabaya found that 30.9% of 316 subjects conducted academic procrastination at high to very high level (3). A similar research conducted in Universitas Pendidikan Indonesia also discovered that 44.08% of students were always procrastinating, 53.55% occasionally procrastinating, and only 2.07% never procrastinating (4).

One of the most often postponed academic assignments by undergraduate students is thesis writing. According to data obtained from the Office of Information Center of Universitas Negeri Malang in January 2018, there are 3,687 (12.45%) of 29,613 bachelor’s degree students were delaying their graduation. 96% of them graduated late due to their procrastinated thesis writing. Moreover, it was also reported in a study conducted in Institut Agama Islam Negeri Antasari that thesis writing was one of the factors delaying the graduation of the students (5). The similar result was also observed at the Faculty of Psychology, Universitas Surabaya (6).

Perfectionism is one of the predictors of procrastination. Several studies showed that it has a direct effect on procrastination (7,8). Other studies also proved that perfectionism is a good predictor of academic procrastination through self-efficacy (9), self-regulation (10), and motivation (11). Based on the studies, it can be concluded that perfectionism is one of the variables that must be considered in the procrastination intervention.

Unfortunately, there are no assessment tools that can measure the perfectionism in the context of thesis writing specifically. The existing perfectionism scales only measure the perfectionism in the general context (12–15). The scales are widely used in various research and counseling/psychotherapy services and have adequate psychometric eligibility in their own respective contexts. However, because of the general

Based on the discussed background, this study aimed to develop a scale called the Thesis-Writing Perfectionism Inventory (TW-PI). The inventory was developed based on the construct of self-oriented perfectionism proposed by Hewitt & Flett\(^{(12,16)}\) and two main indicators of perfectionism proposed by Rice, et al.\(^{(17)}\) High standard refers to an individual’s tendency to adhere to standards that are excessively high about his/her performance, while discrepancy refers to the belief that he/she will find the standards difficult to achieve. In order to measure the perfectionism in thesis writing context specifically, the items of the TW-PI was constructed in the context of thesis writing.

**Material and Method**

The study applied research and development design. To develop the scale, the study followed the steps of: (1) defining the construct of perfectionism; (2) developing the construct measurement model; (3) conducting confirmatory factor analysis (CFA) to empirically evaluate whether the developed construct confirms the theory or not; and (4) evaluating the validity of the measurement model\(^{(18)}\).

200 undergraduate students of Universitas Negeri Malang (UM) writing their thesis participated in the study. The number was obtained by multistage cluster sampling. Firstly, the researcher identified the number of students writing the thesis in eight faculties at UM. Based on subjects grouping according to their faculties, 25% of departments from each faculty were randomly chosen as representatives of the faculties. Finally, the researcher randomly selected 200 students writing the thesis in the representative departments to determine the final sample. Selected subjects were then contacted by telephone or email to fill out the online or offline prototype of the scale.

The construct validity of the scale was evaluated using the exploratory factor analysis (EFA) by checking the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO-MSA) value. If the KMO-MSA value is $\geq 0.5$ with $p \leq 0.05$, the analysis can be continued. In addition, if the value of the MSA for a particular item is $\geq 0.5$, it can go for further analysis. The next step is extracting the eligible items with the varimax method. The item that has a loading of $\geq 0.5$ for an indicator will be regarded as a good item. However, the item will be regarded as not meeting the theoretical assumptions if it is extracted into an incorrect indicator. Thus, the item must be discarded even though it has a loading of $\geq 0.5$ statistically. Furthermore, indicators that have a loading of $\geq 0.5$ for a developed construct will be determined as an eligible indicator. Valid items and indicators based on the EFA will then be tested for their reliability with the Cronbach’s alpha. The coefficient of Cronbach’s alpha used in the study is $> 0.7$. The next is performing CFA with a second-order technique. The analysis will test the unidimensionality of the TW-PI. In this study, it will be determined by The Root Mean Square Error of Approximation (RMSEA) of $\geq 0.08$. The validity of an item for an indicator and an indicator for a construct will be determined by the Lambda of $\geq 0.4$.

Favorable Items: 1-10; Unfavorable Items: 11-20

Findings

The Initial Blueprint of the TW-PI: Based on the review of the main indicators of perfectionism and the context of thesis writing, the researcher constructed 20 items extracted from two indicators: high standards and discrepancy. Detailed descriptions of indicators and items are displayed in table 1. Four Likert answer choices were provided for each of these items, ranging from disagree to strongly agree.

The Result of EFA, Cronbach’s Alpha, and CFA: The EFA of 20 items of the TW-PI showed that the ten of them had a loading factor of ≥0.5, while the other ten (items 1, 2, 3, 4, 5, 6, 7, 8, 9 and 10) had a loading factor of < 0.5. Therefore, the ten were categorized as valid items, while the rests were invalid. Likewise, both TW-PI indicators had a loading factor of 0.758 on the Thesis-Writing Perfectionism variable. The EFA also grouped the ten valid items into two appropriate indicators. Items 11, 12, 13, 14 and 15 were grouped in high standard, while items 16, 17, 18, 19 and 20 in discrepancy. Cronbach’s alpha analysis was then performed on the ten to evaluate their reliability. The result showed that the items were completely reliable since they have the Cronbach’s alpha coefficient of > 0.7. The detail results are summarized in table 2.

The items were then tested using CFA to evaluate the unidimensionality of the measurement model and the validity of each item. The details of the results are shown in table 2. It can be seen in table 2 that the RMSEA was 0.073 which means that the measurement model was good. The value of Chi-Square was 201.41 with a probability of 0.05303 which means that the measurement model had obtained adequate empirical support. Furthermore, The Lambda of all items and indicators was > 0.4, which means that the items and indicators were valid.

Discussion

Perfectionism is individual’s tendency to set high standards excessively for him/herself so that it makes him/her hesitant to act immediately. He/she demands him/herself to always be competent, great, and excel in all fields he/she considered important. This definition refers to the unidimensional construct of perfectionism. However, after 1990s, the concept of perfectionism shifted from unidimensional to multidimensional. One of the most popular concepts of multidimensional perfectionism is that put forward by Hewitt & Flett and Frost, et al. (12,16). Hewitt & Flett said that perfectionism has three dimensions: (1) self-oriented perfectionism; (2) other-oriented perfectionism; and (3) socially prescribed perfectionism. In another side, Frost et al. also stated that it has six dimensions: (1) concern over mistakes; (2) doubts about action; (3) personal standards; (4) parental expectations; (5) parental criticism; and (6) organization. Compared to the dimensions proposed by Hewitt & Flett which contain the classification of the actors of perfectionism, the dimensions by Frost, et al. seems to explain the indicators of perfectionism. However, Egan, et al. criticized these dimensions because they do not represent the core dimensions of perfectionism. They categorized parental expectation and parental criticism as causes of perfectionism and not the perfectionism itself. Concern over mistakes and doubts about action were also criticized because both were considered to be a same construct so they must be put together. Furthermore, Frost et al. also doubted organization as a dimension of perfectionism. In conclusion, the remaining two dimensions are considered to be the core dimensions of perfectionism, namely: (1) the combination of concern over mistakes and doubts about action; and (2) personal standards.

The results of the study reinforce the criticism of Egan, et al. that the six indicators of perfectionism proposed by Frost et al. are not entirely correct. Confirming the criticism, the results of this study show that high standards and discrepancy (the combination of concern over mistakes and doubts about action) have a high loading factor for the thesis-writing perfectionism variable. Therefore, these two indicators are appropriate to represent the thesis perfectionism construct. This is also proven by items grouping on the two appropriate indicators which means that the items are extracted correctly from the two. These results confirms the previous research by Rice, et al. that found high standards and discrepancy as the main dimensions of perfectionism.

Psychometrically, the TW-PI has conditions that must be owned by a scale. The results of EFA, CFA, and Cronbach’s alpha showed that the scale is valid and reliable. When compared to similar instruments, this scale has the advantage of a small number of items. That way, the scale can serve simple assessment that is increasingly needed lately. As known, counseling services which lately tend to be brief require assessment instruments that are also brief and simple. However, because the TW-PI is in its early stages of development, one of its shortcomings is that it has not been proven to...
correlate with a similar scale. Therefore, the convergent validity of this scale is still unknown. The task of the next research is to examine the correlation of the TW-PI with other similar scales.

**Conclusion**

The development and validation process of the TW-PI had selected ten valid and reliable items and eliminated the other ten that do not meet the psychometric requirements. These items are only intended to measure the level of perfectionism in the context of thesis writing. Therefore, the score resulted is the total score of perfectionism in thesis writing. The higher the score, the higher the perfectionism tendency of the subject. On the contrary, the lower the score the lower the perfectionism tendency. Compared to similar instruments, the TW-PI has several advantages: (1) it only contains 10 items so that it is very efficient to use; and (2) it is very appropriate to be used in counseling setting. One of the disadvantages of the TW-PI is the number and homogeneity of the samples used in the development process. This sample number limits the use of the TW-PI only to the population of subjects involved.

Abstract

Schizophrenia is a chronic disorder that could cause a high morbidity and mortality. This study aimed to determine the effectiveness of combination therapy of risperidone, group psychotherapy, and occupational therapy on cognitive functions and quality of life of schizophrenia patients. The study compared the score of Schizophrenia Cognition Rating Scale of Indonesian version (SCoRSVI) and the score of the World Health Organization Disability Assessment Schedule (WHODAS 2.0) between schizophrenia patients who received the occupational therapy (occupational therapy group) and those who did not received occupational therapy (control group). This study was a longitudinal analytic study with a prospective cohort approach which was conducted at South Sulawesi Province Special Hospital (RSKD). Each group consisted of twenty-two schizophrenia patients who were hospitalized for the first time from June to August 2018, and were divided by randomized consecutive sampling technique. Our findings indicated that the comparison of SCoRSVI and WHODAS 2.0 scores between Occupational therapy group and the control group were significant on the eighth week (p = 0.03 and p = 0.010, consecutively). Result showed that the occupational therapy was effective when combined with antipsychotic therapy and the group psychotherapy to improve cognitive function and the quality of life of the schizophrenia patients, especially in long term therapy.

Keywords: Schizophrenia, group psychotherapy, occupational therapy, cognitive function, quality of life.

Introduction

Schizophrenia is a clinical syndrome of psychopathology that can be classified into positive symptoms, negative symptoms and disorganize symptoms. In 2013, Indonesian Health Research data showed that the prevalence of severe mental disorders in Indonesia such as schizophrenia reaches approximately 400,000 people or 1.7 per 1000 population. Moreover, 1% of the population in the world suffered from schizophrenia.¹,² Furthermore, schizophrenia is a chronic disease that could cause quite high morbidity and mortality, which end to a high medical cost. Morbidity and medical costs of relapse schizophrenia patients are greater than in the first episode of schizophrenia. The consequences are loss of daily productivity, poor response to treatment, longer period of treatment, longer time to achieve remission, and greater costs for treatment.

Cognitive function and the severity of negative symptoms are most often associated with the occurrence of dysfunction in the social ability.³ Cognitive dysfunction has direct impacts on a personal social performance and social function which result in an inability to work or perform daily activities that could cause poorer quality of life. The quality of life itself can be defined as subjective and objective perceptions of individuals regarding their physical, psychological,
social and environmental conditions which they experience in their daily lives. In fact, the treatment for cognitive dysfunction have not been optimally studied and often ignored in many Health Service Institutions in Indonesia. Previous study indicated that schizophrenia patients who received group psychotherapy as an adjuvant therapy to risperidone showed improvement in clinical symptoms better than the control group who only received risperidone.

Recently, approach to schizophrenia patients includes multi-dimensional interventions to reduce the abnormal behaviors in various domains. Rehabilitation, as one of the approaches, is the process of refocusing and redeveloping to improve their psychological, social and occupational function. Occupational therapy is one of the medical rehabilitation for physical and mental disorders patients which combine the art and science to lead patients to selective activities in order to improve and maintain their health, as well as to prevent disability through various activities and work.

It is believed that the most effective way to handle patients with schizophrenia is by combining psychopharmacology with psychosocial interventions such as psychotherapy, family therapy, and occupational therapy. There have been several studies shown a significant relationship between cognitive function and the quality of life in schizophrenia patients, and many researchers had try to intervene with various modes of therapy to improve cognitive function and the quality of life of schizophrenia patients. However, there is no study has been carried out to assess the effect of occupational therapy on schizophrenias in combination with group psychotherapy, in terms of cognitive function and their quality of life. This study aimed to determine the effectiveness of the combination therapy of risperidone, group psychotherapy, and occupational therapy on cognitive function and the quality of life of schizophrenia patients.

**Materials and Method**

This study is a longitudinal analytic study with a prospective cohort approach which was conducted at South Sulawesi Province Special Hospital (RSKD) from June to August 2018.

The subject of this study were schizophrenia patients who were hospitalized in the RSKD from June to August 2018 who met the inclusion criteria and were given group psychotherapy and were treated with risperidone.

The demographic data of the subject was collected, then the baseline cognitive function were assessed using the Indonesian version of the SCoRS instrument and the quality of life using WHODAS 2.0. Clinical interviews was conducted to determine abstract thinking abilities and creative talent. The occupational therapy was given by psychologists and occupational therapists from the South Sulawesi Special Hospital. Cognitive function (SCoRSVI) and quality of life (WHODAS 2.0) were assessed on the 4th week or 12 sessions of the occupational therapy and on the 8th week or 24 sessions of the occupational therapy. The differences between the scores of SCoRSVI and WHODAS 2.0 in control group and experimental group were evaluated from the baseline, on the 4th week and on the 8th week of the study. Data were collected and processed using computer programs, using statistical univariate and bivariate analysis.

**Results**

There were 27 subjects received risperidone therapy, group psychotherapy and occupational therapy and 25 subjects only received risperidone therapy and group psychotherapy who met the inclusion criteria. Five subjects from the occupational therapy group and 3 subjects from the non-occupational therapy group were excluded because the family decided to take them home.

The comparison of SCoRSVI score in the baseline between the occupational therapy group with the non-occupational therapy group was not significant with p = 0.500. After 4 weeks of therapy, the comparison of SCoRSVI score between the occupational therapy group and the non-occupational therapy group remained not significant with p = 0.157. The comparison of SCoRSVI score between the occupational therapy group and the non-occupational therapy group was significant after 8 weeks of therapy with p = 0.03. The decrease in SCoRSVI score between the occupational therapy group and the non-occupational therapy group showed more significant differences after 8 weeks of therapy (Table 1).

Wilcoxon Sign Rank Test. *non-occupational therapy group, **occupational therapy group.

Discussion

In this study, the occupational therapy group received risperidone therapy, group psychotherapy and occupational therapy 24 times over 8 weeks. In the non-occupational therapy group, only received risperidone therapy and group psychotherapy. Occupational therapy is generally given 1-3 times a week, 1-3 hours per session from 6 weeks to 6 months.\(^9\),\(^10\),\(^11\) Gender distribution showed more male (68.2%) in the occupational therapy group, and the same percentage between men and women (50%) in the non-occupational therapy group. This was in accordance with the literature that schizophrenia was more commonly occur in men than in women.\(^12\),\(^13\)

Wilcoxon Sign Rank test showed a significant differences in the SCoRSVI score between the baseline and the 4th week (p = 0.000), as well as between the 4th week and the 8th week (p = 0.000), either in the occupational therapy group or in the non-occupational therapy group. Wilcoxon Sign Rank test showed significant differences in WHODAS 2.0 score between the baseline and the 4th week (p = 0.000) as well as between the 4th week and the 8th week (p = 0.000),
either in the occupational therapy group or in the non-occupational therapy group. This describes that from the baseline, the 4th week and the 8th week, either in the occupational therapy group or in the non-occupational therapy group, had shown significant improvements in cognitive function and the quality of life. According to the Wilcoxon Sign Rank test, there were significant differences in the SCoRSVI score at the baseline to the 4th week (p = 0.000) and at the 4th week to the 8th week (p = 0.000), either in the occupational therapy group or in the non-occupational therapy group. Similarly, Wilcoxon Sign Rank test showed significant differences in WHODAS 2.0 scores at the baseline to the 4th week (p = 0.000) and at the 4th week to the 8th week (p = 0.000), either in the occupational therapy group or in the non-occupational therapy group. This indicates that from the baseline to 4th week then to the 8th week, either in the occupational therapy group or in the non-occupational therapy group, had shown significant improvements in cognitive function and the quality of life.

However, comparison of the mean scores difference between SCoRSVI and WHODAS 2.0 in the occupational therapy group and the non-occupational therapy group, from the baseline and from the 4th week to the 8th week, showed a significant results were p≤0.000. This showed that treatment with risperidone therapy, group psychotherapy combined with occupational therapy was more effective in improving the clinical symptoms of schizophrenia disorder than if it were only given risperidone therapy with group psychotherapy. This support the theory that our brain stores information by modifying neuronal connections

**Conclusion**

It was concluded that there was an improvement in cognitive function and the quality of life in both the occupational therapy group given risperidone therapy combined with group psychotherapy and occupational therapy, as well as the non-occupational therapy group given risperidone therapy with only group psychotherapy combination. The improvement of cognitive function and the quality of life in the occupational therapy group was better than the non-occupational therapy group. Occupational therapy was effective when combined with antipsychotic therapy and group psychotherapy in improving cognitive function and the quality of life. Further study was recommended in comparing occupational therapy on schizophrenia patients between hospitalized and non-hospitalized ones. It is important to conduct study in comparing the effectiveness of occupational therapy with other psychotherapeutic modalities in schizophrenia patients. It was also important to evaluate patient condition after therapy and how they interact with their environment. Hospital and government health insurance needs to consider carrying out occupational therapy in hospitalized schizophrenia patients because it could shorten the length of stay in the hospital.

Compliance with the Baby Friendly Hospital Initiative Program in Two Hospitals Designated “Baby-Friendly” in Kirkuk City, Iraq, an Evaluation Study

Fakher Abobaker Ahmed, Dale Spence, Finoa Lynn, Richard Tubman, Ziad Mohammad Sadiq

Abstract

Background: Although the Baby Friendly Hospital Initiative (BFHI) was implemented in Iraq since 1992, a remarkable regression in exclusive breastfeeding has been highlighted by UNICEF (2011). Kirkuk province has experienced the lowest rate of breastfeeding initiation in the first hour of life, with higher neonatal and under five years mortality rates. International organizations have recommended a focus on breastfeeding practices and strengthening the implementation and monitoring of BFHI program in Iraqi provinces.

Method: Two-phase study was carried-out in two-designated Baby-Friendly hospitals (Azadi Teaching Hospital and Kirkuk General Hospital), using a standardized questionnaire. Monitoring BFHI tools utilised to measure the compliance with BFHI. Carolina B-KAP survey questionnaires were used to assess knowledge, attitudes, and practices of clinical and non-clinical staff and to measure the components of Organisational Readiness for Change (ORC) theory through practical and theoretical knowledge of hospitals processes. The Chi-square test of independence was performed to test for group differences in the responses to the Carolina B-KAP questionnaire.

Results: There was compliance in both hospitals with step 1, 7 and 10 of the Ten Steps to Successful Breastfeeding, and the International Code of Marketing Breastmilk Substitutes (the Code). However, a non-compliance with step 3, 4, 5, 6, 8 and 9 were present. KGH also showed non-compliance with step 2 (training on BFHI). A total of 143 participants (124 clinical and 19 non-clinical) responded to the survey. ATH were more likely to have greater knowledge of infant feeding, than respondents working in KGH (p < 0.05). Responses indicated that (61.7%) of participants reported that healthy full-term newborns within their care had started to breastfeed within 60 minutes after birth. In terms of matching infant feeding with appropriate clinical support plans, the results show that respondents agreed or strongly agreed on the need for additional guidance and training (78.3%).

Conclusion: Increased compliance with the BFHI programme can have positive impact on breastfeeding initiation, duration and exclusivity. Maternity departments in Kirkuk hospitals must fully implement Baby Friendly Hospital Initiative to support an increase in exclusive breastfeeding rates. Also, implementation of Baby Friendly Community Initiative (BFCl) can provide community support for breastfeeding.

Keywords: Baby Friendly Hospital Initiative (BFHI), the Ten Steps to Successful Breastfeeding, International Code of Marketing Breastmilk Substitutes (the Code), Organisational Readiness for Change (ORC).

Introduction

The Baby Friendly Hospital Initiative (BFHI) is evidence-based practice programme initiated in 1991 by the United Nations Children’s Fund (UNICEF) and World Health Organisation (WHO), and its designated to increase the rates of initiation, duration and exclusivity...
of breastfeeding worldwide. BFHI consist of the Ten Steps for Successful Breastfeeding, and the International Code for Marketing of Breastmilk Substitutes which is a key element of the international standard for promoting, protecting and supporting breastfeeding. The BFHI assessment process, otherwise known as the BFHI designation process or accreditation, consists of a set of tools initiated in 1991 and revised and updated in 2006 to 2009. This process was designed based on the BFI quality cycle (Figure 1). Changing staff attitudes continues to be the greatest challenge to those hospitals that wish to achieve Baby-Friendly certification. Organisational readiness for change (ORC) is key factor in the effective implementation of new strategies, programs and practices in healthcare facilities. ORC embodies two important principles for the implementation of change, collective efficacy and collective commitment.

Figure 1: Baby Friendly Initiative quality cycle. (p.5)

The BFHI was first implemented in Iraq in 1992, including the city of Kirkuk. The Multiple Indicator Cluster Survey (MICS4) conducted by UNICEF indicated a marked regression in breastfeeding since 2004 with record low rates of exclusive breastfeeding and duration of breastfeeding at 19.6% (as compared with 30.9% in 2004) and 13.8% (as compared with 15% in 2004), respectively. Kirkuk province had lower initiation rate of breastfeeding within one hour (10%) than in any other Iraqi province, while the mortality rate for children under five (51 per 1,000 live births) was higher in Kirkuk than in any other Iraqi provinces and the neonatal mortality rate was 32%. The evidence-based report by the U.S. Agency for International Development (USAID) stressed the importance of conducting a study into breastfeeding practices in health institutions and communities in Iraq, and proposed a further evaluation of the BFHI in Iraq. This also recommended by a report by the International Baby Food Action Network (IBFAN).

Two main gaps have been identified through the literature review. First, there is a dearth of studies which apply Organisation Readiness for Change (ORC) theory to assess clinical and non-clinical staffing levels required to deliver the BFHI programme. Second, few researchers have sought to understand how the organisational cultures of individual hospitals influence compliance with the Ten Steps to Successful Breastfeeding and the Code. The aims of this paper, therefore, are as follows:

1. To determine if the two BFHI designated hospitals in Kirkuk have sustained adherence to the Ten Steps to Successful Breastfeeding and the Code.
2. To assess the levels of support reported by clinical and non-clinical staff to successfully deliver the BFHI programme.

Material and Method

A quantitative approach was carried out in the maternity departments of two public hospital, Azadi Teaching Hospital (was accredited as a Baby Friendly Hospital in June 2014) and Kirkuk General Hospital (was in the final stage of accreditation), in the city of Kirkuk, Iraq. Both hospitals had high birth rates (13,000 and 15,000 births respectively in 2014).

The standardized instrument Monitoring Baby Friendly Hospitals tools, gathered hospital level data regarding the implementation of BFHI. This mechanism was used to confirm the hospital’s commitment to Step 1 (policy) and Step 2 (training) of the Ten Steps to Successful Breastfeeding and the Code. The questionnaires for breastfeeding mothers [interview of 60 postpartum mothers (experienced vaginal birth or caesarean section birth) across the two participating hospitals through stratified sampling on random basis] were used to confirm the hospital’s commitment to the Steps 3 to 10, of the Ten Steps.

A survey utilized Carolina B- knowledge, attitudes and practices (Carolina B-KAP) questionnaires Nickel were used to assess these aspects in clinical and non-clinical staff (were 125 employees in ATH and 105 in KGH by using self-selecting convenience sample) in relation to the BFHI, and to measure the components of Organisational Readiness for Change (ORC) theory through practical and theoretical knowledge of hospitals processes.
**Data Analysis**

Descriptive statistics were utilised as per the UNICEF/WHO guidance for data analysis. Summarising the data and interpretation of the finding of the Monitoring Baby Friendly Hospital tool, including the questionnaire for breastfeeding mothers, was undertaken to identify the level of the hospital’s adherence with BFHI steps. The data from Carolina B-KAP questionnaires were entered and analysed by the researcher using SPSS program.

**Findings:** The results of Monitoring Baby Friendly Hospitals tool revealed a partial commitment to providing maternal and infant health services under the BFHI program in Azadi Teaching Hospital (ATH), (Table 1) and Kirkuk General Hospital (KGH) (Table 2).

Survey results: The response rate was 62% across both hospitals with 143 participants in total (124 clinical and 19 non-clinical staff).

Knowledge of infant feeding: The results in (Table 3) show that for items 1-3 and 6, respondents working in ATH were more likely to have greater knowledge of infant feeding, as they responded correctly to these items, than respondents working in KGH (p < 0.05).

Table 3: Group differences in knowledge of infant feeding: ATH versus KGH.

(77.4%, n = 96) always recommend breastfeeding to the mothers in their care who have not decided how to feed their babies. Responses indicated that (61.7%, n = 58) of participants (out of 88 participants involved with Labor and delivery care) reported that healthy full-term newborns within their care had started to breastfeed within 60 minutes after birth.

Attitudes toward commitment and ability in the workplace: The participants responded to 15 questions which measured the components of Organisation Readiness for Change (ORC) across five categories. The first category related to their opinion about clinical staff in the maternity facility where they work and whether they needed additional guidance (Table 4). In terms of matching infant feeding with appropriate clinical support plans, the results show that respondents agreed or strongly agreed on the need for additional guidance or training (78.3%, n = 112).

Discussion

Increases in exclusive breastfeeding rates are associated with high compliance with BFHI practices. Participated hospitals in this study showed non-compliance with many steps of the Ten Steps to Successful Breastfeeding. Specifically, a non-compliance in KGH in relation to step 2 was due to the low proportion of clinical staff who had participated in the training courses, which was below the required rate set by the UNICEF and WHO guideline.

There was a non-compliance in both hospitals with Step 3. Given that the total number of births in both hospitals for 2014 exceeded 28000, a small prenatal clinic in both hospitals cannot be expected to cover Step 3. This finding is consistent with the result obtained by Zakarija-Grkovic as a minimum compliance with the same step was reported.

The knowledge of participated hospitals staff was varied according to the hospitals as there is a gap in knowledge to support breastfeeding, respondents working in ATH were more likely to have greater knowledge of infant feeding. This can be linked to lack of training in KGH when that hospital showed non-compliance with step 2 of the BFHI. A study on BFHI confirmed that lack of health training affects the rate of correct answers on breastfeeding knowledge.

The rate of initiation of breastfeeding (within first hour of birth) in accredited (BFHI) hospitals is greater than those of non-accredited. Based on the opinion of staff working in labour and delivery care, our findings showed that up to 61.7% of healthy, full-term newborns initiate breastfeeding within the first hour of birth. This rate is significantly associated with respondents from KGH (p < 0.05). A survey in the District of Shaqlawa, Erbil, Iraq, found a statistically significant relationship between delivery in BFHI hospitals and initiation of breastfeeding.

Readiness in healthcare organisations is required before implementing evidence-based interventions. Changing staff attitudes requires time and remains the greatest challenge for those wishing to attain Baby Friendly certification. Our findings indicated that the clinical staff require more guidance, training and skills in terms of matching infant feeding plans with appropriate clinical support plans (78.3%). This result was significantly associated with the respondents working at KGH, and those in the age group 31-40 years (p < 0.05).

Conclusion

Maternity departments in Kirkuk must fully implement Baby Friendly Hospital Initiative. Organisational Readiness for Change is vital in successful
implementation of the BFHI. Training on BFHI develops the knowledge and skills of staff concerned. Community support of optimal breastfeeding practices in Kirkuk is needed through implementation of the Baby Friendly Community Initiative (BFCI) to increase the rates of exclusive breastfeeding at six months.

Conflict of Interest: Nil

Abstract

\textbf{Background:} Today, workplace stress is a scourge that has serious individual, organizational, social and economic consequences.

\textbf{Objective:} This study aims to understand the phenomenon of burnout among health professionals at EL Idrissi Hospital in Kenitra.

\textbf{Materials and Method:} This is a cross-sectional descriptive study carried out at El Idrissi Hospital in Kenitra, Morocco, on burnout, using the Maslach Burnout Inventory (MBI) adapted for health personnel.

\textbf{Results:} Out of the 70 questionnaires sent to health professionals at Idrissi Hospital, 65 respondents, including 13 doctors (20%) and 52 nurses (80%). The average age of the respondents is \(41 \pm 1.32\) years, with a minimum age of 22 years and a maximum age of 59 years. The results of the Maslach Burnout Inventory show that 22 out of 65 respondents (33.85\%) are people with a high degree of emotional exhaustion, thus a high degree of depersonalization and a low degree of achievement. So we can consider these people as pathological cases. A high emotional exhaustion score was observed in 55.4\% of respondents and a high depersonalization score in 40\%, while a low degree of achievement with a percentage of 66.1\%.

\textbf{Conclusion:} From our results, we have found that burnout is a real threat to the mental health of health professionals at the el idrissi de kenitra hospital. intervention by higher authorities is essential to combat this problem.

\textbf{Keywords:} Professional burnout, Maslach, Health professionals, Morocco.

Introduction

According to Maslach \& Jackson, burnout is mental and physical exhaustion for people whose work requires constant contact with others\textsuperscript{1}, caused by exposure to emotionally demanding work situations\textsuperscript{2}.

In 2016, Maslach \& Leiter defined burnout as an inadequate response to chronic stress consisting of emotional exhaustion, depersonalization, and reduced personal accomplishment. Emotional exhaustion refers to the decrease and loss of emotional resources, the feeling of being emotionally exhausted due to work, along with the feeling that one has nothing to offer psychologically to others\textsuperscript{3,4}. Depersonalization consists of the development of negative attitudes and feelings and insensitivity and lack of compassion towards the people they serve. Reduced personal accomplishment at work is the tendency to evaluate oneself and one’s own work negatively, together with avoidance of interpersonal
relationships, low productivity and the inability to withstand pressure\textsuperscript{3-4}.

People who experience all three symptoms have the greatest degree of burnout, although emotional exhaustion has been identified as the hallmark of burnout, with health professionals being among those who experience it most frequently. Among the reasons for this, one should emphasize: increased stress as a result of the need to respond quickly to the needs of patients and families, the high stakes associated with their caregiving decisions that could result in harm to patients, and the work overload and the need for working long hours and often shiftwork in a complex working environment\textsuperscript{3-4}.

International epidemiological studies have focused on the extent of burnout in hospitals, such as: in Finland, 30.1\% of healthcare workers with burnout syndrome\textsuperscript{5} and in France, 5\% of general practitioners with burnout\textsuperscript{6}.

At the African level, a study carried out in Cameroon showed a burnout prevalence of 42.4\% among general practitioners in the city of Douala\textsuperscript{7}. In Morocco, a study carried out in four Moroccan hospitals among anaesthesia resuscitation staff shows that 70\% of respondents have professional exhaustion syndrome\textsuperscript{8}. Another study conducted on fifth-year medical students in Rabat showed that 44\% of medical students were highly exhausted\textsuperscript{9}.

Despite these studies, the number of works carried out at national level with carers remains relatively low and the studies are mainly descriptive. In this sense, the objective of our study is to assess the prevalence of burnout syndrome among healthcare professionals at Al Idrissi Hospital in Morocco.

Material and Method

Type and study area: This is a descriptive and analytical cross-sectional epidemiological study carried out during the months of April and May 2016, in the El Idrissi hospital in Kenitra, Morocco.

Sample: This study was conducted on 52 nurses and 13 physicians working full time in the hospital.

Assessments: Data collection was done through a questionnaire, distributed to health personnel with questions on identity and certain socioeconomic and socio-demographic characteristics, plus Maslach Burnout Inventory (MBI) test questions. This is the Maslach Burnout Inventory (MBI) version adapted to caregivers or MBI-HSS (“Human Services Survey”), which consists of 22 items with a 7-point rating (between 0 = never and 6 = sever several times a day), assessing how often the caregiver experienced the experience, feeling or emotion in question. These items allow nine of them to establish an emotional exhaustion score (numbered from 0 to 54), five other separate items define the depersonalization score (numbered from 0 to 30) and the last eight, that of personal achievement (numbered from 0 to 48)\textsuperscript{10-11-12}.

Emotional Exhaustion (EE): is assessed by items: 1, 2, 3, 6, 8, 13, 14, 16 and 20 (result between 0 and 54).
- Total less than 17: EE level low.
- Total between 18 and 29: moderate level of EA.
- Total greater than 30: high level of EE (pathologic)

Depersonalization (DP): is evaluated by items: 5, 10, 11, 15 and 22 (result between 0 and 30).
- Total less than 5: degree of low DP.
- Total between 6 and 11: moderate degree of DP.
- Total greater than 12: high degree of DP (pathologic).

Personal Achievement (PA): is assessed by items: 4, 7, 9, 12, 17, 18, 19 and 21 (result between 0 and 48).
- Total greater than 40: low degree of AP.
- Total greater than 34 and 39: moderate PA level.
- Total less than 34: high degree of AP (pathologic).

Statistics Analyses: The data collected are entered in Excel, after filtration have been transferred to a support of the SPSS software (trial version). These data are subjected to descriptive and analytical statistical analyses. A descriptive analysis is used to determine the socio-demographic profile. Thus, we used the analysis of multiple correspondences in order to determine the correlations between the different modalities studied.

Results

Sociodemographic characteristics of sample: Among 70 questionnaires sent to health professionals at the Idrissi hospital, 65 feedbacks including 20\% doctors and 80\% nurses, which correspond to a participation rate equal to 92.8\%. Indeed, out of a total of 65 interviewees
38.6% are in emergency / resuscitation, the others are distributed on the departments of surgery, radio and laboratories, as well as the departments of cardiology and maternity. The distribution is represented in a fair way between the female and the male sex, the frequencies are respectively 52.5% and 47.7%, with a sex ration equal 1, 1. The average age of respondents is 41 ± 1.32 years, with a minimum age of 22 years and a maximum age of 59 years (table 1).

</tr>
</tbody>
</table>

The projection of the different modalities of the variables that showed significant trends in space 1 and 2 of the multiple correspondence analysis is shown in Figure (1). This analysis reveals two groups:

- First group brings together people qualified as pathological and who are generally physicians in emergency, resuscitation and cardio services. These people are over the age of 45 so there is a high degree of emotional exhaustion, a high degree of depersonalization and a low degree of achievement.

- Second group consists of nurses under 35 years old who represent the surgical services and laboratories. These people are characterized by moderate degree of the three dimensions, so these are individuals to monitor.

- The third group consists of nurses with a high achievement and moderate exhaustion and depersonalization. They represent maternity services and are young people between 25 and 35 years old.

Discussion

This study examined the prevalence of burnout syndrome in population of healthcare professionals who work in the El idrissi Hospital in Kenitra, Morocco. We found that 33.85% of professionals were suffering from burnout syndrome. This result is in harmony with studies carried out on Tunisian healthcare populations with burnout rates ranging from 30 to 34% \cite{11-12}. At the national level, a study conducted on doctors in training at the Ibn Rochd University Hospital found that 31.8% of respondents with severe burnout were found to have this result in line with our study\cite{13}. On the other hand,
international studies that have shown small percentages of burnout such as Portugal\textsuperscript{16} and Ecuador\textsuperscript{17}. A possible explanation for these differences in prevalence are the differences in the social and economic situation surrounding the Moroccan health professional compared to other countries.

Considering the dimensions of burnout, in our study we noted a high level of emotional exhaustion and depersonalization was found in 55.4\% and 40\% of cases, respectively, while a low level of professional achievement was found in 66.3\% of cases; this result is in harmony with a Moroccan study on professional exhaustion in radiological settings\textsuperscript{18}, but with different results than those found in the literature\textsuperscript{19-20-21}. Along with, epidemiological studies have also found high rates of emotional exhaustion, depersonalization, and low personal accomplishment in healthcare professionals, ranging from 20.5\% to 59.0\% in emotional exhaustion, between 7.6\% and 61.0\% in depersonalization and between 16.7\% and 49.0\% in reduced personal accomplishment\textsuperscript{22-23-24}. A systematic search of MEDLINE/PubMed, PsychINFO/Ovid, Embase, CINAHL/EBSCO and Web of Science was conducted for original research published between 1997 and 2017, has demonstrated that the overall estimated pooled prevalence for emotional exhaustion was 40\% (CI 31\%–48\%) for depersonalisation was 22\% (CI 15\%–29\%) and for low levels of personal accomplishment was 19\% (CI 13\%–25\%)\textsuperscript{25}.

Burnout has serious effects on physical and psychological health. It is associated with cardiovascular disorders and musculoskeletal\textsuperscript{26-27}, as well as with depression, anxiety and alcohol addiction\textsuperscript{26, 28}. likewise, burnout is associated with high costs for society and organizations because it can result in personal and family deterioration\textsuperscript{29} and affects workers’ productivity\textsuperscript{30}. It is associated with higher medically certified sickness absence and absenteeism\textsuperscript{29} decreased job satisfaction and intention to leave the current job\textsuperscript{29, 31-32}. Furthermore, in the case of health professionals, burnout impacts the quality of care provided\textsuperscript{33}and patient satisfaction\textsuperscript{34}.

**Conclusion**

The results of this study showed that burnout is a real scourge that affects the psychological health of carers at El idrissi hospital in Kenitra, Morocco. for this reason, managers must carry out psychological awareness and support campaigns to minimize the risk among this working population.

**Significance Statement:** This study discovered the burnout syndrome among caregivers at El idrissi Hospital. That can be beneficial for health authorities. This study will help the researchers to uncover the critical areas of psychological health that many researchers were not able to explore. Thus a new theory on the assessment of burnout among caregivers in the Moroccan context may be arrived at.

**Conflict of Interest:** The authors declare that there are no conflicts of interest.

**Ethical approval:** The procedures were carried out in accordance with the recommendations of the Internal Ethics Committee of the Ibn Tofail University Kenitra. This procedure were examined and approved by the Committee.

Serum Ferritin Levels for Iraqi Patients with Hashimoto’s Thyroiditis

Inaam Ahmed Ameen¹, Eman Saadi Saleh¹, Kaled Nather Taha²

¹Department of Clinical Laboratory Sciences, College of Pharmacy, University of Baghdad, ²MOH / Medical City / National Center for Educational Laboratories, Baghdad, Iraq

Abstract

Background: The estimation of ferritin and related variables by complete serum iron profile, for Iraqi hashimoto’s patients to see the effect of thyroid hormone insufficiency, which may lead to deficiency of ferritin iron stores, this may be quite useful during the diagnosis and treatment of hashimoto’s patients.

Patients and Method: The study was performed at National Center of Teaching laboratories of Medical city institute in Baghdad. Fifty newly diagnosed patients with hashimoto’s and forty apparently healthy controls. Diagnosis based on thyroid profile analysis including: Thyroid Stimulating Hormone (TSH), Thyroxine (total T4) and Triiodothyronine (total T3), estimation of antibodies against thyroperoxidase, iron profile including: serum ferritin, serum iron, total iron-binding capacity (TIBC), unsaturated iron-binding capacity (UIBC) and Transferrin saturation (TSAT) for both groups.

Result: The hashimoto’s patients have elevated levels of anti-TPO, TSH, TIBC, UIBC and TSAT as compared with controls. Anti-TPO, TSH, UIBC and TSAT were significantly higher than that of controls, while TIBC is not significant. In other hand, hashimoto’s patients have lowered levels of Total T3, Total T4, Ferritin and Iron as compared with controls. Total T4, Ferritin and Iron were significantly lower than that of control, while Total T3 is not significant.

Conclusion: Statistical application for the current study by employing Receiver Operation Characteristic curve (ROC curve) shows the validity of anti-TPO in addition to serum iron and total T4 to be used as a biomarkers for detection of hashimoto’s thyroiditis.

Keywords: Hashimoto’s thyroiditis, Hypothyroidism, Iron, Ferritin.

Introduction

Ferritin is the major iron storage protein of the body. A small amount of ferritin released into the bloodstream and act to transport the iron to areas where it is needed(1). The free iron is toxic, it forms reactive oxygen species through Fenton reaction(2). Ferritin act as antioxidant by limiting the formation of reactive oxygen species, and modifying their damaging effect on cellular structures(3). Also it acts as a buffer against iron deficiency and iron overload(4), so it is used as a diagnostic test for iron-deficiency anemia(5), also reflect thyroid function(6) because, low ferritin (low iron), is one of the most important causes of low thyroid function(7). Iron is a component of many enzymes including thyroid peroxidase (TPO) which has a key role in the initial two steps in thyroid hormone biosynthesis(8). Serum ferritin levels must be healthy for optimal thyroid hormone levels(5). Reference ranges for blood ferritin is about 28 to 397 ng/ml for men, and 6 to 159 ng/ml for women. Blood ferritin below 12 to 30 ng/ml indicates depletion of iron stores (ferritin) and is a diagnostic criterion for iron deficiency(9). Subclinical hypothyroidism is associated with iron-deficiency anemia and lower ferritin levels(10). Hashimoto’s thyroiditis (chronic lymphocytic thyroiditis) is an autoimmune disorder that causes inflammation of the thyroid gland. Symptoms of Hashimoto’s thyroiditis...
are the same as hypothyroidism, and include feeling cold, dry skin, depression, fatigue, sleepiness, and weight gain. Patients with hashimoto’s thyroiditis typically show an increased number of antibodies against thyroid-specific proteins, including thyroperoxidase and thyroglobulin. T lymphocytes, invade the thyroid gland cause silent, painless inflammation that destroys it; ultimately, the individual produces little or no thyroid hormone and becomes hypothyroid(11). Gradual thyroid failure, due to autoimmune-mediated destruction of the thyroid gland involving apoptosis of thyroid epithelial cells, with high serum concentrations of antibodies against one or more thyroid antigens (12). Infiltrating lymphocytes show cytotoxic effect on thyroid follicular cells (TFC), alters its integrity and modulates their metabolic and immune function(13). HT is thought to arise from an interaction between genetic susceptibility factors, epigenetic effects and various environmental triggers (e.g. iodine, infection)(14)(15). Additional factors include stress, climate, age and gender. Both cellular and humoral immunity play a role in HT pathogenesis(13). During the early stage of thyroiditis, the levels of thyroid hormones (T3 and T4) may be normal. With chronic hypothyroidism, the thyroid hormone levels fall, and the level of thyroid-stimulating hormone (TSH) becomes high. Estimation of iron profile may be of help for HT.

Patients and Method

The study was performed at National Center of Teaching laboratories of Medical city institute in Baghdad. Fifty newly diagnosed patients with hashimotos (27males, 23females) and forty apparently healthy as controls (22males, 18females). Age range for hashimoto’s patients(18-64)years with mean age(36.79 ±13.94), age range for controls(18-48)years with mean age(28±8.49).The diagnosis was based on detailed history and thyroid profile analysis. In addition to the estimation of antibodies against thyroperoxidase, serum ferritin, serum iron, TIBC, UIBC and TSAT was carried for both groups. Enzyme immunoassay (Gen Way Biotech Inc.) for the quantitative determination of autoantibodies to TPO (thyroid peroxidase) is used. TSH, Total T3, Total T4, and Serum ferritin test done by Immulite 2000 autoanalyzer. Serum iron, TIBC and UIBC by Diemension rxl autoanalyzer.

Results

Patients samples shows elevated TSH, low level of thyroid hormone and the presence of antibodies against thyroid peroxidase (TPO antibodies), these results in addition to physical examination indicates hashimoto’s thyroiditis. The estimated mean values results revealed that the hashimoto’s patients have elevated levels of anti-TPO (88.02 ±41.26 Au / ml), TSH (4.782 ± 7.093 uLU/ml),TIBC(391.08 ± 144.14 ug / dl), UIBC(362.16 ± 131.27 ug / dl) and TSAT(34.179 ± 160.83) as compared with controls. Anti-TPO (P = 0.009), TSH(P = 0.001), TIBC (P = 0.010) and TSAT (P = 0.002) were significantly higher than that of controls: (18.175 ± 7.249 Au / ml), (1.974 ± 0.9997uLU / ml), (307.225 ± 54.836ug / dl) and (16.082 ± 3.718) respectively. While TIBC (P = 0.250) is not significantly higher than that of controls: (365.05 ± 56.537 ug / dl). In other hand, the estimated mean values results revealed that the hashimoto’s patients have lowered levels of Total T3(1.5306 ±0.4649 nmol ⁄ L), Total T4 (58.7816 ± 6.4303 nmol ⁄ L), Ferritin (19.8967 ± 11.6948 ng / ml) and Iron (45.571 ± 61.869 ug / dl) as compared with controls. Total T4 (P < 0.0001), Ferritin (P = 0.003) and Iron (P < 0.001) were significantly lower than that of control: (98.960 ± 21.801 nmol / L), (84.7755 ± 205.139 ng / ml) and (57.825 ± 12.3369 ug / dl) respectively . Total T3 (P = 0.058), is not significantly lower than that of controls: (1.7048 ± 0.3908 nmol / L) .

The descriptive statistics studies of both hashimotos patients and controls for thyroid profile and iron profile is shown in table (1).

Data were also subjected to Receiver Operation Characteristic curve (ROC curve) to evaluate the validation of different parameters for the detection hashimoto’s thyroiditis in Iraqi patients.
ROC curves studies confirmed the validity of Anti-TPO to detect Hashimoto’s thyroiditis in Iraqi patients. ROC curves for TSH, Total T4, Total T3 in addition to Anti-TPO are shown in Figure1. Area under the curve, standard error and 95% confidence intervals were calculated for the variable as in table 2.

**Discussion**

The current study shows low ferritin levels in patients with hashimoto’s thyroiditis (HT). Hashimoto’s thyroiditis (HT), is a chronic autoimmune thyroiditis\(^{17}\), that cause thyroid enlargement and acquired hypothyroidism\(^{18}\). antibodies to thyroperoxidase and or thyroglobulin are considered the most sensitive and specific biomarkers to establish HT disease\(^{19}\), in current study the hashimoto’s patients have highly significant elevated levels of anti-TPO when compared with controls \((**P < 0.0001)\), results of ROC curve confirmed the validation of anti-TPO as exceptional biomarker for detection of HT. Hashimoto’s is not usually discovered until it has progressed to the advanced stages, where there is a significant damage of thyroid gland. Genetic predisposition in the initial stage\(^{20}\) (stage 1), with
normal TSH, T4/T3 hormones, no thyroid antibodies and no changes in thyroid gland. Stage 2 is characterized by an overabundance of lymphocytes in the thyroid gland, that attack healthy thyroid tissues\(^{(21)}\). Subclinical hypothyroidism is shown on stage 3 of HT, at this stage, the TSH may be slightly elevated on blood tests and the levels of free T3 and free T4 are going to be normal\(^{(22)}\). Stage 4 with overt hypothyroidism, started to have thyroid gland failure, thyroid gland will be destroyed and unable to produce its own hormone, this is the most common stage when it diagnosed. The results of current study is related to stage 4 as there is a significant increase of TSH for hashimoto’s patients if compared with controls \((**P = 0.009)\), in addition total T4 is with highly significant decrease for hashimoto’s patients if compared with controls \((*P < 0.0001)\), total T3 also decrease in hashimo’s patients if compared with controls \((P = 0.058)\), but it is not significant. The last stage (stage5) may be progressed for another autoimmune condition\(^{(23)}\). Ferritin is released to the blood stream in a controlled manner, it is essential for the regulation of iron homeostasis\(^{(25)}\). Ferritin is found in most tissues as a cytosolic protein, its function is cell detoxification by limiting the formation of reactive oxygen species, and modifying their damaging effect on cellular structures, with optimal levels > 50 ng/ml. In current study, highly significant decreased levels of ferritin for HT patients if compared with controls \((**P = 0.003)\). Also serum iron shows a highly significant decreased levels for HT patients if compared with controls \((**P < 0.0001)\). TIBC shows nonsignificant increased levels for HT patients if compared with controls \((P = 0.25)\). UIBC shows a significant increased levels for HT patients if compared with controls\((*P = 0.01)\), TSAT with a highly significant increased levels for HT patients than that of controls \((**P = 0.002)\). The estimated high levels of TSH for hashimoto’s patients may induce inflammatory cytokines and decrease the concentration of antioxidants in the body, and this increased level of TSH may be related to the significant decrease in ferritin levels in hashimoto’s patients if compared with controls, so the estimation of serum ferritin may help in understanding the etiopathogenesis, diagnosis, and monitoring of hashimoto’s patients\(^{(26)}\). Although there is non-significant decrease in the level of Total T3 in hashimoto’s patients if compared with controls \((P = 0.058)\), but still this decrease of Total T3 may affect ferritin level as some studies indicates that the expression of the gene for ferritin biosynthesis has been stated to be induced by T3 hormone\(^{(27)}\), and it was found that administration of T3 to hypothyroid individuals produce a significant increase in the serum ferritin level. Early detection of HT prevents the damage of the thyroid gland. First stage shows normal TSH,T4,T3 and no anti-TPO. The only reliable biomarker at the second stage of HT is the anti-TPO because of its appearance, patients does not require therapy unless the TSH level is elevated: the increase of TSH established at stage4 at which the serum iron and total T4 to be used as a reliable biomarkers, and as hashimo’s disease causes thyroid hormone deficiency, this leads to significant decrease of both ferritin and iron, that may cause the depletion of iron stores of the body if blood ferritin below 12 to 30 ng /ml. Finally: HT decrease the level of ferritin but the validity of it to be used as a biomarker is less than that of serum iron. The validity of anti-TPO, total T4 in addition to serum iron to be employed as a reliable biomarkers for the detection of HT according to the AUC of ROC analysis.

**Conclusion**

The need to new selective treatment for HT, Like the stem cells which may be used for the treatment of HT by tissue replacement for the destroyed thyroid. In addition genetic studies with checking immune cell modifications to inhibit the binding of anti-TPO with thyroperoxidase enzyme. The tumor necrosis factor alpha (TNFα) together with other mediators (cytokines), play a fundamental role in the pathogenesis of HT, therefore the use of biological drugs like anti-TNFα that targeting of one of TNFα receptors leading to the reduction of tissue and organ damage caused by inflammatory responses.

Abstract

This study aims to analyze the level of household food security and food insecurity in Donggala Regency. Type of research was quantitative with a cross sectional approach carried out in Donggala Regency. Two districts that were selected to represent the situation of food security based on the consideration of the results of the FIA (Food Insecurity Atlas), namely Tanantovea (food insecure areas), and Balaesang (food resistant areas). The household sample of 100 households was selected purposively. Research variables are the characteristics of respondents (age, sex, education, occupation), income and expenditure of food, food security indicators, food security programs and poverty alleviation, food insecurity status at the household and regional level. Data analysis was descriptive and chi-square test with a significance level of p < 0.05. The results of the study are the age characteristics of respondents, namely age 35-44 years at 29.0% and ≥ 55 years at 25.0% and the main occupation was as a farmer / breeder at 57.0%. The average per capita income of respondents was Rp 818,000 in the food insecurity group and Rp 2,227,000 in the food security group. Food expenditure was higher in the food insecurity group, which was an average of Rp. 374,660 compared to non-food family expenses, which was an average of Rp. 172,426. Most of the food insecure families are in areas that are classified as food insecurity, which was 72.0%, while households that are considered food resistant are generally in food security areas, which was 90.0%. The conclusion is that household food insecurity was significantly related to the area’s food security status. For regions with food insecurity status, households generally experience food insecurity.

Keywords: Food insecurity, Food security, Income and expenditure of food, Food security programs.

Introduction

In general, the main problem faced in the food availability system in Indonesia is the rate of the increase in national food production (supply) has not been able to catch up with the rate of increase in population food needs ¹. The problem in the food distribution system is the limited transportation facilities and infrastructure that can reach all regions, especially remote areas and there are still many official and unofficial levies so that food prices at the household level do not provide true prices ².

The impact of all these problems ultimately leads to the increasingly weak ability of households (especially poor farmers) to be able to access food sufficiently and affordably.

On the consumption side, there is a fact that shows the high population of food insecurity and hunger. Data on hunger level or Global Hungry Index (GHI) in Indonesia shows very alarming figures. At present, Indonesia’s GHI is 21.9%, meaning that Indonesia is in a critical condition in the problem of food equality. If the high cases of food insecurity and hunger in Indonesia are not immediately dealt with seriously, this will cause problems that are also serious for the quality of human resources in the future. Children under five who experience food insecurity and starvation to experience malnutrition cause their IQ is 13.7 points lower than normal children³.

In Central Sulawesi, there are 7 regions that are included as food insecure areas and Donggala District is included in the order of 113 food insecure areas in Indonesia. One source of household income in rural areas is farming in general, especially rice farming. This study aims to analyse the level of household food security and food insecurity in Donggala District and its implications for food security policies in the area.

Materials and Method

This is a quantitative study with a cross sectional design. The study was conducted in Donggala District, and two sub-districts that were representative of the food security situation were selected based on consideration of the results of the FIA (Food Insecurity Atlas). These sub-districts are Tanantovea (food insecure area), and Balaesang (food security area).

A total of 50 households were selected purposively from each selected village. Purposive sampling was carried out based on household involvement (8-10 households per type of program) in food security and poverty programs, including: 1). Food Self-Reliance Village Program (mapan), 2). Food Diversification Program, 3). Village Granary Program, 4) Strengthening Food Distribution, 5). Economic Improvement Program, 6). Other programs, 7). Non-recipient of the program.

Research variables are the characteristics of respondents (age, sex, education, occupation), food income and expenditure, food security indicators, food security programs and poverty alleviation, food insecurity status at the household and regional levels. Data analysis was descriptive and Che-square test with a significance level of p < 0.05.

Information
P1 = Concerned that staple food is available at home
P2 = Staple food supplies are few and don’t have money to buy
P3 = Cannot provide balanced nutritious food (four times) for children
P4 = Can not provide balanced nutritious food (four times) for children
P5 = Children are not getting enough food
P6 = Feeling very hungry and there is no food at home
P7 = There are family members besides children who eat less because there is not enough food
P8 = Reducing the portion of food for children because there is not enough food
P9 = There are family members other than children who do not eat all day because they do not have money
P10 = Some children don’t eat because they don’t have money
P11 = There are children who experience decrease in body balance due to lack of food or unable to buy food
P12 = There are adult family members who experience weight loss due to lack of food or being unable to buy food
n1 = Almost every day,
n2 = Almost every week,
n3 = Almost every month,
n4 = Several times a year,
n5 = Never

Table 3 shows that in general families belonging to the category of food security rarely experience indicators of food shortages such as fears of staple food supplies at home, staple food supplies are small and do not have money to buy, or cannot provide balanced nutritious food for children.

Table 4 shows that some respondents said that they had received assistance from the government in the form of BLT (Direct Cash Assistance) and RASKIN (rice for the poor). In food insecure areas, the majority (60.0%) of respondents said they had received Direct Cash Assistance (BLT). Whereas in the area of food security, the number is balanced between those receiving BLT and RASKIN. Most respondents said that the program obtained could help in meeting their daily food needs (Table 5).

Table 6 shows that food insecure households are mostly in areas that are included as food insecurity, which is 72.0%, while households that are classified as food security are generally in food security areas, which is 90.0%.

Discussion

The results showed that the majority of food insecure families were in food insecure areas as well, namely 72%. Food security is realized if the entire population has physical and economic access to food to meet nutritional adequacy according to their needs, so that they can live in healthy and productive lives day after day. Other results show that the dominant factor influencing the level of food security to food insecurity is the parameter of the population living below the poverty line. High household income affects spending on food, and food-insecure households account for most of the below-average food expenditure.

Respondents in this study indicate that the majority work as farmers. This finding shows that most households in rural areas are vulnerable to food due to the low income received. This situation is thought to be due to the relatively limited employment opportunities in rural areas compared to urban areas, so that rural households have limitations in terms of income sources.

Food insecurity that occurs at the study site is included in chronic food insecurity. Chronic food insecurity is a condition that occurs and takes place continuously which is usually caused by low purchasing power and low quality of resources and often occurs in isolated and arid regions. Household income is a predictor of chronic food security in low-income urban household. We hypothesized that adolescents in low income urban households are more likely to suffer from chronic food insecurity than those in the rural areas who may have direct access to agricultural products.

METHOD: This report is based on data from the first two rounds of the Jimma Longitudinal Family Survey of Youth (JLFSY). Food security for households is influenced by many factors such as land ownership (physical) supported by appropriate climate and human resources (HR). Agricultural policy also determines the actors of production or the market to provide sufficient food. Improvement of farmers’ income will ensure the fulfillment of quality food in accordance with the nutritional needs. Fulfillment of this food matter reflects the level of welfare of farmers will be better.

The results showed that some of the efforts made for families including food insecurity were assistance from the government in the form of BLT (Direct Cash Assistance) and RASKIN (rice for the poor). One study showed that giving cash directly to poor families aimed at food security. Other research shows that efforts to grow household food independence by increasing productive businesses that provide additional household income. Besides utilizing the optimal yard area to increase household food diversity. In addition, there is a policy regarding investment in the agricultural sector which aims to increase food production.
Conclusion

Food insecurity at the household level is significantly related to the food security status of the area. Generally, areas that are not food security, the household experiences food insecurity.

Violence among Mental Health Nurses in Indonesia Related to Working Alliance: A Quantitative Study

Iyus Yosep¹, Helmy Hazmi¹, Henny S. Mediany², Zabidah Putit³

¹Faculty of Medicine and Health Sciences University Malaysia Sarawak Malaysia, ²Faculty of Nursing Universitas Padjadjaran Bandung Indonesia, ³Faculty of Nursing & Pharmacy University of Nizwa Oman

Abstract

This study determined the relationship between Working Alliance and its association with Physical, Verbal, Psychological and Sexual Violence among Mental Health Nurses in Indonesian Mental Hospital. This study used a quantitative approach. A total of 120 nurses were selected in the Mental Hospital West Java Indonesia using purposive sampling. About two third of the respondent were female; 80% had an education background of bachelor and diploma. About 80% of the respondent has work experienced of more than 10 years and 60% of the nurses are currently working in acute and chronic room. Most of the nurses experiences low level of violence in all four categories (physical, verbal, Psychological and sexual) which range of 54.2% to 69.2%. Psychological violence recorded the highest percentage of violence (45.5) among all four type of violence. The percentage of Working Alliance is high about 51.1% among Mental Health Nurses. There is a significant relationship between violence and Working Alliance, wherein the higher the exposure to violence, the lower the working alliance.

Keyword: Exposure Mental Health Nurses to Violence, Working Alliance.

Introduction

Mental health nurses are confronted with their routine activities related to traumatic events and unpredictable work conditions such as paranoid, hallucination or aggressive behaviour. Several studies report a high prevalence of post-traumatic stress disorder (PTSD) in the nurses¹. The experience of violence has effect on the mental health nurse performance. This not only affects the individual nurse, but also has impact on the quality of care.

The study of violence and traumatic experiences in Indonesia provide critical information, allowing for proper interventions. The relevant data will enhance the hospital management to improve polices that promote an optimum work climate and provide appropriate interventions for mental health nurses and patients. It will allow the mental health nurses to give their patients the best intervention and, thus, minimize the rate of relapse in patients with mental illness in Indonesia. Furthermore, it may answer the phenomenon of “Lack of Nursing Job Motivation” in Indonesia.

The meaning of exposure to violence in this study is the tendency of mental health nurses to be exposed to violence at mental hospitals when they are faced with schizophrenic patients who behave aggressively. Violence is defined here as the “intentional use of physical force or power, threatened or actual, against oneself, another person or a group or community, which either results in or has a high likelihood to give rise to injury, death, psychological harm, mal-development or deprivation.” ²,³

The operational definition of violence accepted within the context of this study is: ‘displaying aggressive behaviour, including spitting, scratching, deploying physical force, or the use of an object as a weapon, either to threaten or assail physically⁴. The sub-variable in this research relates to a definition adapted from WHO (2003)⁵, namely to the nurse’s exposure to physical violence (assault/attack) & psychological
violence (emotional abuse) such as bullying/mobbing, harassment, sexual harassment, racial harassment and threat.

Working Alliance is an attitude, agreement, engagement and commitment that offer a meeting point between nurses and patients, where we may perceive violence from a different point of view\(^6\). This concept is an important part of the nurse’s role as a facilitator for patients to improve and growth. Evidence shows that work alliances are effective for reducing the high burden of psychiatric nurses, related to the patient’s full dependence on nurses\(^7\). A study conducted by Roche & Duffield (2010)\(^8\) revealed that compared to nurses in public hospitals, nurses in mental health hospitals had higher nurse-patient relationship scores. However, traumatic experiences such as patient violence against nurses adversely affect nurse performance. Previous research reports that nurses have difficulty communicating with people who threaten, behave aggressively and destructively\(^9\). Indeed, traumatic experiences and exposure to violence can have a negative impact on nurses and can even impede engagement with patients.

The topic of the subject area in this research is exposure to violence among the nurses in West Java’s Mental Hospital. The justification for research is the evidence of literature that indicates the presence of violence against nurses. It is supported by previous studies by Lee, Pai-Yen 2010; Spector, Zhou Che, 2014; Chang et al. 2015; Mcmenamin 2013\(^{10-13}\).

The purpose of this study was to explore empirical data on the exposure of mental health nurses to violence in Mental Hospitals, West Java, Indonesia, and on the commitment of nurses to the establishment of an alliance with psychiatric patients.

**Material and Method**

**Research Variables:** Independent variable in this study is the exposure of nurses to violence such as physical, psychological, emotional, sexual abuse committed by patients in mental hospitals. Meanwhile, the dependent variable is “working alliance”on nurses at Mental Hospitals in West Java.

**Study Design:** This study is correlational quantitative research method. Approach used is cross sectional where the data on variables are gathered in a certain period of time.

**Location:** Locations chosen to conduct this study is Mental Hospitals in West Java. The period of data collection was from the first week to the fourth week of May 2016. The hospitals were chosen as the research sites because they are the largest psychiatric hospitals in West Java and become the main referral hospitals in Indonesia.

**Sample and sampling:** The sampling technique used in this study is Purposive Sampling. Samples were mental health nurses having a minimum educational background of Diploma III and having worked for at least one year. Purposive sampling was applied to select 120 from all 215 mental health nurses with experiences of violence in relation to schizophrenic patients in this mental hospital.

**Instruments:** The traumatic experience, especially mental health nurse’s exposure to violence, was measured using Survey Questionnaire on Workplace Violence in the Health Sector, English version, from WHO (2003)\(^5\) which was translated and adapted into Indonesian. Before used, this instrument was subject to content test (content validity) by a mental health nursing expert (Head of Department of Mental Health Nursing Universitas Padjadjaran Indonesia). Thereafter, the instrument was tested against nurses at another mental hospital having characteristics similar to the mental hospital where the research took place. The test result of the instrument had its validity and reliability analysed statistically.

Working Alliance was measured using “Working Alliance Inventory-Short Revised (WAI-SR) for patients and “Working Alliance Inventory-Short Revised-Therapist (WAI-SRT) for nurses. Both instruments have been revised and retested for validity by Adam Horvath (2000)\(^{14}\).

**Data Collection:** Ethical approval from the ethics committee of mental hospitals in West Java was obtained before data collection. After that, the researcher asked for data about nurses who worked in the hospital under study, and told the head of the nurse at the hospital who met the requirements. An informed consent form was given to nurses before they received the questionnaire. Data collection in this study was conducted through a questionnaire containing items arranged based on variable indicators, distributed to respondents to get their responses to each item. It is important that the steps and method match the research question. The method in this study included filling out a questionnaire about
experience exposed to violence and commitment to the alliance. This instrument takes about 15 to 20 minutes to complete. After completing all questionnaires, respondents must return the questionnaire, and the researchers re-examine the completeness of the surveys.

**Data Analysis:** The data recorded and analysed using SPSS 20. Descriptive analysis and inferential statistics are carried out if necessary. The standard deviation of the mean (SD) was added for continuous data, while frequency and percentage were used for categorical variables. Univariate and multivariate analyses were done to determine the relationship between the nurses’ experiences of violence and Working Alliance. The confidence interval of 95% was used. The p-value of less than 0.05 was considered as significant. The alternate choices in the instrument were made using Likert scales, namely: more than 4 times a day, 1-3 times a day, 2-6 times a week, once a week, never.

**Findings**

**Socio-demographic Characteristics:** The socio-demographic characteristics discussed in the present research were based on age, gender, educational level, duration of work, and the longest workplace.

| Table 1: Socio-demographic characteristics of Mental Health Nurses in West Java (n = 120) |
|-----------------|-----------------|-----------------|
| Socio-demographic | Frequency (N) | Percentage (%) |
| **Gender**       |                |                 |

| Chronic Room     | 39             | 32.5            |
| Emergency Room   | 18             | 15.0            |
| Drug Addiction & Rehabilitation Unit | 9 | 7.5 |
| Administration   | 13             | 10.8            |

**Exposure to Violence among Mental Health Nurses:** Exposure-to-violence was divided into four sub-variables: physical, verbal, psychological, and sexual violence. Most of the respondents reported their experience of physical, verbal, and psychological violence. Some of claimed that they suffered violence of high intensity and others of low intensity. There are nearly half of the respondents experienced a high exposure in all violence types. On the contrary, a majority of them (69.2%) had ever experienced a low intensity sexual violence. For more details, see table 2 below.

| Table 2: Characteristic of Physical, Verbal, Psychological and Sexual among Mental Health Nurses (n = 120) |
|-----------------|-----------------|-----------------|
| Types of violence | Frequency (N) | Percentage (%) |
| Physical        |                |                 |
| Low             | 72             | 60.0            |
| High            | 48             | 40.0            |
| Verbal          |                |                 |
| Low             | 70             | 58.3            |
| High            | 50             | 41.7            |
| Psychological   |                |                 |
| Low             | 65             | 54.2            |
| High            | 55             | 45.8            |
| Sexual          |                |                 |
| Low             | 83             | 69.2            |
| High            | 37             | 30.8            |

**Working Alliance among Mental Health Nurses:** Out of the 120 respondents, 65 (54.2%) of the respondents showed low working alliance. Meanwhile, 55 (45.8%) of the respondents showed a high working alliance.

**Relationship between Socio-Demographic Characteristics and Working Alliance:** The research findings revealed that there was a significant relationship between educational level and working alliance by a P value of < 0.001. That is, the higher the educational level, the higher the mental health nurses’ capacity of working alliance.

**Relationship between Working Alliance and Exposure to Violence:** Table 3 shows the results of cross tabulations of various types of violence and work alliances. This study found that respondents with high physical violence had a low chance of work alliance or cooperation of 7.667 times than respondents who had suffered from low physical violence. Then, those who
had high exposure to verbal violence had a chance to have a low work alliance of 7.156 times than respondents with low exposure to verbal violence. While respondents with high exposure to psychological violence had the opportunity to have a low work alliance (cooperation) of 6.04 times than respondents with low psychological violence. Respondents who were experienced with exposure to high sexual violence had the opportunity to have a low work alliance of 2.692 times than respondents with low sexual violence.

### Discussion

**The Occurrence of Violence in Nurses:** In this study, the rate of violence, quantitatively, in Mental Hospital, West Java, particularly in “high exposure” category, was represented by the type of psychological violence. The psychological violence account for nearly half (45.8%) of total violence, while “low exposure” in sexual assault is 30.8%. On the other hand, the results of quantitative data collection showed that high exposure to physical violence is 40.0%, high exposure to verbal violence is 41.7%, and more than half (69%) of nurses at the Mental Hospital had encountered sexual violence, despite of “low exposure” category.

Some studies found real violence in nurses at the Mental Hospital. This is consistent with earlier studies; “Violence is, actually, a fact of working life for nurses”. Similarly, Roche et al. (2010b) studies on psychiatric nurses concluded that “perceptions of violence affect job satisfaction”, while Lützén et al. (2010) reported that those nurses working in a mental health environment deal with “moral burden”. This is confirmed by other researches concluding that more than a half of mental health nurses in Taiwan were reported had have physical violence and verbal abuse. In general, the physical violence at the Mental Hospital in West Java, Indonesia, is higher than earlier findings. However, the presence of violence signals an “alarm” that violence in nurses need for special attention in many countries. Essentially, the world must give a “priority” to handling violence in those nurses.

**The relationship between exposure to violence and Alliance:** There is relationship between exposure to violence and Working Alliance. The higher the exposure to violence, the lower the Alliance will be. The lower the exposure to violence, the higher Working Alliance will be. It is explicable that human beings will, naturally, avoid anything that threatens or hurts them. Exposure to violence by patients lead nurses to regard patients as stressors, thereby making functions of nurses as correcting emotional patients and facilitating patients to adapt to stressors ineffective. Reduce risks of or impacts of exposure to violence can improve effective relationship of nurses and patients to achieve the goals. Nurses can do their tasks properly under secure conditions and a good environment.

**Limitation of Study:** The limitation of this study should be acknowledged. The samples which have taken from the patients and from the nurses are still limited. Ideally to generalize the conclusions of national quantitative research should be representative, it could be taken from all region of Mental Hospitals in all province of Indonesia.

### Conclusion

Violence among mental health nurses in mental hospitals, particularly in West Java, Indonesia, is an area of concern to be addressed. The types of exposure to violence found in the hospitals include physical, psychological, verbal, and sexual abuse. Exposure to violence occurs on a low to high scale. The highest type
of exposure to violence is psychological violence, while the lowest is sexual violence. Generally, it can be said that the higher the nurse’s exposure to violence, the lower the desire to build a working alliance.

The suggestions from this study are:(1) security and safety consideration. The director of a mental health hospital needs to develop a protection and insurance program for nurses in dealing with physical, psychological, verbal and sexual violence. The importance of developing electronic systems to facilitate nurses when asking for assistance from security team, if needed, or when patients are noisy, anxious, uncontrolled and disturbing, aggressive, threatening their lives and environment.(2) Education and Training Department. It is also very important to design work alliance training and therapeutic strategies for nurses, especially in unexpected situations.(3) management aspects and (4) unit of treatment after trauma, in which all components are very important as fundamental aspects to promote the Working Alliance program at Mental Hospitals.

Enhanced Fibrin-Lysis in Grade-1 Dengue Haemorrhagic Fever

L. Mutiara¹², Stephen C.L. Koh², Adang Bachtia³, Herman Hariman²

¹Division of Tropical Medicine, Murni Teguh Memorial Hospital, Faculty of Medicine, University of north Sumatera, Medan Indonesia, ²Department of Clinical Pathology, Faculty of Medicine, University of North Sumatera/Hajj Adam Malik Hospital, Medan Indonesia, ³Department of Public Health Program, Cipto Mangunkusuma Hospital, University of Indonesia, Jakarta, Indonesia

Abstract

Background: Dengue fever has become a major international health concern affecting especially tropical and sub-tropical regions worldwide. The pathophysiology of dengue haemorrhagic fever is complex which involve endothelial activation and plasma leakage.

The objective of the study was to determine endothelial activation and plasma leakage effects on fibrin-lysis in Grade-1 dengue haemorrhagic fever.

Method: Twenty-two patients (Males n = 14, females N = 8) with Grade-1 DHF who fulfilled the WHO protocol for dengue were recruited. Their mean age was 22.5 ±12.2 years and ranged between 4 years and 54 years old. Blood sampling was performed at febrile, defervescence and convalescence phases for the determination of fibrinogen, Von Willebrand Factor (VWF), vascular endothelial growth factor (VEGF), prothrombin fragment 1+2 (F+2) and D-dimer levels. Fifteen normal subjects were recruited to serve as normal controls.

Results and Discussion: There were no statistical differences observed between defervescence and convalescence phases compared with febrile phase for F1+2, D-dimer, VEGF, VWF and fibrinogen. At febrile phase elevated VEGF and VWF levels suggest endothelial activation and plasma leakage triggering the activation of coagulation and thrombin generation evident by increased F1+2 levels and fibrinolysis by marked fibrin lysis split product D-dimer. The levels remain elevated even at defervescence and convalescence phases. Fibrinogen levels showed a mean decline trend but remained within normal range.

Conclusion: In Grade-1 dengue hemorrhagic fever the activated vascular endothelium evident by plasma leakage triggers the activation of coagulation creating a hypercoagulable and fibrinolysis state with enhanced fibrin-lysis still persist in the convalescence phase.

Keywords: Endothelial and coagulation activation, DHF.

Introduction

Dengue fever has become a major international health concern affecting especially tropical and sub-tropical regions worldwide. The serious consequence of mosquito-borne dengue infection is well-known. Dengue is caused by a virus of the Flaviridae family and caused by four distinct and closely related virus (DEN-1, DEN-2, DEN-3 and DEN-4). Recovery from infection by one specie only provides immunity from that particular serotype¹. The actual numbers of dengue are underreported as majority of cases are asymptomatic. One study estimated that 3.9 billion people in 128 countries are at risk of dengue infection². In Indonesia, the overall incidence increased significantly from 0.05/100,000 in 1968 to 35-40/100,000 in 2013³. There is no specific treatment for dengue fever but maintaining patients’ body fluids is critical. WHO⁴ defined dengue with and
without warning signs of plasma leakage and classified into four grades (Grades 1 to 4). The pathophysiology of dengue haemorrhagic fever (DHF) in human is complex and the clinical symptoms due mainly to immune response also involve endothelial cell activation leading to plasma leakage and triggering the activation of the haemostatic system. The endothelium plays an important regulatory role in the circulation as physical barrier involved in the control of thrombosis and thrombolysis, vascular tone and growth of blood vessels and play a critical role in a variety of human disorders. Endothelial activation may be responsible for plasma leakage and shock and is associated with elevated Von Willebrand Factor (VWF) and vascular endothelial growth factor (VEGF) a known potent regulator of vascular permeability and angiogenesis. D-dimer, the lysis product of cross-linked fibrin indicates hyperfibrinolysis in response to clotting activation and fibrin formation. It is also a marker for hypercoagulability and links with venous as well as arterial thrombotic events and used to determine thrombosis in myeloproliferative disease. It can be used as stand-alone test to exclude deep vein thrombosis. Fibrinogen is involved in both primary and secondary haemostasis playing an important role in platelet aggregation and establishing a fibrin network. It is an acute phase reactant protein converted into insoluble fibrin by thrombin during coagulation has been extensively reviewed. The conversion of prothrombin to thrombin is a key event in blood coagulation. Prothrombin fragment 1+2 (F1+2) is an activation peptide released from prothrombin during thrombin generation. Prothrombin fragment 1+2 directly reflects thrombin generation and elevated levels reflect a high risk of thrombosis. Increased activation of coagulation (F1+2) was reported in critical severe dengue infection in Indonesia and is associated with plasma leakage and thrombocytopenia. In the Brazilian study it was reported that elevated D-dimer and thrombocytopenia with reduced thrombin generation and excessive fibrinolysis are associated with bleeding complications.

The objective of the study was to determine endothelial activation and plasma leakage effects on fibrin-lysis in Grade-1 dengue haemorrhagic fever.

Materials and Method

The study received ethical approval from the Health Research Ethical Committee No 418/TGL/KEPK FK USU-HAM/2018, Faculty of Medicine, University of North Sumatera, Indonesia. The study was conducted at the Murni Teguh Memorial Hospital, Medan Indonesia.

Subjects. The patients admitted to the hospital with fever were recruited and diagnosed according to WHO protocol. Fifty DHF patients were recruited into the study. However, plasma fibrinogen was added to the study later but only thirty patients had remaining aliquots stored and we therefore decided to investigate twenty-two patients with Grade-1 DHF (males 14, females 8) with fibrinogen performed in association with VWF, VEGF, D-dimer and F1+2 levels. The mean age of the patients was 22.5 ±12.0 years and ranged between 4 years and 54 years old. The Inclusion criteria: patients who met WHO criteria for dengue fever and willing to take part in the study and had one or more dengue serology positive for either IgM/IgG antibodies or NS1antigen, Exclusion criteria: patients with other infections and systemic diseases and not willing to take part in the study.

Normal Controls. Fifteen normal subjects (males n = 14, female n = 1) who are normotensive, had not taken any medication recently and no history of health issues was recruited to serve as normal controls for the DHF study. Their mean age was 22.9 ± 1.1 years and ranged between 18 years and 33 years old.

Blood Sampling and Laboratory Investigation. From a clean venepuncture 3 mL EDTA blood was used for routine haematological investigation including serological tests for IgG/IgM antibodies and NS1 antigen (SD Bioscience, Ingbert, Germany). 10 mL of citrated blood was spun in the refrigerated centrifuge at 2500g for10 minutes and the plasma aliquoted and stored at -80°C. Citrated-plasma was used for Elisa analysis of prothrombin fragment 1+2 (F1+2), Von Willebrand Factor (VWF), vascular endothelial growth factor (VEGF) (USCN Life Sciences, Wuhan, China) and D-dimer (Vidas D-dimer Exclusion II, Biomerieux SA France), fibrinogen (Clauss).

Statistical Analysis. The Statistical Package for Social Sciences (SPSS 22 IBM Corp) was used to perform statistical analysis. The independent t-test for differences between groups at different DHF phases were performed together with one-way Analysis of Variance (ANOVA) and Pearson’s correlation. A P value of < 0.05 was considered statistically significant.
Results

Normal controls. Plasma F1+2 were not detectable (sensitivity < 28.1 pg/mL), VWF was mean 1.9 ± 1.4 ng/mL in 13.3% normal controls and non-detectable in 86.7% (sensitivity < 0.94 ng/mL), VEGF was mean 71.7 ± 27.9 pg/mL, D-dimer normal range was less than 500 ng/mL and fibrinogen between 2.0 and 4.0 g/L.

Comparison of parameters (mean (SD) studied in Grade-1 dengue haemorrhagic fever at febrile, defervescence and convalescence phases and compared with febrile phase.

There were no statistical differences observed between defervescence and convalescence phases compared with febrile phase for F1+2, D-dimer, VEGF, VWF except for fibrinogen which showed a downward trend at defervescence (P = 0.07) and at convalescence phase (P = 0.25) even though the mean levels were within normal range. The other parameters studied showed elevated mean levels from normal despite no significant differences between the various phases. At febrile phase elevated VEGF (mean 230.2 ± 150.5 pg/mL) and VWF (mean 122.5 ± 28.3 ng/mL) suggests endothelial activation and plasma leakage triggering the activation of coagulation and thrombin generation evident by elevated F1+2 levels (mean 345.7 ± 137.5 pg/mL) and fibrinolysis by marked fibrin lysis split product D-dimer (mean 1677.2 ± 871.5 ng/mL). The levels remain elevated at defervescence and convalescence phases, D-dimer showed a declining trend at convalescence to mean 1282.8 ± 891.2 ng/mL (P = 0.17) but it did not reach statistical significance and remain elevated. Fibrinogen were within normal range (mean 2.80 ± 0.71 g/L) at febrile phase but showed a declining trend at defervescence (mean 2.41 ± 0.66 g/L) (P = 0.07) and convalescence (mean 2.49 ± 0.97 g/L) (P = 0.25) contributing to coagulation and fibrin formation (Table 1).

The mean distribution of VWF, VEGF, F1+2, D-dimer and fibrinogen levels at febrile, defervescence and convalescence phases in Grade-1 DHF are shown in Figure 1.

Analysis of Variation (ANOVA). One-way ANOVA for VWF (P = 0.61), VEGF (P = 0.31), F1+2 (P = 0.41), D-dimer (P = 0.20) and fibrinogen (P = 0.24) did not show any significant variations between the three phases studied. This could also be in part due to the wide variations observed.

Pearson’s correlation. No significant correlation between the parameters studied except for VEGF and fibrinogen (r = 0.278, P = 0.02).

Table 1. Comparison of parameters (mean and SD) studied in Grade-1 dengue haemorrhagic fever at febrile, defervescence and convalescence phases and compared with febrile phase.

Discussion

The serious consequence of mosquito-borne dengue infection has become a major international health concern is well-known worldwide. The pathophysiology of dengue haemorrhagic fever in human is complex and the clinical symptoms of immune response also involve endothelial cell activation leading to plasma leakage and triggering the activation of the haemostatic system. It may also be responsible for dengue shock syndrome (6). Bleeding manifestation and plasma leakage are complications seen in dengue fever and bleeding in adults may occur in the absence of plasma leakage (7).

In our study of Grade-1 DHF endothelial activation at febrile, defervescence and convalescence was evident by the elevation of VWF and VEGF levels and increased F1+2 levels indicating activation of coagulation and thrombin generation with fibrinolysis evident by elevated D-dimer split products from enhanced fibrinolysis. Plasma fibrinogen levels were observed to decrease at defervescence ($P = 0.07$) and at convalescence ($P = 0.25$) despite it being within the normal range. It is the substrate for coagulation and conversion to fibrin and fibrin-lysis. No mortality was recorded in this study. Activation of coagulation was reported earlier in critical Indonesian DHF patients (8) and contrary to this, Orsi
and co-workers\textsuperscript{20} reported reduced thrombin generation and enhanced fibrinolysis contributing to bleeding episodes in Brazilian patients. Dengue virus binding directly to prothrombin inhibiting the conversion to thrombin could reduce thrombin generation had been suggested\textsuperscript{22}. However, the association between dengue and activation of coagulation remains controversial\textsuperscript{23}. Demographic differences and genetic make-up may contribute to these differences. Activation of coagulation and elevated D-dimer levels suggests hypercoagulability and enhanced fibrinolysis. Endothelial activation evident by elevated VWF and VEGF suggest plasma leakage triggering the activation of the coagulation system, thrombin generation evident by prothrombin fragment 1+2 and fibrinogen creating a hypercoagulable and fibrinolytic state with marked fibrin-lysis evident by D-dimer in Grade-1 DHF. Patients are discharged when they are afebrile and in good clinical condition during the convalescence phase but our study showed the endothelium is still in an ‘activation state’ and that further investigations need to determine when the endothelium reverts to normal function. At present there is no specific treatment for DHF but identifying the mechanisms affecting DHF would improve diagnosis and management therapy limiting morbidity and mortality.

**Conclusion**

In Grade-1 dengue hemorrhagic fever, activated vascular endothelium evident by elevated VWF and VEGF and plasma leakage triggering the activation of coagulation creating a hypercoagulable and fibrinolytic state with enhanced fibrin-lysis.

Developing Sbar Effective Communication Instrument in Emergency Handover at Emergency Department of Hajj Hospital in Surabaya

M. Hendri Haryono¹, Nursalam Nursalam², Muhammad Hasinudin³

¹Magister Student, Faculty of Nursing, Universitas Airlangga, Surabaya, ²Professor, Faculty of Nursing, Universitas Airlangga, Surabaya, ³Lecturer, Institute of Health Science, Ngudia Husada, Bangkalan, Indonesia

Abstract

Introduction: The implementation of SBAR in an emergency handover must be in accordance with the standard. Evaluation of 150 present status documents in medical record documents shows that the indicators of present status instruments in the emergency room of the Hajj Hospital have not been in accordance with the Standar Akreditasi Nasional Rumah Sakit (SNARS) and have not been well documented. The aim of this study was to develop the SBAR instrument in emergency handover.

Method: The research design used research and development carried out in 2 stages. The sample stage 1 is 150 DRM, stage 2 is 28 respondents and the FGD activities are 15 respondents used purposive sampling. Data analysis used descriptive analysis, pearson correlation product moment to test the validity and crobach alpha for reliability test.

Results: The SBAR instrument in emergency handover based on the standard, FGD activities were declared valid and reliable, the results of the socialization of training on incremental filling (100%) of nurses had good ability and the instrument was good stated by all nurses (100%). The application of SBAR instruments in emergency handovers in the emergency room of Surabaya Hajj Hospital showed that all respondents had good ability for the SBAR instrument documentation and all respondents thought that the SBAR instrument was in a good category.

Discussion and conclusion: The SBAR instrument in handover emergency was recommended for the emergency room at Haji Hospital, Surabaya.

Keywords: Effective communication, SBAR, emergency handover.

Introduction

Communication is the most important thing in a nursing care service, the basic principle of a patient service and is a critical component of safety quality management in health services. Effective communication among health professionals is the key to ensuring quality care in clinical practice. One form of ensuring quality care in clinical practice is the existence of a handover that has been defined as a transfer of clinical responsibility, has received increased international attention. Clinical handovers have been defined as international assignments and / or accountability for the care of patients from one provider or another provider team and nursing handovers¹.

Communication in the health field is different from communication with other professions, the communication competence between the medical and the patient has a very important role in determining the success of helping to solve the patient’s health problems. King Cit. Varcarolis² describes the therapeutic relationship as a learning experience for both clients and nurses, in which it can identify four actions that must be...
taken between nurses and clients is action initiated by the nurse, client reaction response, interaction where nurses and clients examine client needs and goals, transactions where reciprocal relationships are ultimately built to achieve the relationship goals. The conditions faced by clients are determinants of the role of nurses in clients.

Communication that occurs in the health sector is often ineffective, limited to sending or receiving calls and leaving messages between health workers and as a result many messages are not delivered optimally. The relationship of collaborative and communicative work between officers is the key to the success of patient-focused services. Communication between health workers (Handover) is communication that is carried out accurately, completely, understood, not duplicated and appropriate to the recipient of information to reduce errors and improve patient safety. The patient’s handover process is a complex interaction between medical personnel who will directly affect patient care. The effectiveness and completeness of this handover process will bring continuity to further patient care.

In implementing the form handover emergency between the emergency room and the room, there were many obstacles. In addition to carrying out their main tasks and functions, nurses were also faced with the overwhelming task of doctors, administrative tasks, data entry, handling patient complaints and other documentation tasks. Failure to communicate is one of the root problems that most often causes incidents of patient safety. With the existence of values and beliefs related to optimal communication problems, each nurse will know what should be done in applying the quality of nursing services. Thus, these behaviors eventually become a culture that is embedded in each nurse in the form of a patient safety culture states that the importance of good communication in handovers can be reflected in the work culture an organization, and currently the trending topic is about the culture of patient safety when handover / handover between nurse shifts. The aim of research is compiled the development of the SBAR effective communication instrument in emergency handovers on the accuracy of identification of emergency patients in Haji Hospital, Surabaya.

Material and Method

This research used Research and Development carried out in 2 stages. Phase 1 samples are 150 DRM, stage 2 is 28 respondents and FGD activities are 15 respondents using purposive sampling. Analysis of data used descriptive analysis, Pearson correlation product moment to test the validity and crobach alpha for reliability test. Phase 1 consists of evaluation, and FGD followed by stage 2 consists of socialization and trial of SBAR instruments.

Ethical Consideration: The participants were recruited on the basis of the Ethical Approval of Faculty of Nursing, Airlangga University with the number 073/16/KOM.ETIK/2019.

Result

The results showed that: 1) the form of effective communication (current status) on the delivery of ED patients to hospitalization was a lot of duplication of documentation, SBAR had not been published and had not met the National Standards for Hospital Accreditation (SNARS).; 2) development of SBAR’s effective communication instruments at the time of handover of power through FGD activities and expert discussions. In the FGD activities most respondents received 46-55 years, had undergraduate nursing education, sex of women, with 21-30 years of work experience and employment status as civil servants; 3) the results of the validity test with the average r count on the situation item instrument (0.766), background (0.615), assessment (0.691), recommendation (0.708) based on the overall value > r table (0.482) then validity and reliability testing with the average r count on the instrument averages above 0.6 so it is stated to be reliable: 4) socialization and trials of filling the SBAR effective communication instruments on the emergency handover are well implemented; 5) all nurses (100%) have good abilities; 6) discussion of the development of SBAR effective communication at the time of emergency submission by compiling guidelines for effective SBAR communication instruments at the time of emergency submission, training was held supported to improve the quality and knowledge of ED nurses and managerial staff who were very accepting of these instruments and could be used at ED Surabaya Hajj to improve the quality of nursing services.

Discussion

Emergency Handover used the new form, namely the SBAR instrument in the emergency room in accordance with the standards will be safer, and with a very good design it will be easier to apply according to existing clinical standards, the handover process can
also increase accountability and nurse’s responsibility\(^1\). This allows nurses in the emergency room of the Hajj Hospital to work more safely because they can fill SBAR’s instruments according to the standards, let alone the situation in the emergency room that is busy so that it requires effectiveness and speed so that patients can be saved from the emergency situation. The sense of security felt by nurses because they have carried out standardized documentation tasks will increase nurses’ self-confidence in carrying out nursing care to patients in the emergency so that patients get optimal care while in the emergency room of the Surabaya Hajj Hospital.

Effective communication among health professionals is the key to ensuring quality care in clinical practice. One form of ensuring quality care in clinical practice in the form of communication, clinical handover has been defined as the transfer of responsibility and accountability for patient care from one provider or another provider team\(^6\).

SBAR instruments in the emergency room have an important role in nursing service strategies. SBAR Document Writing has a problem oriented format, which is simple clear, logical and written in accordance with\(^7\), so it is very necessary for a complete SBAR document that can inform the patient’s condition up to recommendations for actions to be carried out according to the patient’s illness to improve service quality and patient safety.

Every doctor or dentist in carrying out medical practice must make medical records\(^8\). Medical records must be made immediately and completed after the patient receives service. Making medical records is carried out through recording and documenting the results of examinations, treatments, actions and other services that have been carried out to patients. Complete recording includes recording in the handover format on the ED. status evaluation is not optimal and not according to standard because the present status documentation does not describe the condition and development of patients in accordance with SNARS (2017), namely using the SBAR format.

The preparation of the development of SBAR’s effective communication instrument on Emergency Handover through FGD (Focus Group Discussion) was carried out after the researcher conducted an audit of the patient’s medical record. Most of the respondents who conducted FGD were educated in Nursing with a long work experience. The results of the study in Table 1 illustrate that nurses’ understanding of the importance of giving identity labels is still lacking, while\(^7\) requires that in 6 patient safety goals in patient safety, the first point is the accuracy of patient identity. Emergency Room conditions with a full number of patients on each shift and the patient’s emergency caused nurses to not prioritize documentation in their present status especially the patient’s identity, nurses only included their names and ages without completing other data. This causes the completeness of the documentation of the present status status of the instrument not optimal or incomplete.

The second result of the FGD illustrates that effective communication instruments in present status are not yet in line with the standards and there are no clear filling guidelines available\(^10\) in their study stated that handoff of patients in the emergency room was very easy to implement even though initially it was very difficult because of the large workload of nurses when taking action in the emergency room. However, considering the importance of handovers with SBAR when changing the shift to shift will minimize the number of unexpected events, the SBAR instrument becomes an important thing to do. ER nurses with high work rhythms have difficulty in documenting present status, it is possible because there are no clear SOP and filling instructions that are easily accessible to nurses in the emergency room and inpatient nurses.

The expert discussion was carried out to obtain input from the results of field studies, FGDs, and research journal studies and implemented into SBAR’s effective communication instruments in emergency handovers. Experts convey input on item situations to add nursing diagnoses that appear to patients. Situation contains about the patient’s identity and the main problems of nursing and medical including the nursing diagnoses that appear. The researcher added several choices of nursing diagnoses in accordance with the SDKI (Standard of Indonesian Nursing Diagnosis) by considering the choice of nursing diagnoses of the 5 largest cases that often occur in emergency patients in Surabaya Hajj Hospital. The researcher considered the time needed by the nurse in carrying out a brief assessment including in formulating the nursing diagnosis that emerged so that the intervention could be immediately made according to the patient’s condition.

Experts also provide input on the Recommendation form to add about nursing interventions according to
SIKI (Indonesian Nursing Intervention Standard) in accordance with the chosen nursing diagnosis. Researchers describe to recommend nursing interventions that have been and need to be continued for intervention, including discharge planning and education of patients and families.

The results of the study in table 3, namely all respondents argue that the quality of the instrument according to the user overview when tested shows that the quality of the instrument is good, judging from the aspects of Functionality, Efficiency, Usability. Evaluation has clear objectives according to the objectives set out in the program. Evaluation of the dissemination and trial of the practice of filling the SBAR instrument in the emergency room and the room on the Emergency Handover based on nurses’ opinions can be concluded that the SBAR instrument developed by researchers can be easily carried out by nurses and efficiently carried out related to the condition of the emergency department that describes the work conditions of nurses who must work fast in serving the emergency in patients who need a fast response time.

Effective SBAR communication was developed through socialization and testing of filling evaluation instruments for effective SBAR communication on emergency handovers in the emergency room in Surabaya Hajj Hospital. Participants were very enthusiastic about the socialization material presented and some nurses said that the previous present status was not fully documented because there was no filling guide available. The findings of the researcher show that the delivery of patients in the ER at first did not follow the SBAR standard guidelines.

**Conclusion**

Effective communication of the present status of emergency handovers in the emergency room of the Surabaya Hajj Hospital is equipped and developed into SBAR instruments (Situation, Background, Assessment, and Recommendation). Situation Points have a choice of nursing diagnoses based on SDKI (Standard of Indonesian Nursing Diagnosis). Nursing interventions developed in the SBAR instrument in the Recommendation point are prepared based on SIKI (Indonesian Nursing Intervention Standards).

Effect of Time Management Training Program on Nursing Mangers’ Performance

Marwa Kamal Mohamed¹, Fatma Ahmed Abed², Eglal A. Abd Elwahab³

¹Assistant Lecturer, Nursing Administration, ²Professor, Nursing Administration, ³Assistant Professor, Nursing Administration, Faculty of Nursing, Cairo University, Egypt

Abstract

Time management behaviors are considered as determinant of success, and the position of obtaining such skills by managers has been defined more than before.

Aim: this study was conducted to examine the effect of time management training program on the nursing managers’ performance. Research design; Quasi-experimental design utilized to conduct the training program for nursing managers.

Research setting: This study conducted at private hospital affiliated to a University. The study sample; composed of all nursing managers (n = 27) who were actually in the active workforce during the time of data collection.

Data collection tools: Two tools used for data.

Collection: Time management questionnaire, and time management observational checklist. Data was collected after explanation of the aim of the study; also an official administrative approval was obtained. The study was conducted on five phases: preparatory, assessment, planning, implementation, and evaluation phase.

Result: The study results revealed that nursing managers’ knowledge and skills total mean score post program (15.05±1.70) (125±2.45) was higher than pre program (14.00±.00) (109±8.47), and nursing managers’ time management performance total mean score post program (86.65±6.81) was higher than pre program (49.55±16.25). Conclusion; based on the study findings the research hypotheses were approved.

Recommendations: Time management training should be offered to all hospital personnel, especially nurses who tolerate more problems.

Keywords: Time management, Nurse Manager, Performance.

Introduction

Time is an essential resource every manager needs to achieve the goals and objectives of an organization. The challenges that every one facing that time cannot be saved but can only be spent and once misused it can never be regained. Therefore time management can be defined as a period, either short or long, which involves how people use it wisely to produce result or is the act or process of exercising conscious control over the amount of time spent on specific activities, especially to increase efficiency or productivity¹.

Time management may be aided by a range of skills, tools, and techniques used to accomplish specific tasks, projects and goals. This process encompasses a wide scope of activities, including: setting goals, prioritizing, planning, organizing, delegating, scheduling, analysis of time spent and monitoring². Time management in the area of health and for nurse managers has vital importance³ because it is directly related to the people’s health. Time wasting and lack of time management in the domain of nurse managers cause a reduction in efficiency⁴. So, Control and containment of time and improve the ability of managing, retaining human resources, decreasing
stress and increasing job satisfaction among head nurses. A study by Marquis and Huston (2009) demonstrated that the leadership qualities of the unit manager have been shown to have measurable impact on the efficiency, safety and quality of care. Furthermore, it has been suggested that leadership and management skills is key to personal and operational effectiveness. Internationally, this has led to a call for nurse manager’s development.

Management training programs have been shown to be an effective way to enhance nurse manager leadership and management behaviors and performance. The development efforts of the programs need to focus on those management competencies most often associated with successful nurse managers’ outcomes. So, it is important to design such program to raise these management behaviors and performance.

Significance of the Study: It is certain that consequences of time management will benefit both individual and society. Time management is the means into which the individual will develop his time with the best way to attain the best results.

Managing time effectively is an area for nursing managers’ education and training to achieve the organizations’ missions. From this perspective in Egypt where the nurse managers are promoted to their managerial positions without adequate management program preparation, thus they become overwhelmed with organizational and administrative tasks as they are not well equipped with the basic managerial skill and one of these skills is time management, resulted in modest level of unit management.

Ebrahim’s study (2015), revealed statistically significant improvement regarding head nurses performance after attending head nurses’ managerial competencies program also a number of studies demonstrate a positive effect of training programs on subjects’ knowledge and performance. So, it is important to design such program to raise these management behaviors and performance.

Among the offered management training program, time management program was limited, a study conducted by El-Daly (2006), who assessed how nurse managers’ use their time. The study concluded that increasing time wasters and their perception to time management concepts was better than time management skills. Thus designing this program will be important to develop the nurse managers’ time management skills which consequently reflect on their performance.

Aim: This study was conducted to examine the effect of time management training program on the nursing managers’ performance.

Research hypotheses: To fulfill the aim of the study the following hypotheses will be formulated:

H0 (1): There will be higher total mean score of nurse managers’ time management knowledge and skills after attending time management training program than before.

H0 (2): Nurse managers’ time management performance total mean score will increase after attending time management training program compared to pre-program performance total mean score.

Operational definition: Nurse Manager Performance: is defined as nurse manager’s time management behaviors in terms of planning, setting goals and priorities, being disciplined, delegation, preference way for the organization, controlling interruption, negotiating demands, perceiving control of time, and balancing lifestyle.

Materials and Method

Design: Quasi-experimental design was used.

Study sample: The study sample composed of all nursing managers (n = 27) who were actually in the active workforce during the time of data collection and who met the inclusion criteria but during the program 7 nurse managers withdrew from the program.

Inclusion criteria: Educational background: Baccalaureate nursing degree

Years of experience: minimum one year as a nurse manager.

Tools of data collection: The data was collected using two tools:

Tool I. Time management questionnaire. It was modified by the researcher based on Time Management Behavior Scale (TMBS) by Macan, which used to assess the participants’ time management knowledge and skills.
Tool 2 Time management observational checklist. It was modified by the researcher based on Time Management Behavior Scale (TMBS) by Macan 1996, which used to assess the participants’ time management performance.

Procedure was carried out after explanation of the aim of the study also an official administrative approval was obtained from the General Director of the selected hospital. The participants’ performance was assessed by the investigator four times which are: pre, immediate, after one month and after three months of the program implementation using the observation checklist and the observation was done at different days and different time at the work day. Time management knowledge and skills questionnaire was used three times during the study. Which are: pre, immediate, and after three months of the program implementation.

Result and Discussion

Figure (1): frequency distribution of participants’ work specialty (N = 20)

Figure (1) shows that 29.6% of the participants were working at I.C.Us while 3.7% were working at renal, orthopedic, ENT and hematology units.

Figure (2): Frequency distribution of study participants’ age (N = 20)

Figure (2) shows that more than half of the participants’ age (59.3%) ranged from (30-40 yrs) while (3.7%) ranged from 50 years and more.

Table (1) mean difference among nursing managers’ time management knowledge and skills through program phases (N = 20)

Table (1) shows that there was highly statistical significant difference in all participants’ time management skills dimension through program phases (P = 0.000) but there was not statistical significant difference in their time management knowledge (P = 0.012).

Table (2) mean difference among nursing managers’ time management performance through program phases (continued)

Table (2) (continued) shows that there was highly statistical significant difference in all time management performance dimension and also in the total observed time management performance through program phases (P = 0.000) except controlling interruptions and negotiating demands.

---

**Discussion**

It is mentioned in the Arab heritage” Time likes a sword, if you do not cut it, it will tear you apart” as if it passed, it can’t be ever regained. So Nurse Managers often find themselves overburdened with ever increasing workloads and responsibilities and this may not be the ideal time to provide intensive management training. As today the use of time or managing time is a critical issue both for individuals and organizations as part of structured succession planning activities, enabling ward managers to enter their position with knowledge and confidence17.

From this approach, the present study has approved that time management training program can be considered as an effective tool in improving nursing managers’ time management performance as an educational program. As time management training cause individual’s better recognition for working condition and provide situations which enable them to organize the work by proper planning and prioritizing the related work tasks. Time management enables people to overcome the stressful situation in working and life18.
In relation to time management knowledge the present study revealed that the nursing managers knowledge slightly improved after program while remarkable improving was in time management skills in all time management skills dimensions. This improving may be due to that the nursing managers were working without planning, setting tasks prioritization, response to any interruption they face during the work day, and didn’t use effective delegation techniques to save their time.

The previous mentioned result come in accordance with Elsabahy, Sleem, and El Atroush who mentioned in their research entitled as “Effect of Time Management Program on Job Satisfaction for Head Nurses” that all head nurses reported that their response to time management is high (100% response). Those knowledgeable nurse leaders will be able to face the change in health care which has become constant, and sustainability is the major importance. Broad knowledge base and systems thinking knowledgeable nurse leaders who can enable this transformation for a sustainable future approach and opportunities for innovation in healthcare.

In addition to El-Shaer showed, in his research entitled as “Impact of time management program on time wasters of head nurses and their perception toward effective organizational performance” that there were statistical significant positive correlation post program between head nurses level of knowledge, current use of time management skills and their perception of effective organizational performance.

The current study also found that there was highly statistical significant difference in all time management performance dimension and also in the total observed time management performance through program phases and this improving still present after 1 month of program implementation and after 3 month of program implementation but slightly decreased except controlling interruptions and negotiating demands. This improving means that the nursing managers started in using different time management strategies during the day.

This results consistent with Ebrahim’s, who showed in his research entitled as “Developing Head Nurses’ managerial Competencies: an intervention study” that the head nurses time management behaviors improved after the training program through applying different time management skills. In addition there is also a strong relationship between Job performance and time management tactics and strategies in study conducted by Njagi.

Finally the present study showed that the participants of the study were nurse managers and all of participants were highly educated bachelor females this may be due to the majority of the hospital managers and nursing staff are females in the nursing profession in general, as well as the male nurses are relatively new in nursing career especially at baccalaureate level in Egypt and their numbers is still definitely little if it compared to females.

**Ethical Clearance:** A written approval was obtained from the ethics and research committee of the Faculty of Nursing - Cairo University. Written informed consent was obtained from each participants after explaining the nature & purpose of the study. Participants were informed that participation in the study was entirely voluntary, anonymity and confidentiality of the data were assured.

**Conflict of Interest:** The authors declare that there is no conflict of interest.

**Source of Funding:** Self-funding.

A Descriptive Study of the Proportion of Gang Rape in Mthatha, South Africa

Meel B.

MBBS, MD, DHSM (Natal), DOH (Wits), MPhil HIV/AIDS Management (Stellenbosch). Research Associate, Faculty of Health Sciences, Nelson Mandela University, Port Elizabeth

Abstract

Background: Gang rape is one of the most egregious forms of violence and has reached epidemic proportions in South Africa. It is prevalent in all spheres of society and all women are potential victims.

Objectives: To determine the proportion of gang rapes reported in the Mthatha region of South Africa.

Method: This was a retrospective cross-sectional review of all cases of gang rape cases reported by complainants 16 years of age and older, between January 2008 to December 2008, at Sinawe Rape Crisis Center in Umtata General Hospital. Recorded variables included age, number of perpetrators and relation of victim to perpetrator.

Result: Three hundred and seventy cases of rape were recorded of these, 63 (16.6%) were gang rapes. Two perpetrators were involved in 74.6% of rapes, 10 (15.8%) involved three perpetrators, and in 3 (4.8%) cases four perpetrators were identified. Most of the perpetrators 44(69.8%) were not know to the victims.

Conclusion: There is a high incidence of gang rape in Mthatha area of South Africa.

Keywords: Gang rapes, sexual assaults, perpetrators, victims.

Introduction

A considerable number of young people experience non-consensual sex across the world. The brutal and horrific gang rape and murder of a young Indian student on a bus in Delhi brought into focus the magnitude of multiple perpetrator rapes worldwide. Gang rape or group rape is defined as: “a rape in which one or more victims are subjected against their consent to sexual intercourse with two or more offenders.” The incidence of rape in South Africa is extremely high with 28-37% of men admitting, in various studies, to have raped at least once and 7-13% having participated in gang rape. These figures are well summarized in Jewekes et al (2009). During the 2012/2013 financial year 66 000 rapes were reported to the police. However it is believed that if all rapes were reported more than 120 000 women would have been raped annually in South Africa.4

Little research has been carried out on gang rape, despite the fact that it occurs frequently.5 Vetten suggests rates of multiple perpetrator rape as high as 12-27% in South Africa. According to Ullman, gang rape is associated with alcohol and drug involvement, less frequent use of weapons, more nocturnal attacks, less victim resistance, and has more serious bio-psychosocial consequences for the victims than those of single perpetrator victim rapes.6 Gang rape victims reported to police and sought healthcare more often than single offender victims, and were treated more negatively by their communities.6

In South Africa, “jackrolling” or gang rape is reportedly used by young men to ‘punish’ their girlfriends for perceived infidelity or as a way of ending a relationship in which they are no longer interested. Gang rape also occurs in non-intimate

Corresponding Author:
Prof. B. Meel
MBBS, MD, DHSM (Natal), DOH (Wits), M.Phil HIV/AIDS Management (Stellenbosch), Research Associate, Faculty of Health Sciences, Nelson Mandela Metropolitan University, Port Elizabeth 6031 South Africa
partners such as drunken women in bars or girls thought to be virgins. Opportunistic and alcohol driven motives have also been cited as risk factors for gang rape and women who refuse sexual advances by one or more of a group of men may become victims of the violent crime. In other contexts, gang rape is a common occurrence during wartime and it a practice carried out on women who prefer to have sex with women, as a “corrective” measure.

A study from 2009 (the data from our study was from 2008 so the 2009 data was time-appropriate) found that 19.6% of men who had committed rape were HIV positive, suggesting that rape may be a significant factor in the spread of HIV. Injuries to genital tract resulting from the violence associated with rape, further increases the victim’s likelihood of contracting HIV. In multi perpetrator rapes, there is a high probability of at least one of the offenders being HIV positive. In addition, the victim is exposed to the virus to a greater degree if more than one offender is HIV positive, and the victim suffers greater genital trauma due to repeated penetration from multiple assailants. Likewise if the victim is HIV positive, one or more uninfected offenders put themselves at risk. Inequalities in male-female relationships as well as in the social, economic and political structures in South Africa place make women vulnerable to sexual assault as shall be explained later. The objective of this study was to determine the proportion of gang rape in Mthatha region of South Africa and to describe the relationship of the victim to their rapists.

Method

This was a descriptive study of all cases of gang rapes reported by complainants over 16 years of age at Sinawe Rape Crisis Center in Umtata General Hospital from 1st January 2008 to 31st December 2008. Sinawe center is the only center in this region which services a population of approximately 400 000. Most cases were brought to the centre by the police services. Some women were referred from the hospital and health centers and therefore approached the staff directly at the center. The name, age, number of perpetrators and details of the incident were retrieved from the patient’s records. These records are kept confidential and are only divulged for the purposes of the court. The ethical approval has granted under project No. 99/4114 by the ethical committee of the university.

Results

There were 379 cases of rape recorded of these, 63 (16.6%) were gang rapes (Figure 1).

Thirty women were between the age of 16 and 20 years (Figure 2). In 47 (74.6%) cases of gang rape there were two perpetrators, 10 (15.8%) victims were raped by three perpetrators, and three (4.8%) women were sexually assaulted by four perpetrators. (Figure 3) Most of the perpetrators (69.8%) were not know to the victims (Figure 4) whilst 17 (27%) perpetrators were known to their victims. Cousins and ex-boyfriends and their friends each comprised 1.6% of the perpetrators known to the victim. The highest number of gang rapes was recorded in the summer months (January to May) which constituted 60.3% of the total offences (Figure 5).

Discussion

This is a first study of the proportion of gang rape in this region of South Africa. There were 16.6% cases of gang rape over period of 12-months in the year 2008 in this region (Figure 1).

In comparison, Statistics South Africa’s national Victims of Crime survey estimated that 12% of rapes involved two or more perpetrators. A study of 1401 rapes registered between 1996-1998 at Hillbrow Hospital, Lenasia South Hospital and Chris Hani Baragwanath Hospital, in the metropolis of Johannesburg, also in South Africa, found 27% of cases to have involved two or more perpetrators. Mthatha is a former capital of the Transkei homeland, a settlement that existed under the apartheid government of South Africa and has now been incorporated into the Eastern Cape Province. The majority of the population is unemployed and poverty is
rife in this region. There is poor infra-structure such as roads, health services, and communication systems.

Mthatha is only major city in this region to a population of about 4 million. A large number of people, especially young adults migrate to city for their livelihood. Gangs are an example of a subculture in which violence is particularly pronounced especially in the townships and former black homelands. The legacy of apartheid resulted in the emasculation of young black men. It has been suggested that gang-rape may be an act of exerting power over a defenseless victim. It has also may be viewed as a means proving one man’s virility to his friends or acquaintances. Mokena’s study has highlighted how some gangs may engage in a range of criminal activities but changed their actions over time in order to focus on rape. The perpetrators are loosely affiliated to one another in committing this crime.

In our study the victims of gang rape incidents were younger and more likely to be unemployed. Thirty (47.7%) victims of gang rape were between 16 and 20 years of age (Figure 2).

In most cases 47(74.6%) two perpetrators were involved (Figure 3). In 69.8% of incidents, the perpetrators were not known to the victims (Figure 4) of the rapes committed by multiple perpetrators, only one in 10 involved perpetrators known to the victim. An ex-boyfriend was included among perpetrators in one case, while in another a cousin was involved in this study.

Most of the rapes occurred in the summer (Figure 5). The greatest number 9 (14.3%) of gang rapes reported in the month of May of the year, followed by April 8 (12.7%). This is in line with reported by Vetten et al in 2005, where the highest number of incidents of gang rape was also observed in the summer months i.e. May (12%) and October (12%), followed by December (11%). In the context of our study this phenomenon may be explained by groups of people, both men and women, being out till later in the evening and indulging in drug or alcohol use. The widespread incidence of gang rapes noted in this study is a serious social and health issue. The literature has shown that there is a high rate of non-reporting of this crime. The survivors live with severe bio-psychosocial sequelae including the injuries to the genital tract and other injuries she may have experienced during the attack. Psychological and social consequences include depression, post-traumatic stress and social isolation.
Our study is limited by important missing data. We do not have access to the ages of the offenders, their HIV status, history of previous rape or whether or not the accused were under the influence of drugs or alcohol at the time of the attack. These details may not have been taken by the examiner at the time of presentation of the woman to the healthcare facility while some of the information would have been taken by the police and is not available to us. However those variables did not form part of our objectives. Further our study only looked at female victims of gang rape and did not investigate attacks on males.

**Conclusion**

There is a high incidence of gang rape in Mthatha area of South Africa. If we fail to engender a culture of respect toward women by boys and men in this area, then women need to be educated as to how to avoid becoming victims of this barbaric crime. Society at large needs to make an effort to embrace instead of ostracize the victims traumatised by gang rape. Pro-active law enforcement and harsher jail sentences for violent crimes against women and children may also assist in lowering the rates of multiple perpetrator rapes.

**Acknowledgment:** The author would like to thank all staff of the Sinawe Thuthuzela centre for helping to collect data and providing information on police stations in this region.

**Ethical Issue:** The author has ethical permission for collecting data and publication (approved project No. 4114/1999) from the Ethical Committee of the University of Transkei, South Africa.

**Conflict of Interest:** None

**Source of Funding:** It is self-funded.

Topical Approach Versus Systemic Antimicrobial Therapy for Treating Diabetic Foot Infection in Ninevah

Moayad Alabdaly1, Taha Hassan 2, Shahbaa Al Bayati 3

1Lecturer, PhD, Department of Family and Community Medicine, 2Assistant Professor, Department of Surgery, 3Lecturer, Department of Pharmaceutical Medicine, Medical College, University of Ninevah

Abstract

Infection may be a common character of advanced diabetic foot unwellness and therefore the commonest reason for diabetes-related hospitalizations and lower extremity amputations. The topical (local) treatment has the benefits of avoiding systemic adverse effects, providing an enhanced target area concentration, and permitting the utilization of agents not offered for systemic treatment. The aim of this study is to show the effect of topical antimicrobial approach versus systemic antimicrobial therapy for treating diabetic foot infection in Ninevah. We included randomized controlled trial that allocated people individually as a two-group patient, parallel (topical and systemic) studies involving patients with an infected diabetic foot. The results were expressed in a reduction in risk (efficacy) 91% and the relative risk 0.09 with 95% confidence intervals (0.011- 0.696). The results suggest that topical infiltration treatment, when accompanied by appropriate wound care, can provide a therapeutic alternative to a broad-spectrum systemic antibiotic agent.

Keywords: Diabetic foot infection, efficacy, relative risk.

Introduction

Foot infections, a frequent and serious complication of diabetes1,2, are among the most common diabetes related causes of hospitalization and the leading cause of non-traumatic lower limb amputation3. The antibiotic(s) selected must cover the often-polymicrobial organisms that cause these infections. Clinical trials have demonstrated the effectiveness of various systemic antibiotics in treating diabetic foot infection (DFI)4-9. According to the internationally accepted and verified DFI classification, wound depth is an important determinant of severity2,10,11. Thus, a mild wound infection can be amenable to treatment with a locally administered anti-infective agent. Topical treatment has the benefits of avoiding general adverse effects, providing an increased target site concentration, and allowing the use of agents not available for systemic therapy12. An acceptable topical anti-infective agent would demand to demonstrate activity against the spectrum of microorganism that are best known to cause DFI, and it would need to avoid serious adverse effects, interference with wound healing, or induction of drug resistance. To date, no topical anti-infective agent has been well-tried to be effective for treating DFI13. We, therefore, undertook a randomized clinical trial to compare the efficacy of topical treatment with systemic treatment.

Aim of the study: The aim is to show the outcome of topical intralesional antimicrobial approach versus systemic antimicrobial therapy for treating diabetic foot infection in Ninevah.

Objectives:

1. To look out the demographic characteristics and the type of treatment in the patients under study.
2. To study the clinical presentation of the DFI, in the patients under study.
3. To assess the effects of intensive topical antimicrobial approach compared with systemic antimicrobial therapy on the outcome of foot infection in people with diabetes.
4. Measure the association between the treatment duration, the severity of the infection and the frequency of the recurrence according to the type of treatment.

Material and Method

Study Design: We included randomized controlled trial (RCT) that allocated people individually. We
conducted 2 group patient, parallel (topical and systemic) studies involving patients with an infected diabetic foot.

**Patients:** Men or women aged ≥18 years who had diabetes mellitus (according to American Diabetes Association definitions) could potentially be enrolled if they had an infected wound below the malleoli. Infection was defined by the presence of purulent drainage or ≥2 of the following: erythema, warmth, pain or tenderness, or edema or induration.

Patients randomized to treatment with systemic approach (parentally), and those randomized to apply locally infiltrated, directly on the wound and to dress the wound.

During the survey, we categorize the types of lesions, in addition to the results of outcomes, according to the preformed formula.

Investigators used a wound scoring system, based on the system of (Knighton et al.15 as modified by (Pecoraro et al.)16. The minimum treatment course was ≤7 days, but investigators could extend it for up to 28 days or more.

**Description of the intervention:** Since DFIs can progress rapidly and infection is defined clinically rather than microbiologically, there is no reason to delay starting antibiotic therapy if infection is suspected. The selection of an antibiotic regimen should take into consideration the particular needs and other morbidities of the patient as well as the proven or suspected pathogens and their antibiotic susceptibilities. Then, the clinician can decide which specific drug or combination is needed, including the optimal route of administration. This was done after taking a swab for culture and sensitivity, then, according to the results the investigator starting local infiltration of the highly sensitive drug in the wound. This was done after dissolving the vial of selected antibiotic with four ml of distal water and infiltrate only one ml of the dissolving drug at many sites of the infected wound once daily up to healthy granulation tissue perform and then repeat the culture, until the results of culture become negative. The selected antibiotic therapy should always cover Staphylococcus aureus and Pseudomonas aeruginosa, as they are the most frequent and virulent pathogens isolated in DFI of these the three most frequently used antibiotic drug classes were; (Meropenine, Cefipen and Amikacin). However, rarely, in the case of culture results still positive, another antibiotic should be used.

While all DFI in a person with diabetes requires antibiotic therapy, it is often not sufficient. Appropriate surgical procedures (particularly incision and drainage, debridement and excision of infected tissues) and wound care are always needed.

**Analysis of study**

**Clinical outcome:** At each visit, we graded the clinical response as (1) “infection resolved or cured” (all signs and symptoms of infection resolved), (2) “infection improving” (most, but not all, signs and symptoms of infection improved or resolved), (3) “treatment failure” ≥1 signs or symptoms of infection substantially worsening), (4) “recurrence” (a previously cured or improved infection showing worsening of signs or symptoms of infection).

**Wound assessments:** Investigators compiled a “total wound score” that included ratings of signs and symptoms of infection, wound measurements (maximum length, width, and depth), and assessment of granulation tissue. Investigators measured wound area by planimetry of wound tracings and measured the wound depth with a probe.

**Expressing the Results of Randomized Trials:**
The results can be expressed in a number of ways. The risks of developing a disease or complication in each group can be calculated, and the reduction in risk (efficacy) can then be calculated. Another approach is to calculate the ratio of the risks in the two treatment groups (the relative risk). The relative risk (RR) is the ratio of the risk of the event for treating subjects to the risk for controls.

However, to consider the absolute benefit, the absolute risk reduction (ARR), is calculated as the difference in risks. ARR measures how much the local treatment reduces risk compared to the systemic treatment.

Another method, is to estimate the number of patients who would need to be treated (NNT) to prevent one adverse outcome.

**Statistical Analyses:** 95% confidence intervals (CI), of all randomized trials measures were calculated.

Chi-square test (χ²) between the 2 treatment groups for the difference in the portion of patients with either resolved or improving infection versus those who
experienced treatment failure, was used and P-value of ≤ 0.05 was considered to denote statistical significance. Micro Soft Excel 2010 was used for statistical analysis.

Bar chart was used to present continuous variables and tables used for categorical data.

Results

A total of 60 patients was included in this study, as was seen in Table 1.

The results show the pathogens that have been isolated more frequently from wound samples in the intention to treat populations under study, 45.0% (27) are having the pathogens Staphylococcus aureus, while 30.0% (18) of patients are having Pseudomonas aeruginosa as the pathogens of causing the DFI.

Also the study shows that 65% (39) of patients were given topical treatment and 35% (21) of them systemic treatment.

Figure 1, present the use of other treatment needed by the patients.

Concerning the treatment duration, 50% (26.7% of systemic and 23.3% of topical treatment) of the study sample was needed ≥28 days, and 25% of patients were treated for a period 8-14 days (3.3% of systemic and 21.7% for topical treatment).

The duration of antibiotic therapy (with either topical or systemic) was not similar in the 2 treatment groups, and there was statistically significantly different between the 2 treatment arms. The chi-square statistic is 9.4349. The result is significant and p = 0.02403

Table 3 expressing the results of randomized trials, was within the 95% CI and the χ² test for discrete data p = 0.00276, was statistically significant at p ≤ 0.05.
According to the severity of the infection, among those getting resolution, the results were statistically significant by the use of chi-square test ($p \leq 0.05$), as seen in table 4.

*The chi-square statistic is 7.7989 and the result is significant at $p \leq 0.05$.

Discussion

The results support the potential of topical infiltration as a therapeutic alternative to a systemically parental administered antibiotic for treating infected diabetic foot lesions.

We found no differences in population demographic characteristics, except in the residence, the urban patients were 57% of the study sample. This may be those patients are more aware and seeking early medical advice than of the rural population.

The primary endpoint of the studies was a clinical resolution (cure or improvement) of wound infection. The difference in the relative rate (RR) 0.089 (9%) of clinical resolution or improvement, that is, the treated subjects with local infiltration are subject to only a (9%) of the risk to that of systemic treatment in the study sample, as smaller values of (RR) reflect greater treatment benefit. The efficacy of topical treatment is 91% in the study group. This translates that topical treatment is effective in treating 91% of DFI in people with a reasonable problem. However, antibiotic therapy must usually be combined with one or more surgical procedures and should always include Staphylococcus aureus.

According to the severity of the infection, our results demonstrate that, for severely infected diabetic foot ulcers, topical treatment was clinically comparable to a systemic antibiotic. These data suggest that, for severely infected ulcers, topical infiltration treatment, when accompanied by appropriate wound care, can provide a therapeutic alternative to a broad-spectrum systemic antibiotic agent. In addition, topical infiltration treatment appears to be safe and may avoid the selection of resistant bacteria that can develop after oral and (parenteral route) systemic antibiotic therapy.

About the recurrence outcome among those getting resolution, the result is significant at $p \leq 0.05$. Which means that the topical infiltration antimicrobial route of the drugs used is worthy in that the randomized comparisons of antibiotic. Early resolution of the signs of infection also reduces the need for hospitalization and potential morbidity and hastens the healing of the wound.

Conclusion

The results of randomized trials were expressed in a reduction in the relative risk and larger value of efficacy is associated with greater treatment benefit. These suggest that topical infiltration treatment, when accompanied by appropriate wound care, can provide a therapeutic alternative to a broad-spectrum systemic antibiotic agent.

Abstract

Objective: The aim of this study was to evaluates histologically apical closure of autogenously transplanted immature permanent dog teeth treated with 3 different revascularization protocols

Study design: Sixty single-rooted maxillary incisor teeth from ten healthy Mongrel dogs aged 5 months were randomly divided into 3 experimental groups of 20 teeth each. Group I: Autotransplantation without regenerative endodontic procedures. Group II: Autotransplantation with regenerative endodontic procedures after removal of their pulps coronally one week past transplantation. Group III: Autotransplantation after removing pulp tissue from the apical side and treated with regenerative endodontic procedure one week past transplantation. The animals were sacrificed, histologic sections were prepared and three groups were evaluated for apical closure.

Results: Only 37.9% of teeth of all groups showed histological apical closure, with significant differences between the three groups (p = 0.008). Group I showed the maximal percentage (66.7 %) and group II the minimum (20%). When the experimental groups were compared, there were significant differences between groups I and II (p = 0.004), and groups I and III (p = 0.024). While with group II and III; no statistical significant difference was found (p = 0.465).

Conclusion: These results suggest that autotransplantation procedures better done without removal of the original pulp tissue or further regenerative endodontic procedures.

Keywords: Apical Closure, Autotransplantation, Regenerative Endodontic.

Introduction

Surgical movement of a tooth from its original location in the mouth to another site referred as autogenous tooth transplantation1. 2.Early eruption of the lower six makes it highly susceptible to dental caries so; autotransplantation of a third molar to occupy the site of an unrestorable first molar, also autotransplantation including of tooth agenesis to replace other pathological condition would be a good solution for such situations3-5.

Success of autotransplantation commonly depending on the pulp reaction 6, autotransplantation, which maintains the PDL and the possibility for pulp regeneration, revascularization, and re-innervation will considered as the best solution for replacing missing tooth7-9.
It has been demonstrated in earlier that teeth can re-vascularize after autotransplantation if the original pulp tissue is removed at the moment of extraction\textsuperscript{10, 11}, this procedure offers the possibility of tooth cryopreservation and to auto-transplanted in a later stage expecting the pulp chamber will be filled with new vital tissue\textsuperscript{12}.

Teeth with non-vital pulps may achieve apexogenesis using a technique termed “revascularization” the canal is disinfected with an antibiotic paste, and bleeding is stimulated to form a blood clot that allows generation of live tissues in the canal space\textsuperscript{13, 14}, according to the current hypothesis maturation of the root is probably induced by remnant Hertwig’s epithelial root sheath cells, or differentiation of adult stem cells from the remnant apical papilla or circulating stem cells that differentiate and aid maturation\textsuperscript{15}.

Revascularization is the process of restoration of blood supply, while regeneration is the process of renewal and growth of an organ or tissue. For this reason, the term “regenerative endodontic” more accurately describes the physiologic process used in this treatment protocol\textsuperscript{15, 16}.

This study comparing apical closure in autogenously transplanted immature permanent dog teeth treated regenerative endodontic technique and to find out if the apical closure is influenced by the removal of the original pulp tissue.

**Materials and Method**

Sixty single-rooted maxillary incisor teeth from ten healthy mongrel dogs aged 5 months were randomly divided into 3 experimental groups of 20 teeth each. Before any interventions, dogs were kept under the same nutritional and environmental conditions at the animal house, Faculty of veterinary - Cairo University. Antibiotics (Ampicillin 25 mg/kg body weight) were administered 2 days prior to procedures. The involved teeth were radiographically throughout using radiograph paralleling devices to confirm incomplete root formation and open apices as shown in Figure 1.

**Figure 1. Open Apices**

**Group I**, ten non-carious, periodontally sound maxillary right first incisors and ten non-carious, periodontally sound maxillary left first incisors were extracted and autotransplanted alternatively for comparison with Group II and III. The teeth were stored in sterile isotonic saline solution at room temperature till being replanted and after transplantation the teeth were splinted with vycril 3/0.

**Group II**, ten non-carious, periodontally sound maxillary right second incisors and ten non-carious, periodontally sound maxillary left second incisors were subjected to the same autotransplantation procedures. One week past transplantation, under general anesthesia and rubber dam isolation, the access cavities for the maxillary second incisors in the left and right side explored and complete pulpectomy confirmed. Apex locator used to confirm the actual working length and minimal instrumentation done with k-type files. Irrigation done with 5% NaOCl. Then, intracanal medication with antimicrobial agents of equal parts of metronidazole, minocycline and ciprofloxacin in a paste form in the concentration of 20mg/ml prepared. The paste placed carefully into the canals, using a Lentulo-spiral. The access cavities sealed with Cavit. The animal reviewed after two weeks. Under rubber dam, access re-opened and irrigation done with 5% NaOCl and final irrigation made by saline. Using a sterile #45 K-file, periapical over instrumentation done in both teeth to induce bleeding into the canals until the CEJ. Clotting allowed for 15 min and mineral trioxide aggregate placed against the clot. Then access cavities sealed with glass ionomer filling.
In Group III, ten non-carious, periodontally sound maxillary right third incisors and ten non-carious, periodontally sound maxillary left third incisors were autotransplanted after removing their pulp tissue from the apical side with the use of a suitable size nerve broach (Figure 2), and treated with regenerative endodontic procedure one week past transplantation same like group II.

![Pulp tissues removed from the apical side](image)

Figure 2: Pulp tissues removed from the apical side

In all groups animals were returned to their kennels for feeding and medical care and kept on antibiotic therapy for another two days following the procedures.

After 4 months animals were sacrificed and histologically stained by Trichromex stain, each individual root was taken as a unit of measurement/assessment for the histological evaluations. After a training session explaining the gold standard of the different evaluation parameters, two evaluators, blinded to the experimental groups examined the histological slides of the roots and evaluate them for the presence or absence of continued apical closure. The evaluators examined the same slide independently at the same time under identical lighting and magnification conditions by using a multi-headed microscope.

Statistical analysis: The data were analyzed using chi square test, with the level of significance set at \( p < 0.05 \).

Results

Unfortunately, one incisor was lost during the extraction procedure due to root fracture resulting in a sample of 58 teeth as we losing contralateral site as well. This tooth and its contralateral were excluded in the final analysis.

Histologic evidence of apical closure was seen in roots from all experimental groups. In group I, teeth after autotransplantation were allowed to develop normally and apical closure has been found as shown in Figure 3. This was due to deposition of bone-like or cementum-like tissues in the pulp space into the canal walls which lead to increase of thickness of the apical third of some roots as shown in Figure 4a, b. In contrast, teeth in groups II, III showed different grades of arrested dentin and open apex as shown in Figure 5.

Statistical Analysis: Data was tabulated and analyzed using IBM Statistical Package for Social Sciences (SPSS) version 20 for windows. Qualitative data for apex closure was displayed in frequency and percentage. Apex closure comparisons between different study groups was done using chi-square test at significance level \( p < 0.05 \) is presented in Table 1. Only 37.9% of teeth of all groups showed histological apical closure, with significant differences between the three groups \( (p = 0.008) \). Group I showed the maximal percentage of histological apical closure (66.7 %) and group II the minimum (20%). When the experimental groups were compared with each other for histological apical closure, there were significant differences between groups I and II \( (p = 0.004) \), and groups I and III \( (p = 0.024) \). While with comparing group II and III; no statistical significant difference was found \( (p = 0.465) \).
Figure 3. Regenerated soft connective tissue containing a regenerated blood vessel. (Trichromex 100)

Discussion

Mongrel dogs were selected as an experimental models for studying As the dental anatomy of larger species of animals resembles human dentoalveolar architecture as it is similar in radicular structure to immature human teeth in their open apex characteristics, beside short experimental periods because of the high rate of growth, so results are obtained in shorter experimental periods. This was in agreement with the most of old and new experimental researches considered dogs as the major in-vivo testing system for new regenerative devices or techniques.

Only 37.9% of teeth of all groups showed histological apical closure. Group I showed the maximal percentage of histological apical closure (66.7%). This percentage may be explained as a result of stimulus of the necrotic pulp tissue on the cellular activity.

Pulp necrosis occurs a result of autotransplantation of immature teeth is a possible stimulating factor in the repair process of the Pulp, as a result of retro migration of cells from the periodontium into the apical pulp in immature teeth, which act as a periodontal precursor cells can differentiate into odontoblasts, leading to completion of the root growth.

Group II and group III show least percentages of apical closure (20–30%). This result could be consider low percentage of histological apical closure on compartment with other researches have been made regarding regenerative endodontic producers and apical closure of immature permanent tooth in dogs, this may be due to autotransplantation producers in our experiment as a new variable doesn’t been included in other experiments.

Also the disagreement between radiological and histological apical closure results may be explained by the higher accuracy of the histological study compared to radiographic study in assessing apical closure. Which may lead to a high percentage in apical closure. Similar results have been reported by Wang et al. who found 78% of radiographic apical closure, but only 69% of histological apical closure.

Using animal blood clot as a scaffold for hard tissue formation in revascularization procedures may also explain low percentage of apical closure in our study for group II and group III, Thibodeau et al. (2007), who found 59% of roots with histological evidence of apical closure when a blood clot was used, while Zhang et al. (2014), who reported a higher percentage of histological apical closure when Plasma Rich Platelet was used (75%) in comparison with blood clot. In a previous study with the same experimental sample (Rodriguez-Benitez et al., 2016), 43.8% of radiographic apical closure and 34.4% of histological apical closure were found.

In all groups apical closure and thickening of the roots have been found to be a result of formation of two types of tissue that have been found in the pulp space along the dentinal walls. Bone-like tissue and cementum like tissue. Similar findings have been reported by Wang et al. These findings are in agreement with the results reported by Zhu et al who, found no pulp tissues but mainly bone, cementum and periodontal tissues after regenerative endodontic.

Although there were no statistical differences between group II and group III experimental groups for apical closure, group III has shown slight higher percentage of apical closure, which may be due to wide apical foramen of maxillary third incisor more than the apical foramen of maxillary 2nd incisor. While in a previous study on immature permanent dog teeth made to record the influence of removal of the original pulp tissue before autotransplantation in the growth of new tissue in the pulp chamber, the group with the original pulp tissue left in situ comprised (80%) with the pulp chamber totally filled or for at least 1/3 to 2/3 with viable tissue, in contrast the group with the pulp tissue removed before (79%) had no or little vital tissue in the pulp chamber assuming that the revascularization and ingrowth of new tissue is more difficult if the original pulp tissue is removed before transplantation, while this did not make regenerative endodontic producers for the autotransplanted tooth.

Conclusion

Apical closure of the immature permanent teeth with open apex after autotransplantation was possible, and it’s better done without removal of the original pulp tissue or further regenerative endodontic procedures, also the removal of original pulp tissue through the apical foramen before in the autotransplantation procedures before regenerative endodontic treatment has no significant effect in apical closure and completion.

Research Ethical Approval: This study was made with the approval of the Ethical Committee of the faculty of dentistry, Minia University. The institutional and national guide for the care and use of laboratory animals was followed.
Conflict of Interest Statement: The authors declare that there is no conflict of interest. Source of Funding: This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

Abstract

CT scans or Computed Tomography use X-rays to make detailed pictures of the area inside the body. CT brain examinations are used to diagnose the skull, brain, paranasal sinuses, eye sockets and other various head conditions. In the other side, if patients are exposed to greater radiation doses, it is more likely that they develop a cancer or biological effect. This study aims to measure the patient radiation dose during a brain CT procedure and to assess the radiation dose and biological effects.

Six radiology departments in different medical centers were object to this study. These departments are equipped with various CT machines adjusted as stated by international protocols. A number of 180 patients underwent brain CT scans. Effective radiation dose, cancer and biological risks were estimated using the International Commission on Radiological Protection (ICRP) conversion coefficients.

The effective dose for Brain CT procedure in Moroccan hospital varied between (0.80 ± 0.12) and (5.47 ± 1.51) mSv with an average value of (2.96 ± 0.67) mSv. The cancer risk per Brain procedure ranged between 44 and 301 with an average value of 163 per 1 million procedures. The hereditary risk per Brain procedure ranged between 2 and 11 with an average value of 6 per 1 million procedures. The effective dose and risk factors for brain CT scan examination are higher than the national averages for one third of our hospitals.

Patient radiation risks are serious during multiple image acquisition. The current study shows that 66% of the examinations with normal results. Nevertheless, staff ought to optimize the radiation dose during Brain procedures.

Keywords: CT scan, Radiation Risks, Doses. Local DRL Assessment.

Introduction

Since its emergence in 1971, Computed tomography (CT) played a part in a great advancement in the imaging field [¹]. CT is a non-invasive medical test that helps physicians diagnose and treat medical conditions. CT images can reveal bones as well as soft tissue and organs. A CT scanner uses a motorized x-ray source that shoots narrow beams of x-rays as it rotates around the patient there are special digital x-rays detectors located directly opposite the x-ray source. As the x-rays pass through the patient, they are picked up by the detectors and transmitted to a computer.

CT is still widely used for skull pathologies, paranasal sinuses, and eye sockets. It is the first option for people with traumatic brain injury to detect bleeding or edema. New indications for CT are reported daily like CT colonography, coronary CT angiography [²], abscess drainage and much more [³]. However, like all other imaging procedures that use x-ray radiations, CT procedures may generate biological effects⁴, ⁵. High
exposure causes immediate effects on living organisms, like severe radiation burns or radiation sickness that can actually lead to death. These immediate effects are called deterministic, they occur shortly after irradiation, from a few hours to a few months [6, 7]. Exposure to more or less high radiation doses can have long-term effects such as cancer or leukemia, or other hereditary diseases. Stochastic effects occur randomly, unlike deterministic effects, they are not related to a threshold [8]. Ionizing radiation can affect directly the DNA within the nucleus of cells, or indirectly through free radicals, causing cell degradation. Faulty DNA repair can lead to cell mutation. Cancer appears if the mutated cells are not eliminated by the immune system. Hereditary abnormalities occurs when the genetic character of the cells is modified [9]. To estimate the nominal coefficients of risk, the International Commission on Radiation Protection (ICRP) adjusted nominal radiation detriment coefficients for cancer and hereditary effects as follows: $5.5 \times 10^{-2}$ and $0.2 \times 10^{-2}$ Sv for the whole population [10]. Effective dose is the best parameter to assess the health risk from ionizing radiation [11]. Effective dose to patients can be calculated through dose length product (DLP) [12]. Diagnostic reference level (DRL) can be established as the patient has no dose limit [13]. DRLs are used to identify unusually high radiation doses for common diagnostic medical X-ray imaging procedures [14, 15]. DRLs have been set at approximately the third quartile of measured patient data. A conversion factor for brain CT procedures is used to get to the effective dose to patients through DRLs of dose length product (DLP). Morocco has more than 800 Radiology facilities with 1100 devices-RX including CT equipment [16]. Sometimes, patients receive unnecessary doses during brain CT procedures [12, 17, 18]. The scarce studies on the assessment of effective dose during brain CT procedures in Morocco [12, 17, 18] and the lack of previous studies on biological effects that can be resulted from such procedures prompted us to undertake this study. The objectives of this study were to measure the patient radiation dose during a brain CT procedure and to estimate the radiation dose and biological effects.

**Material and Method**

The data come from six radiology department of different medical center in the republic. The machines are routinely controled for quality mesurments and all the measure parameters were inside satisfactory range.

**Patient data:** A number of 180 patients who have undergone a CT brain scan were considered in this study in six different medical centers in Morocco at the rate of 30 patients per hospital. Patient factors (age, gender, examination aim, body region, use of contrast media) and patient dose were taken in. Furthermore, other exposure factors were considered such as gantry tilt, tension (kV), tube current (mA), exposure time, slice thickness, table increment, number of slices, and the positions of scans on patient dose, the visualised CT dose index (CTDi$_{vol}$) and the dose length product (DLP).

**Effective dose calculation:** Effective dose to patients after a CT brain scan is obtained by multiplying dose length product (DLP) by a conversion factor:

$$E_{\text{eff}} = DLP \times F_{\text{DLP}}$$  \hspace{1cm} (1)

For CT brain examinations, the conversion factor taken into account is that of the head and which is $F_{\text{DLP}} = 0.0021 \text{ mSv.mGy}^{-1}.\text{m}^{-1}$ [10].

**Cancer risks estimation:** A risk coefficient $F_{\text{CR}}$ is used to assess the overall cancer risk $R_{\text{CR}}$ per procedure like follows:

$$R_{\text{CR}} = F_{\text{CR}} \times E_{\text{eff}}$$  \hspace{1cm} (2)

The overall cancer risk $R_{\text{CR}}$ is $F_{\text{CR}}=5.5\times10^{-2} \text{ Sv}^{-1}$ presented by ICRP in ICRP 103 [10].

**Hereditary risks evaluation:** Another risk factor coefficient is used this time to estimate the risk of genetic effects $R_{\text{GE}}$ in future generations like follows:

$$R_{\text{GE}} = F_{\text{GE}} \times E_{\text{eff}}$$  \hspace{1cm} (3)

The considered risk factor coefficient is $F_{\text{GE}} = 0.2\times10^{-2} \text{ Sv}^{-1}$ presented by ICRP in ICRP 103 [10].

**Statistical analysis:** The data were analyzed using Statistical Package for the Microsoft Office Excel 2007. DLP (mGy.cm) and CTDI$_{vol}$ (mGy) were considered to get the third quartile value as a reference value for DRL for each hospital and the overall average.

**Results**

A total of 180 CT brain procedures were performed during the data collection period in six different hospitals [12]. TABLE I presents the calculated DRLs of PDL and effective dose during brain CT in each hospital. Effective dose was also analyzed to get the third quartile value as reference value for DRL for each hospital.

Figure 1 shows tube current charge Q(mAs) variation per each medical center included in the current study.

![Fig. 1: Tube current charge Q(mAs) per hospital.](image1)

Figure 2 shows tube voltage U(kV) variation per each medical center included in the current study.

![Fig. 2: Tube current voltage U(kV) per hospital.](image2)

Discussion

The tube current charge Q(mAs) differs from one medical center to another (Figure 1). It varies between 130 and 320 mAs for H6-AGA-HII and H5-RAB-INO respectively. Since there is no significant distinction of most of patients’ conditions, the use of diverse tube current charge for each hospital deems unjustified. Patients then may had been subject to unnecessary radiations. The dose is directly depending on the tube current charge. H4-AGA-CNSS and H5-RAB-INO patients were therefore more exposed because of doses due to more than 200 mAs.

The applied tube voltage U(kV) varies between 118 and 140 kV for H3-AGA-HM and H2-RAB-CNRNS respectively (Figure 2). Two third of the studied hospitals used a tube voltage of 120 kV. A high tube voltage generates x-rays of bigger energy so a beam of bigger penetration strength and it raises the signal/dose ratio. An increase of 120 to 135 kV increases the dose by about 33% [12].

The tube current charge Q(mAs) differs from one medical center to another (Figure 1). It varies between 130 and 320 mAs for H6-AGA-HII and H5-RAB-INO respectively. Since there is no significant distinction of most of patients’ conditions, the use of diverse tube current charge for each hospital deems unjustified. Patients then may had been subject to unnecessary radiations. The dose is directly depending on the tube current charge. H4-AGA-CNSS and H5-RAB-INO patients were therefore more exposed because of doses due to more than 200 mAs.

The applied tube voltage U(kV) varies between 118 and 140 kV for H3-AGA-HM and H2-RAB-CNRNS respectively (Figure 2). Two third of the studied hospitals used a tube voltage of 120 kV. A high tube voltage generates x-rays of bigger energy so a beam of bigger penetration strength and it raises the signal/dose ratio. An increase of 120 to 135 kV increases the dose by about 33% [12].

The applied tube voltage U(kV) varies between 118 and 140 kV for H3-AGA-HM and H2-RAB-CNRNS respectively (Figure 2). Two third of the studied hospitals used a tube voltage of 120 kV. A high tube voltage generates x-rays of bigger energy so a beam of bigger penetration strength and it raises the signal/dose ratio. An increase of 120 to 135 kV increases the dose by about 33% [12].
Table I presents diagnostic reference levels for PDL and effective dose per hospital. The effective dose for Brain CT procedure in Moroccan hospital varied between (0.80± 0.12) and (5.47± 1.51) mSv with an average value of (2.96± 0.67) mSv.

Figure 4 shows a comparison between dose diagnostic levels of effective dose in each studied hospital and the average effective dose level for brain CT. The effective dose for brain CT scan examination is higher than the national averages for one third of our hospitals. The highest exposures are recorded respectively at national center of rehabilitation and neurosciences (CNRNS) and national Institute of oncology (INO) both in Rabat.

According to the calculation made on risk factors based on effective doses, as presented in TABLE II, the cancer risk per Brain CT procedure ranged between 44 and 301 with an average value of 163 per 1 million procedures. The hereditary risk per Brain CT procedure ranged between 2 and 11 with an average value of 6 per 1 million procedures.

Figure 6 shows a comparison of carcinogenic and hereditary risk factors per brain CT procedure between the six hospitals in the current study. The risk factors for brain CT scan examination is higher than the national averages for one third of our hospitals. National center of rehabilitation and neurosciences (CNRNS) and national Institute of oncology (INO) remains respectively of the highest risk per Brain CT procedure because of their high-recorded effective doses.
Figure 7 shows a comparison of carcinogenic and hereditary risk factors per brain CT procedure between the present study and others in some countries around the world. Risks per brain CT procedure in the African region are the highest including the present study.

**Conclusion**

This study aimed to measure the patient radiation dose during a brain CT procedure and to estimate the radiation dose and biological effects. The effective dose for Moroccan hospitals is (2.96± 0.67) mSv. It corresponds to 1408 mGy.cm the first Moroccan DRL for CT brain procedure for adults [12]. The effective dose and risk factors for brain CT scan examination are higher than the national averages for one third of our hospitals. The cancer risk per Brain CT procedure ranged between 44 and 301 with an average value of 163 per 1 million procedures. The hereditary risk per Brain CT procedure ranged between 2 and 11 with an average value of 6 per 1 million procedures. These risks are significant during multiple image acquisition. The study revealed that 66% of the procedures with normal findings. However, staff should optimize the radiation dose during Brain CT procedures. Careful handling of radiation and all associated devices is necessary to prevent or minimize potential unwanted effects.

Chemo Preventive Efficacy of Aspirin in Colorectal Cancer: A Narrative Review Approach

Mohammed Abujamal¹, Mariam Abdalla², Hind Almodaimegh³, Senthilvel Vasudevan⁴

¹Lecturer, Pharmacy Practice Department, College of Pharmacy, King Saud bin Abdulaziz University for Health Sciences, Ministry of National Guard, Health Affairs, ²Lecturer, Pharmacy Practice Department, College of Pharmacy, King Saud bin Abdulaziz University for Health Sciences, Ministry of National Guard, Health Affairs, ³Associate Dean, College of Pharmacy, Female Branch King Saud Bin Abdulaziz University for Health Sciences, Cardiology Clinical Pharmacy Specialist, Program Director, Pharmacy Practice Residency, Cardiology King Abdulaziz Medical City, ⁴Assistant Professor of Statistics, Department of Pharmacy Practice, College of Pharmacy, King Saud Bin Abdulaziz University for Health Sciences (KSAU-HS), Ministry of National Guard Health Affairs, PO BOX 3163, Riyadh 11481, Saudi Arabia

Abstract

Objectives: Our review is focused on aspirin efficacy as a chemo-preventive agent in colorectal cancer (CRC).

Method: We have searched related articles in the following data base through Pub Med, Science Direct, Cochrane Library, Scopus and Google Scholar, restricted to the studies from the year 2000 to 2015. This review focuses on the therapeutic efficacy of aspirin in CRC chemo-prevention. We provide an overview of the association of aspirin treatment with reduction of CRC incidence, recurrence, and CRC-related mortality.

Results: Regular use of aspirin was associated with significant reduction in the incidence and recurrence of colorectal cancer (p = 0.004), lower number of adenomas (p = 0.003), prolonged time of the first adenoma detection (p = 0.02) and lower risk of mortality (p > 0.001).

Conclusion: Regular use of aspirin effectively reduces the incidence of colorectal cancer, its recurrence rate, and its specific mortality.

Keywords: Chemo-Preventive, Aspirin, Recurrence, Efficacy, Colorectal Cancer.

Introduction

Colorectal cancer (CRC) is one of the most common types of cancer and the third leading cause of cancer-associated mortality in the US.¹⁻³ This type of cancer originates from the epithelial cells lining the colon or rectum as a result of genetic mutations (generally in intestinal crypt stem cells)⁴, which may be inherited or acquired. Prevention of these genetic defects and/or their effects on protein expression and function could provide efficient therapeutic strategies. Numerous studies have demonstrated that aspirin has a beneficial effect on several cancer types, including CRC.⁵⁻²¹ Administration of aspirin has been associated with a reduction of CRC incidence, recurrence, and CRC-related mortality.⁵⁻¹⁰, ¹³⁻¹⁵, ¹⁷⁻²⁰, ²²⁻²⁵

This review focuses on the therapeutic efficacy of aspirin in CRC chemo-prevention. We provide an overview of the association of aspirin treatment with reduction of CRC incidence, recurrence, and CRC-related mortality. The main objectives of our present review are focused on aspirin efficacy as a chemopreventive agent in colorectal cancer.
Materials And Method

We have searched related articles in the following data base through Pub Med, Science Direct, Cochrane Library, Scopus and Google Scholar, restricted to the studies from the year 2000 to 2015. This review focuses on the therapeutic efficacy of aspirin in CRC chemoprevention. We provide an overview of the association of aspirin treatment with reduction of CRC incidence, recurrence, and CRC-related mortality.

Results and Discussion

The chemopreventive effects of aspirin in CRC include reduction of CRC incidence, prevention of adenoma recurrence, and reduction in mortality rate.

Reduction of CRC incidence in different risk groups: Several studies have examined the effect of aspirin in reducing the incidence of developing CRC. In a cohort study of 69810 elderly men and 76303 elderly women who received adult-strength aspirin every day for at least 5 years, the incidence of developing CRC was significantly reduced by 32% (95% CI = 0.52 - 0.90). Another study followed up 14033 participants from five randomized clinical trials over twenty years and measured the ability of aspirin to reduce the incidence of CRC on the basis of the cancer site; regular use of aspirin was found to significantly reduce the incidence of proximal colon cancer (P = 0.001) but not distal colon (P = 0.66) or rectal (P = 0.35) cancer. In a study examining the effect of aspirin on reducing the incidence of CRC among 301240 participants, some of whom had first-degree relatives with colon cancer, the risk of developing distal colon cancer was found to be significantly reduced by an average of 16% (95% CI = 0.71 – 0.99). In contrast to the previous study, daily aspirin use significantly lowered the incidence of rectal cancer among subjects either with or without a family history of colon cancer by 24% on average (95% CI = 0.64 – 0.90) and 62% (95% CI = 0.19 – 0.78), respectively.

The long-term effect of aspirin on the incidence of cancers was also investigated in two large randomized trials with post-trial follow-up for more than 20 years through a systematic review of relevant published observational studies. Regular long-term use of aspirin was significantly associated with decreased CRC incidence. In a prospective cohort study of 47363 males, regular aspirin use was found to be associated with lower risk of CRC over 18 years of follow-up (RR = 0.79; 95% CI, 0.69 – 0.90). Among 82911 women who joined the US Nurses’ Health Study cohort, regular use of aspirin was found to be associated with a 23% reduced risk of CRC (95% CI, 0.67– 0.88) over 20 years of follow-up. Moreover, some studies have assessed the effectiveness of aspirin use with respect to an individual’s specific risk for CRC development.

Efficacy of aspirin in average-risk population: In the Women’s Health Study, a large US-population-based randomized 2 × 2 factorial trial that compared the efficacy of aspirin to placebo (with/without vitamin E) among 39876 female participants, the use of low dose aspirin every other day for 10 years did not show statistically significant effects on the risk of CRC (P = 0.83).

Efficacy of aspirin in moderate-risk population: The efficacy of aspirin in moderate-risk populations (i.e., individuals with a history of adenomas or colorectal cancer) has been assessed by four multicenter randomized control trials including between 272 and 1121 participants each. Two of the trials have compared the incidence of CRC between aspirin-treated and no-aspirin-treated groups. No significant differences observed in the relative risk and the absolute risk of CRC (meta-analyzed RR, 0.84; 95% CI, 0.15 - 4.74; p = 0.84; RD, 0.00; 95% CI, -0.02 - 0.01; p = 0.82), with moderate-to-high heterogeneity. However, it is important to note that these studies were primarily designed to assess the differences in adenoma recurrence rate rather than the incidence of CRC.

Efficacy of aspirin in high-risk populations (Familial adenomatous polyposis and Lynch syndrome):

Two international multicenter randomized controlled trials have investigated the efficacy of aspirin in high-risk populations: Colorectal Adenoma/Carcinoma Prevention Programme (CAPP) 1 and 2. In CAPP1, the use of aspirin for more than one year significantly reduced the size (p = 0.02) but not the number of polyps; no data were reported regarding the CRC incidence. In CAPP2, the use of aspirin did not have a statistically significant effect in reducing the risk of developing CRC among carriers of Lynch syndrome (P = 0.33). A study designed to follow-up on the participants of the CAPP2 trial included a longer double-blind, post-intervention follow-up with a re-analysis of cancer incidence performed when the first participants reached a follow-up of 10 years. In this analysis, among
861 participants with a mean follow-up of 56 months, aspirin was associated with lower CRC risk in intent-to-treat analyses (P = 0.05), and the CRC incidence was lower in the aspirin group compared with the non-aspirin group; this difference was significant in a per-specified per-protocol analysis (P = 0.02), but it was not significant in an intent-to-treat analysis (P = 0.12).\(^{(30)}\)

**Prevention of adenoma recurrence:** In many studies, the daily use of aspirin significantly reduced the incidence of colorectal adenomas among subjects with a history of CRC.\(^{(5, 6, 9, 20, 21)}\) In 2003, a randomized clinical trial examined the effect of daily aspirin use in patients with previous CRC; the rate of adenoma recurrence was found to be 27% in the placebo group and 17% in the aspirin group (P = 0.004).\(^{(20)}\) The number of adenomas was also lower in the aspirin group compared with the placebo group (P = 0.003).\(^{(20)}\) The adjusted relative risk of any recurrent adenoma in the aspirin group, compared with the placebo group, was 0.65 (95% CI, 0.46 - 0.91), and the time of detection of first adenoma was longer in the aspirin group than the placebo group (HR, 0.64; P = 0.022).\(^{(20)}\) A similar finding was reported in the same year by other randomized clinical trials.\(^{(6, 9, 21)}\) The first trial examined the effect of daily aspirin use on the prevention of colorectal adenoma recurrence in patients with a history of histologically documented adenomas.\(^{(21)}\) This trial showed that the incidence of recurrent adenomas was lower in the aspirin groups compared with the placebo group (P = 0.04).\(^{(21)}\) The second randomized clinical trial assessed the effect of daily use of soluble aspirin in preventing the recurrence of colorectal adenoma.\(^{(6)}\) It found daily soluble aspirin to be associated with a reduction in the risk for recurrence of adenomas found at colonoscopy one year after starting treatment (P = 0.01).\(^{(6)}\) In 2008, another randomized trial examined the efficacy of aspirin in preventing recurrent colorectal adenomas; aspirin was found to reduce the risk of colorectal adenoma recurrence (95% CI, 0.63 – 0.99).\(^{(6)}\) A meta-analysis of data from these four randomized clinical trials\(^{(6, 9, 20, 21)}\) demonstrated that regular use of aspirin reduced the risk of recurrence of any colorectal adenoma (RR, 0.83; 95%CI, 0.72 to 0.96) over a median follow-up of 33 months.\(^{(5)}\)

**Reduction in mortality rate:** In a cohort study examining the effects of aspirin in improving the survival among 2990 CRC patients, the use of aspirin post-diagnosis of CRC significantly lowered the risk of all-cause mortality and CRC-specific mortality (HR = 0.67, P < 0.001).\(^{(8)}\) This beneficial effect of aspirin on survival among patients with established CRC has also been seen in a prospective cohort study of 1279 CRC patients (stage I, II, and III); the regular use of aspirin after the diagnosis of CRC significantly lowered the risk of CRC mortality by 29% (95% CI, 0.53–0.95).\(^{(18)}\) In the Cancer and Leukemia Group B (CALGB) 89803, a randomized, multicenter study designed to compare regimens of adjuvant 5-fluorouracil/leucovorin with or without irinotecan in 830 patients with stage III colon cancer, regular use of aspirin was associated with improved disease-free survival (HR = 0.48, 95% CI, 0.24-0.99) and overall survival (HR = 0.52, 95% CI, 0.19–1.46).\(^{(23)}\)

Another study examined the deaths due to cancer among daily aspirin users versus controls in eight cardiovascular-prevention randomized control trials and showed that the use of aspirin significantly reduced the cancer-associated mortality (pooled OR 0.79, 95% CI 0.68-0.92, P = 0.003).\(^{(17)}\) However, this study included randomized control trials that were originally designed to examine cardiovascular prevention rather than cancer-associated mortality. Some studies have assessed the effects of pre-diagnosis aspirin use on the survival after CRC diagnosis.\(^{(17, 22, 24)}\) In a prospective case-control study of 79439 women enrolled in the Nurses’ Health Study, the long-term regular use of aspirin was associated with significant reduction in the risk of death from CRC (HR = 0.72, 95% CI 0.56–0.92), this benefit was not detected until after 10 years of regular aspirin use.\(^{(17)}\) In 2009, Zell et al. examined the association between pre-diagnosis use of NSAID and the survival after CRC diagnosis among 114243 women in the California Teachers Study (CTS) cohort followed-up for more than 10 years.\(^{(22)}\) This study has reported that regular pre-diagnosis NSAID use is associated with significantly improved CRC-specific survival (HR, 0.58; 95% CI 0.40-0.84) and overall survival (HR, 0.71; 95% CI 0.53-0.95).\(^{(22)}\) In addition, the prolonged pre-diagnosis NSAID use for at least 5 years was associated with 60% reduction in the risk of CRC-specific mortality (95% CI, 0.23-0.71) and overall mortality (HR, 0.55; 95% CI, 0.37-0.84).\(^{(22)}\) However, in this study, the aspirin-only survival effects were consistent with the observed NSAID effects.\(^{(22)}\) In 2011, Coghillet al. assessed the role of pre-diagnosis NSAID use in the colorectal cancer-specific survival among participants of the Seattle Colon Cancer Family Registry.\(^{(24)}\) The use of NSAID prior to CRC diagnosis was associated with lower mortality (HR, 0.79; 95% CI, 0.65-0.97).\(^{(24)}\) Generally, in most of the previous studies,
the beneficial effects of aspirin on survival appeared to be duration-dependent.

**Conclusion:** Regular use of aspirin effectively reduces the incidence of colorectal cancer, its recurrence rate, and its specific mortality.

Abstract

Introduction: Community and environmental health development are interrelated. This study aims to determine the effect of income and anxiety of rural communities, especially farmers in Sigi Regency, Central Sulawesi on access to education services and access to health services.

Method: This study uses a mixed method between survey and perceptional approaches to obtain qualitative and quantitative data based on the sources. The proportional random sampling uses to assigned 130 farmers. The survey analyzed using statistical package for social sciences (SPSS) software.

Results: Analysis of income and anxiety variables on Education were insignificance with \( p = 0.531 \). There was a Significance relationship between income and anxiety variable to access to non-health care services with \( p = 0.00 \) and Health care facilities \( p = 0.913 \). There is a significant relationship between farmer’s income on the poverty level of rural communities (farmers) with \( p = 0.000 \).

Conclusion: This study found the relation of income and anxiety on the level of access to non-health care services. Also the relationship between farmer’s income on the poverty level of rural communities in Sigi Regency, Central Sulawesi.

Keywords: Anxiety, Income, Education, Health Facilities, Poverty, Farmers.

Introduction

Community and environmental health development are interrelated [1]. The social environment and physical environment are components that build interaction and give each other influence so that in handling it must run in parallel [1,2,3]. Most of the Indonesian population are farmers [4]. The most difficulties faced by farmers in all developing countries are optimum health and education services [4,5,6]. This prompted us to research the Effect of Farmers’ Income and Anxiety on Education, Health Access and the Poverty Level of Rural Communities (Farmers) in Sigi Regency, Central Sulawesi.

Materials and Method

Sampling: This study uses a mixed method between survey and perceptional approaches to obtain qualitative and quantitative data based on the sources. The proportional random sampling uses to assigned 150 farmers of the three regencies as the location for sampling respondents, 150 farmers were actively involved in farming, which was proportionally determined by each; Palolo 60 peoples, Dolo 40, and South Dolo 50 peoples.

Data Collection: Data collection techniques were using a questionnaire. Operational definitions and objective criteria of variables are as follows:

a. Income (X1) is the amount of income of farmers is the recognition of respondents who on average are obtained in one month even when the acquisition is not bound by time and other work outside of their activities as farmers

b. Anxiety (X2) is an anxious condition experienced...
by respondents due to various causes that occur socially because of the socioeconomic conditions experienced by respondents in the community where the concerned person lives his daily life measured using a combination of the Hamilton Rating Scale For Anxiety (HARS) and Psychometric Properties of The Depression Anxiety Stress Scale 42 (DASS).

c. Access to education services (Y1) is determined based on the ability to complete the formal education phase determined by the government until the 12-year compulsory education stage.

d. Health service access (Y2) is determined based on whether the farming community in Sigi regency gets health care services every time they suffer from an illness that requires medical services in both public and private health facilities.

e. Farmer Poverty Rate (Y3) is the amount of per capita income per year divided by the number of family members which is equal to the amount of kg of rice consumed as described by Tangitimbang and Lembongan [7].

1. Very poor if per capita annual income < 240 kilograms of rice,
2. Poor if per capita income is 240 - 320 kg of rice per year
3. Borderline if per capita income is 320 - 480 kg of rice per year
4. Wealth if the annual income per capita is > 480 kg of rice.

Data Analysis: Characteristics every individual tested in a manner correlational between perception individual respondent to involvement in activities socioeconomy as indicator independence economy with analysis correlation Spearman’s Rank. Every difference each partner order squared and calculated the amount, then counted value as $r_c$. Continued make testing Hypothesis of Spearman Rank ($r_s$) with using a T distribution test ($t$-test) level real ($α$) 0.05.

Questionnaire Validity and Reliability:
Instrument Validity Test Results are Valid, obtained with the Value of $r$-Calculate is higher than the Value of $r$-Table (0.1723). The instrument reliability test achieved a reliable result with Cronbach’s Alpha value = 0.746.

Results

There were 130 respondents recruited for this study. As shown in table 1, their income was in the range of IDR 600,000 to Rp. 800,000 (73.85 percent) and those below IDR 600,000 (8.46 percent) and those above IDR 800,000 (17.69 percent). those whose income is below IDR 600,000 per month per capita is classified as poor

Source: SPPS Test Results (2019)
The test results show that (1) all independent variables on access to education services are not significant. This means that even though income & dynamic anxiety will not affect the children of the respondents’ farmers in obtaining education; (2) significant independent variables on health services in non-health facilities, while health services in health facilities are not significantly different; (3) Independent variables (income) affect the degree of poverty while anxiety is not significant.

**Discussion**

Access to education for families of respondents is not affected by two variables tested both income and anxiety. The insignificance of the two independent variables means that for children of compulsory education, whomever they are and from any family, have the opportunity to get educational services \[8,9\]. Law Number 20 of 2003 (National Education System Law, 2003) has arranged for 12 years of compulsory education so that there is no reason for the respondent’s family not to send their children to school \[10\].

United Nations through the Culture, Science and Education Organization (UNESCO 2016) in a book entitled “Education 2030: Incheon Declaration and Framework for Action 4 Sustainable Development Goals: Ensure inclusive and equitable quality education and promote lifelong learning” has emphasized that a nation must place education above all interests and in its implementation do not ignore the sustainability approach\[11\].

The reluctance of a sufferer to visit a health facility is caused by several factors that are considered by the community, starting from the attitude of the servant, distance range, and also related to financing\[12,13\]. Beliefs of servants will influence the comfort of the sufferer so that psychological factors determine the decision of a sufferer in obtaining service \[12, 14\], including financing arising from services received by patients from health facilities. Anxiety due to concerns about the amount of funding is a situation that cannot be avoided by sufferers. A person’s reluctance to visit health facilities is closely related to the financial capacity of low-income families \[13,14\]. So that poverty can be an obstacle for sufferers to get medical treatment \[13,15\]. Even in developing countries where many people live in poor rural areas, the most prominent factors and constraints are finance and anxiety in dealing with health care workers \[16,17\]. Every increase in the illness period of a respondent will experience a frequency of visits of 0.11 to a health facility. Changing one’s thinking to believe in something better requires hard work \[18,19\]. Including farmer, respondents to be convinced that health services in health facilities are better than non-health care health services.

The poverty dimension that has been known generally is still at the level of per capita income per year so that its size is always equated with money or rice consumed. This opinion is not wrong even though other factors that cause a person to become poor still exist, including family dependence and family inability to manage between income and expenditure \[4, 20\], both spending for consumption and family daily needs and health costs that are often not taken into account but are essential items of household expenditure \[4,20,22\].

No significant influence was found between Poverty on the respondents’ Anxiety Level; this was evidenced by the lowest mean value of the indicator of anxiety was feeling depressed at 1.34. This proves that the condition of the respondents, even though they often experience conditions of difficulty sleeping and anxiety, but feelings of depression in facing the severe demands of life are still under control and can live the challenges of life that are in their families. So that it can be said the respondent did not experience significant anxiety which could affect his performance as a farmer to obtain appropriate income. The state of depression can significantly affect one’s performance and independence in achieving an ideal quality of life \[23\].

**Conclusion**

This study found the relation of income and anxiety on the level of access to non-health care services. Also the relationship between farmer’s income on the poverty level of rural communities in Sigi Regency, Central Sulawesi.

Screening of Nutritional Status Based on Mini Nutritional Assessment Short-Form (MNA-SF) among Elderly

Nuning Hartiana Widiastuti¹, Merryana Adriani², R. Bambang Wirjadmadi²

¹Student in Master of Public Health, ²Lecturer in the Departement of Nutrition, Faculty of Public Health, Universitas Airlangga, Surabaya, Indonesia

Abstract

The number of older adults is proliferating in this 21st century, reaching as many as 425 million worldwide in 2000 and estimated almost twice in 2025. In Indonesia, the percentage of older adults in 2017 as much as 7.5%. In line with the increasing of live expectancy of the elderly will grow bigger. That causes the nutrition problem in the elderly and require early identification of risk for malnutrition. Proper nutrition and physical activity have an essential role in making sure the elderly can live healthy, active, and independent lives¹. This study tried to identify the impact of early screening nutrition based on Mini Nutritional Assessment (MNA-SF) of elderly in community². The study relied on the observation that used cross-sectional design and conducted in the elderly community. Results of the study showed that the impact of screening in elderly based on MNA-SF most respondents were able to do activities and do activities well, this could also be attributed to BMI, most respondents were obese. The chi-square test shows that only education level is significant (p < 0.05). An influence between the level of education and risk malnutrition in the elderly is indicated by the value of RR 0.137 (95%CI). The findings in this revised MNA-SF is available for use among the elderly in the community.

Keywords: Elderly, MNA-SF, nutritional status, screening.

Introduction

Success in development can be determined by the increase of life expectancy levels that impact the increase in the number of further residents age (elderly). This condition increased impact also on the decline of infectious diseases and decreased of the disease is not transmitted or called an epidemiologic transition. Interest in optimizing older adults health and promoting successful aging has increasing life expectancy³. Populations statistics indicate that we now have more people aged 65 years and that the aged an increasingly of our population⁴.

Aging is considered a biological process characterized by progressive deterioration of physiological functions and metabolic processes⁵. Adequate nutrition and physical activity had to ensure that the elderly can live longer, healthy, active, and independent lives¹. With the increased risk of illness and accompanied by nutritional disorders in the elderly, it is necessary to identify the risk of malnutrition as early as possible. Assessment of the nutritional status in the elderly is critical because it can describe the current nutritional status and detect the elderly at risk of nutritious⁶.

Anthropometry measurements in assessing nutritional status is a sensitive indicator of community health and nutrition⁷. Anthropometry is an assessment of the direct nutritional status used to see the imbalance of nutrient intake of substances. Nutritional screening is a fast and straightforward and sensitive process to detect the occurrence of malnutrition risk, especially in the elderly. The purpose of screening nutrition to predict outcomes related to nutritional factors. Bodyweight, height, and body mass index constitute a significant component of nutritional screening describing current nutritional conditions⁸.
A rational strategy for nutritional screening in the elderly population is needed. The nutritional screening method used in elderly is a Mini Nutritional Assessment Short Form (MNA-SF). Shortening the MNA more usefully because MNA-SF is a tool developed to evaluate and identify nutritional status in the elderly to prevent early malnutrition and is useful for early treatment before the risk of malnutrition occurs and more efficiently and need a short time to apply than Subjective Global Assessment Form (more specific for the clinical patient).

MNA-SF had six items instead of 18 eliminates time, and personal items can be administrated in approximately three minutes and used for the elderly in community with sensitivity 97.9% and specificity 100% (after compared to MNA). MNA-SF used a score of 10 or less to indicate undernutrition, a score 11 or more to indicate normal nutrition.

The purpose of the research is to identify the preliminary screening results, based on the MNA-SF method, on the elderly in the community.

Material and Method

This type of research is observational research using a cross-sectional design. The study conducted in June 2019. Research using purposive sampling techniques. The research subject amounted to 113 elderly in the community. The criteria of inclusion are willing to be the subject of research evidenced by filling informed consent, aged 58-75 years, can communicate, in a conscious state, can be performed measurements anthropometry (BB (weight loss), TB (height). The screening process conducted with an interview using the MNA-SF taken the elderly in community with the normal category—not risky (points ≥ 12) and risk malnutrition (points ≤ 11). The results of the value with bivariate analysis using Chi-square and bivariate using logistic regression.

Results

Assessment of nutritional status can be done directly or indirectly. Directly assessment of nutritional status in the form of anthropometry measurement, biochemistry test, clinical assessment, and biophysical test while indirectly in three ways: food consumption survey, vital statistics, and ecological factors. The purpose of the assessment of nutritional status will be able to provide preliminary information for the implementation of nutritional therapy and optimal diet in patients.

The last decades have seen the advent of several malnutrition screening tools that have reached increased. The screening tools combine weight loss and body mass index (BMI).

ESPEN recognizes the following risk screening tools to be used in elderly care and community. Mini Nutritional Assessment-Short Form (MNA-SF) used to screen for malnutrition risk.

The first five questions of the revised Mini Nutritional Assessment (MNA-SF) are unchanged for the original MNA-SF, but the sixth question can either be BMI or CC depending on the ability to take these measurements. There some study found that a healthy BMI significantly raises, an increase in BMI reduces life satisfaction and being overweight decrease. The total score and nutritional classifications of this revised MNA-SF are identical to the original MNA-SF and the full MNA.

The results of measurements MNA-SF screening shown in Table 1. There were from six the complete the screen by filling for point A; that 102 respondents (89.18%) have not food intake declined over the past three months, point B; 85 respondents (75,245) did not have weight loss for less than three months, point C; 113 (100%) respondents could mobility or goes out, point D; 90 respondents (79.65%) had not suffered psychological stress or acute disease in the past three months, point E; 33 respondents (29,2%) had mild dementia and 75 respondents (66.38%) no psychological problems and last point F1; almost 89 respondents (21.22%) had obesity.

In the elderly obesity can exacerbate the age-related decline in physical function. Beside it obesity increasing body mass index, fat mass, and risk with degenerative disease. Nutrition is an essential element of health in the elderly and affects aging process. Although the results of screening using MNA-SF showed that most respondents did not experience appetite disorders and weight loss, in older people who experience impaired appetite and decrease energy requirements due to changes in biological and psychological functions.

The results of screening, most respondents were able to do activities and do activities well; this could also be attributed to BMI; most respondents were obese. A cross-sectional study has shown that body weight and body mass index (BMI) increase with age until approximately 50 to 60 years, besides it with age.
body fat increases, and fat mass decreases. The causes of increased fat are multifactorial, and the distribution of fat is different between older people and younger people. The other study found that a healthy weight improves life satisfaction; an increase in BMI reduces life satisfaction.

Despite the results of screening in this research and total the numbers for the final screening score were normal nutritional status. In the elderly need and necessary to evaluate nutritional status routinely at least every three months, as early monitoring and detection before malnutrition occurs in the elderly.

*Significant (p < 0.05)

The Ministry of Health of the Republic of Indonesia had states that some factors affecting the status of elderly nutrition are gender, age, lifestyle, education, occupation, marital status, housing, and economic status.

Some study is stating that the prevalence of malnutrition in the elderly is very high. Another possible factor that could to be malnutrition as body composition change occur differently male and female. Malnutrition occurs at least half of the elderly associated with degenerative diseases. Some research that advanced age is a group that is vulnerable to malnutrition. According to health problems faced by the elderly include increased susceptibility to immune dysfunction is the leading cause.
Conclusion

This research concludes that the screening of nutritional status is crucial in the elderly as early detection to prevent malnutrition. There is an influence between the level of education and risk malnutrition in the elderly with the value of RR 0.137 (95%CI).

Acknowledgment: The authors sincerely thanks to local communities in the research area and the enumerators for their valuable efforts. Furthermore, we also thanked the Faculty of Public Health, Universitas Airlangga, for their valuable support during the study.

Conflict of Interest: The authors stated that they have no conflict of interest.

Source of Funding: The author received funding from Dr. Soetomo General Hospital Surabaya East Java Indonesia to support this research.

Ethical Clearance: Ethical feasibility permit issued by the Health Research Ethics Committee of Dr. Soetomo General Hospital Surabaya, East Java, Indonesia. Ethical feasibility standards are based on WHO-2011 and 2017 KEPPKN guidelines and follow the CIOMS 2016 guideline number 1269/KEPK/VI/2019.

A Health Facility-Based Study on Utilization of Antenatal Care among Myanmar Migrant Women in Five Border Districts of Tak Province, Thailand

Nyunt Naing Thein¹, Wongsa Laohasiriwong², Aung Kay Tu², Thin Thin Soe²

¹Student, Faculty of Public Health, ²Faculty of Public Health, Khon Kaen University, Thailand

Abstract

Introduction: Improving utilization of antenatal care is one of strategies for achieving Millennium Development Goal of decreasing the maternal mortality. Thai Government health facilities provided same Maternal and Childcare services for migrants as Thai citizens. However, migrants’ utilization of ANC services was still challenged by many factors. There was limited information about Myanmar migrants ANC services utilization in Thailand Myanmar border among all five border districts in Tak province, where thousands of Myanmar migrants are living and working.

Method and Materials: Myanmar migrant women who had been living in the five border districts of Tak province, Thailand and delivered in one of the health facilities in five districts in September 2017 to March 2018 were interviewed face to face with a structured questionnaire during 12 weeks after delivery.

Result: In this study, 73.2% of migrant women received adequate AN care (at least four ANC visits), but only 29.9% received early and adequate AN care (the first antenatal visit was in first 12 weeks of pregnancy and at least four ANC visits). The study found that women who lived in other districts (AOR = 5.13, 95% CI = 3.32-7.94), had higher likelihood to get antenatal care than those who lived in Mae Sot district. The women with sufficient health literacy (AOR = 7.46, CI = 4.49-12.42) were also found to have more likelihood to get adequate and early antenatal care.

Discussion: Antenatal care utilization was associated with health literacy level, location of stay, duration of stay, household income, planned pregnancy or not, watched television and having health insurance. The results suggest that, as the vulnerable population at the border area, the migrant women should be targeted for bespoke health education messages on maternal health, especially the importance and necessity of antenatal care visits, especially in Mae Sot District. Promoting health insurance for the migrants would be another effective way to encourage migrant women having adequate and timely antenatal care utilization.

Keywords: Antenatal care, service utilization, Myanmar migrant women, Thailand.
the basic services like health and educations. According to Heaman et al. (5), many researchers documented that inadequate ANC among migrant women was associated with teen age pregnancy, multiparous, single, having poor or fair language competency, less than 5 years of education, an unplanned pregnancy, and not having health insurance.

In this study, Thailand is a receiving country. Soontornprakasit et al. (6) found in the study at Mahasarakham Province in Thailand that average ANC visits was 8.6 times, 99.6% visited at least one time, 98.6% visited at least 4 times, 93.5% accessed to ANC at least 5 times. However, only half of them started ANC within 12 weeks of gestation period. Thai citizens early ANC visit was also still need to improve. Thai Government health facilities provided same Maternal and Childcare services for migrants as Thai citizens. However, there is also lack of information about Myanmar migrants ANC services utilization in Thailand Myanmar border among all five border districts in Tak province, where thousands of Myanmar migrants are living and working.

Methodology

Study sites: The study was conducted in five districts of Tak Province which are bordering with Myanmar; Mae Sot, Tha Song Yang, Mae Ramat, Phop Phra, and Umphang District. The study sites were five Thai Government Hospitals in Mae Sot, Tha Song Yang, Mae Ramat, Phop Phra, Umphang, and a charity organization, Mae Tao Clinic in Mae Sot. All six health facilities offered very low price or free of charge services for ANC and delivery of the pregnant migrant women.

Study subjects: The participants in the study were Myanmar migrant women living in the above five districts and gave birth in one of the aforementioned six health facilities between June to December 2017. The sample size was estimated by using the formula of Hsieh, Bloch, & Larsen (7) for a multiple logistic regression analysis that used to identify the associations between multiple independent variables and a dichotomous outcome of women attending Antenatal Care and its contributing factors at Health Facility Based Survey (8). Sample size from each study site was calculated proportionally according to the number of deliveries of migrant women in the previous year among the facilities; Mae Sot 539 (74.6%), Tha Son Yang 47 (6.5%), Phop Phra 50 (6.8%), Mae Ramat 51 (7.1%), Um Phang 36 (5%). The participants were recruited from the health facilities within twelve weeks after delivery.

Data collection: A structured questionnaire was used to collect data regarding migrant women’s demographic and socio-economic status, previous pregnancy information, awareness about danger signs in pregnancy and health literacy concerning pregnancy and antenatal care. Face to face interviews were conducted for data collection by the trained interviewers at the health facilities. The timing and number of ANC attendances were verified with ANC record books. A pilot study was conducted in Mae Sot and Phop Pra areas to test the validity and reliability of the questionnaire.

Data analysis: The categorical data were described by using frequency and percentage. For Inferential statistics, bivariate analysis was applied to identify the factors associated with Antenatal Care (ANC) utilization (i.e., at least 4 ANC visits and the first ANC visit before 12 weeks of pregnancy). As Hosmer et al stated (9), the factors with p-value < 0.25 were processed into the multivariate analysis using multiple logistic regression. All analyses were performed using Stata version 13.0 (StataCorp, College Station, TX).

Ethical Approval: Approval for this research was received from Khon Kean University Ethics Committee in Human research, (Approval number HE12068 2018-02-13 14-26) and the Research Ethic Committee of Mae Sot Hospital (Approval number MSHP 002/2561).

Results

Descriptive analysis: A total of 723 migrant women were selected in this cross-sectional study. Most of the mothers were in age under 25 years (43.6%) and half of them (53.7%) had stayed in Thailand between 2 to 5 years and nearly three quarters of the women (72.9%) were employed and 55.2% had no health insurance. Regarding legal status, 63.8% had legal stay permit and 77.3% mentioned that the overall incomes were enough for the family. Majority of the study participants (65.3%) lived independently in the communities whereas 16.2% and 18.5% lived in the in the vicinity of agricultural farms and factories where they were working, respectively. Nearly three quarters (74.6%) of the study subjects were from Mae Sot district and the remaining 25.4% lived in other four districts. 230 women (31.8%) received early ANC (i.e., the first antenatal visit was in first 12 weeks of pregnancy) and a total of 529 women (73.2%) had sufficiently took antenatal care (i.e., they made at least four ANC visits). But only 216 subjects (29.9%) utilized early and adequate antenatal care (Table. 1).

Among the participants, 70.5% of women got pregnancy as planned and only 13% and 13.6% had at least one problem in the previous pregnancy and difficulties in last delivery. Regarding knowledge about danger signs in pregnancy 31% could answer three or more danger signs. There were three categories in health literacy about antenatal care and the study subjects were almost equally distributed in the three different levels, around 33% each in inadequate, marginal and inadequate level.

Factors associated with utilization of antenatal care: In the simple logistic regressions analysis variables such as migrant women who stayed in Thailand more than 5 years (COR = 1.35, 95% CI = 0.97-1.89), who had health insurance (COR = 1.54, 95% CI = 1.12-2.12), women whose family financial situation was enough (COR = 1.71, 95% CI = 1.13-2.59), and who lived independently in the community (COR = 1.86, 95% CI = 1.14-3.03) were more likely to utilize early and adequate antenatal care. The study also found that women who lived in other districts (COR = 3.14, 95% CI = 2.21-4.46) had higher likelihood to get antenatal than those who lived in Mae Sot district. The women with higher knowledge of danger signs in pregnancy (COR = 1.81, 95% CI = 1.28-2.57) and sufficient health literacy (COR = 4.76, CI = 3.08-7.35) were found to have more likely to have antenatal care. In multivariate logistic regression analysis sufficient health literacy (AOR = 7.46, 95% CI = 4.49-12.42), and living other districts (AOR = 5.13, 95% CI = 3.32-7.94) had significantly associated with higher probability of getting antenatal care.

Discussion

The study conducted by Myo et al (10) found the rate of ANC utilization in Tak and Samut Sakhon among Myanmar migrants 53% average in both study sites with not mentioned specific site data. In this study, although adequate utilization of ANC was 73.2%, early utilization was only 31.8%. A study in Turkey indicated that antenatal utilization was increasing although the number of early antenatal visits was inadequate (11). The findings of association between ANC and planned pregnancy and health insurance were agreed with other studies (5, 11). Current findings and other scholars’ findings were also similar on family financial situation (12, 13), location of residents (14) and watched TV (15).

The study also revealed that Myanmar migrant mothers who had inadequate level on health literacy in pregnancy, delivery and postpartum and low knowledge about danger signs were more challenging to access quality ANC. Most migrant women in this study had a basic understanding of how to recognize danger signs of pregnancy and danger signs requiring referral to a healthcare facility. However, most of them got inadequate health messages for differentiating between common discomforts of pregnancy and danger signs. The migrant women in our study showed low health literacy for interpreting ANC education even though more than 80% women completed primary education and above. The similar finding about low level knowledge of danger signs in pregnancy was also found to be statistically significant with ANC utilization in Pakistan and in Ecuador studies. (16, 17)

ANC service provision and promotion of utilization should work not only by one sector approach but also multi-stakeholders approach to work together for promoting community health fund pool, health insurance, client centered approach with simple local languages with many illustrations for mothers to understand easily about danger signs and health promotion information about ANC in low socio economic migrant setting in the Thailand-Myanmar border area to improve health literacy.

Limitation of the Study: This study was conducted as health facilities cross sectional study and the study subject were representative of migrant women who delivered in Thai health facilities or Mae Tao Clinic. But then the migrant women who gave birth at home, not at hospitals or clinic and those who returned to Myanmar for delivery were not represented in this study.

Conclusion

The study found 73.2%, of the migrant women received adequate antenatal care, but only 31.8% initiated antenatal care in the optimal first 12 weeks of
pregnancy. Antenatal care utilization was associated with health insurance status, financial situation, planned pregnancy, knowledge of danger signs in pregnancy, women’s levels of health literacy and location of residents. The results suggest that as the vulnerable population at the Thailand-Myanmar border area, the migrant women should be targeted for bespoke health education on maternal health, especially the importance and necessity of antenatal care visits and introduce affordable community-based health insurance.

**Conflicting Interest**

Introduction

Indonesian farmers used to protect their agriculture product from pest using pesticides. Pesticides is a bioactive chemical ingredients that contain toxic material to kill pest organisms. The most popular pesticide which is used in Indonesia were organophosphate and carbamate. These pesticides was known as inhibitor for the cholinesterase enzyme. The decreasing activity of cholinesterase enzyme can be solved by eat some food which contain antioxidant especially phytochemicals acid (vitamin C) and some others phytochemicals. To increase cholinesterase enzyme level in farmers which exposed with pesticide we need to find a natural ingredients that is cheap, easy to find, easy to be processed, and untotoxic. Ginger (Zingiber officinale Roscoe) was a plant that have lots of active ingredients and untotoxic. The aim of this study was to analyse the influence of ginger extract as antioxidant to the cholinesterase enzyme activity of mice that exposed to pesticide. This study was quasi experimental study using post test only control group design. Samples were Swiss Webster male white mice with 20-25 mg of weight, age 3-4 months, healty, and have a normal feces. There were 7 mice in every groups, all samples were 28 mice. Ginger (Zingiber officinale Roscoe) extract (0.001 mg/liter and 0.005 mg/liter) was given using feeding tube to every mice that have been exposed by 0.006 mg/liter of pesticide everyday. The results of cholinesterase enzyme test in mice which exposed by pesticide in control groups were 84%. Treatment groups with 0.005 mgr/liter of pesticide exposing, the cholinesterase enzyme level was 26%, treatment groups with 0.005 mg/liter of pesticide exposing and 0.001 mg/liter, their cholinesterase enzyme were 77%. The K3 groups with 0.005 mg/liter of pesticides and 0.005 mg/liter ginger extract have the average level of cholinesterase enzyme were 57%. We can conclude that ginger (Zingiber officinale Roscoe) extract can influence the cholinesterase enzyme due to pesticide expose.

Keywords: Pesticides, cholinesterase, ginger (Zingiber officinale Roscoe).
personal protective equipment which lead to 90% of them experienced mild poisoning and 10% of them experienced moderate poisoning. (4)

The results of previous research by Rachmaniyah et al. (2017) found that antioxidant in Psidium guajava L extract can be used to protect liver cells membrane from cigarette smokes. It can be seen by identify cirrhosis in mice liver’s cell after it was inducted by cigarette smokes. (5) A research about the influence of ginger extract to protect pesticide exposing have been not found yet. By these we want to analyse the potential of ginger to increase cholinesterase level for the farmers who are exposed by pesticides.

Method

This research was a quasi experimental study using post test only control group design. This design was chosen due to it was the most simple design to devide subject into two groups or more randomly.

Sample Preparation: Samples were Swiss Webster Mice which was adapted in cages for seven days in Biochemical Laboratory of Airlangga University. There were seven mice in every group therefore this study used 28 mice. Samples were devided into 4 groups randomly. Samples were devided using simple random sampling way by lottery. All mice must have 20-25 grams of weight, agile in movements, shiny hair, and glowing eyes.

Pesticide Exposing: All mice were exposed to pesticide everyday within a month. Exposing were done using 60 mL syringe with yellow tip. Pesticides fog then were sprayed and transfered to the cages using nebulizer. This process were done until all the pesticide becomes fog completely.

Ginger Extract: Ginger Extract were given to the mice by feed tube everyday. This extract were powder, it must be dissolved in warm water first. We use 0.005 mg ginger extract powder for 1000 mL of warm water. Sugar was added as it was needed to give taste. This dosage were given to the mice only 1 mL per day within 30 days. The dosage were chosen based on Donatus et al. (1987) in Anam (2015) about Cholinesterase Enzyme level in Farmer’s blood that exposed by pesticide after they take Curcuma zanthorrhiza. (4)

Cholinesterase Enzyme Level Test: This test were done using tintometer test kit. All these tests were done in Biochemical Laboratory of Airlangga University. The results of cholinesterase enzyme level will be categorized below:

1. Normal Poisoning: > 75%-100%
2. Mild Poisoning: > 50%-75%
3. Moderate Poisoning: > 25%-50%
4. Heavy Poisoning: 0%-25%

Cholinesterase Enzyme test has 4 stages, it was:

a. Reagent Test: Indicator and substrate solution were tested with control blood (blood from a person who did not exposed to pesticide or pesticide free).

b. Blood taking: A tube with indicator solution were prepared for control and blood samples. The mice were anesthetized and killed. 1 mL of blood were taken from heart vein using sterile syringe. 0.01 mL of blood samples were put in the tube to be homogenized.

c. Substrate Solution Adding: All tube in seconds stage would be added by 0.5 mL of substrate solution started from control tube, in this time we noted the time as zero. Substrate then was added to every tubes with a minutes interval from zero.

d. Color comparison and results: All tubes will form some colors from green to yellow. These color then compared to the comparator in the tintometer test kit. Every color will be read as percentage of cholinesterase enzyme.

Findings: The results of cholinesterase enzyme level in mice in every groups can be seen in table below.

Table 1. Cholinesterase enzyme concentration in mice groups

<table>
<thead>

<tr>
<td>7</td>
<td>90</td>
</tr>
<tr>
<td>Average</td>
<td>84</td>
</tr>
</tbody>
</table>

The table shows that the average level of cholinesterase enzyme of $K_0$ (Control Groups) was
84%, this result was categorized as normal poisoning (>75%-100%). The average level of K1 groups (exposed by 0.005 mgr/liter of pesticide without ginger extract treatment) was 26%, this result was categorized as heavy poisoning. The average level of cholinesterase enzyme of K2 groups (exposed by 0.005 mg/liter of pesticide with 0.001 mg/liter of ginger extract treatment within a month) was 77%, this result was normal. The last groups K3 (exposed by 0.005 mg/liter of pesticide with 0.005 mg/liter of ginger extract treatment within a month) have 57% of average level of cholinesterase enzyme, this result was categorized as moderate poisoning.

The difference of Cholinesterase enzyme level in every groups can be seen below.

The cholinesterase enzyme level in Ko group (control group) and K1 group (exposed by 0.005 mg/liter of pesticide without ginger extract treatment) was different. The lowest level of cholinesterase enzyme in K0 group was 80% while the highest was 90%. All these results in K0 group was categorized normal. While in K1 group, the average level of cholinesterase enzyme was 26%. This result categorized as moderate poisoning.

This result showed that the exposing of pesticide can affect cholinesterase enzyme level. The decreasing of cholinesterase enzyme level can be indicated that organophosphate compound was entering the body by inhalation. It distributes in the blood and inhibit the cholinesterase enzyme activity. This condition can be normal after 2 weeks. Organophosphate was anticholinesterase. It was irreversible to inhibit enzyme by aging mechanism due to dealkylation from dialkylphosphorylated enzyme intermediates.

The exposing of pesticide make the cholinesterase enzyme activity in central and autonomous nerve system decrease. In a long time period this will make massive stimulate in cholinergic nerve and central nerve system due to aceticholin stimulating which usually function to continue nerve stimulation to the receptors of muscle cells and glands. The accumulation of aceticholin stimulate the sympathetic and parasympathetic central nervous system, so that muscle contraction increases.

The comparation of K1 group (exposed by 0.005 mg/liter of pesticide without ginger extract treatment) result and K2 group (exposed by 0.005 mg/liter of pesticide with 0.001 mg/liter of ginger extract treatment within a month) result showed that K1 has a lower cholinesterase enzyme level than K2. It means that there was an influence after 0.001 mg/liter ginger extract treatment within a month to the cholinesterase enzyme level. All the results in K2 group was normal. So that ginger extract can fix cholinesterase enzyme activity in blood. This happen due to phytochemicals acid (C vitamin) and phytochemical compound. Researches (Fugio, et al.) have been found that ginger has some antioxidant such as gingerdiol, gingerol, cafenic acid, camphene, capsaicin, chlorogenic acid, curcumin, delphinidin, eugenol, ferulic acid, gamma terpinene, isoeugenol, melatonin, myrcene, vanilla acid, vanillin dan zingerone.

K1 group (exposed by 0.005 mg/liter of pesticide without ginger extract treatment) the average level of
Cholinesterase enzyme was 26% and K3 group which was exposed by 0.005 mg/liter of pesticide with 0.005 mg/liter of ginger extract treatment within a month, their cholinesterase was increase to 57%.

Cholinesterase enzyme level in K1 group which was exposed to pesticides decreasing to 26% (moderate poisoning), while in K2 group which was exposed by 0.005 mg/liter of pesticide with 0.001 mg/liter of ginger extract treatment within a month their cholinesterase enzyme level was increasing to 77% and becomes normal. However when we increase the dosage of ginger to 0.005 mg/liter, their cholinesterase enzyme level was decreasing to 57% or becomes mild poisoning.

Based on Aisyah (2002), tocopherol in ginger extract will inhibit malondialdehyde (MDA) formation in mice so that ginger can help to fix cholinesterase enzyme activity in mice only in small dosage (0.001 mg/liter). This happen due to in higher dosage ginger extract can be toxic and kill the mice. 

**Conclusion**

1. Ginger (*Zingiber officinale Roscoe*) extract can influence cholinesterase enzyme due to pesticide exposing in mice. The exposing of 0.005 mg/liter organophosphat pesticides influence cholinesterase enzyme level to 26%.

2. The consumption of 0.001 mg/liter of ginger extract in mice influence cholinesterase enzyme level to 77%.

3. The consumption of 0.005 mg/liter of ginger extract in mice influence cholinesterase enzyme level to 57%.

Solicitude toward Complementary Therapy among Oncology Patients

Reham Samir Fatehallah¹, Hanan Ahmed Al Sebaee², Amel Saied Mahmoud³

¹Clinical Instructor, ²Professor, ³Assistant Professor, Medical Surgical Nursing, Faculty of Nursing, Cairo University, Egypt

Abstract

Many oncology patients use complementary therapy (CT) to overcome the side-effects of conventional treatment without informing health care providers. Many studies were done to assess the knowledge and attitudes of health care providers toward CT, but little studies discussed the knowledge and attitudes of oncology patients toward it. The aim of the present study was to assess solicitude (including knowledge and attitudes) toward CT among oncology patients. A descriptive design was utilized to collect the data from a convenient sample of 300 adult oncology patients through a period of consecutive six months. The main findings revealed that 89.7% of the oncology patients used CT, however, 95% had an unsatisfactory level of knowledge about CT; 87.7% of the patients had a positive attitude toward CT. It can be concluded that although oncology patients had a positive attitude toward CT, they had a lack of knowledge about it. Accordingly, it is recommended to include comprehensive patient assessment and professional guidance for CT use.

Keywords: Solicitude, Knowledge and attitude, Complementary therapy, Oncology patients.

Introduction

Cancer is the second leading cause of death worldwide¹. Globocan estimated that the global cancer cases in 2018 were 18 million cases and the number of deaths from cancer was 9.6 million cases. The incidence rate in Egypt was 314.8 per 100,000². Many treatment regimens were developed to treat cancer such as surgery, radiotherapy, chemotherapy, and others. Those treatments have many serious side effects³. Patients with cancer use many method to overcome these side-effects; one of these method is complementary and alternative therapy.

Complementary therapy (CT) is a group of diverse medical and health care systems, practices, and products that are not generally considered part of conventional medicine but used alongside with it⁴. The prevalence of CT use in cancer is 35-90% in Middle Eastern countries⁵. Moreover National Center for Complementary and Alternative Medicine [NCCAM] divided CT into five main categories including: (a) Biologically based practices as herbal products and nutritional therapy, (b) Energy medicine as therapeutic and healing touch (c) Manipulative and body-based practices as therapeutic massage and chiropractic, (d) Mind-body medicines as meditation and biofeedback and (e) Whole medical systems as ayurveda and traditional Chinese medicine⁶.

Many of CT practices are assumed to be safe. However some natural products may be harmful; some antioxidant herbs such as the herb turmeric, which could be used for reducing inflammation, may inhibit the action of certain chemotherapeutic drugs⁷-⁸. Furthermore, some dietary supplements may cause skin sensitivity and severe reactions when taken during radiotherapy treatment⁹.

Although that, a study¹⁰-¹¹ found that many oncology patients used CT without informing their health care providers believing that if they are “natural, they must be safe”. So oncology patients use CT depending on their knowledge which is mostly gained from people around
them and media rather than medical professionals\textsuperscript{12-13}, and the potential adverse effects of these therapies are minimized or nearly ignored in these sources which increase the risk of those patients\textsuperscript{7}.

However, there are scanty researches to assess oncology patients’ knowledge and attitudes toward CT and most of them were carried out in the developed countries and focused on natural products only. Most studies about attitudes concluded that there was a positive attitude toward CT\textsuperscript{14}. While most studies about knowledge concluded that there is a lack of knowledge regarding natural products\textsuperscript{15-16}. So hopefully the study results might expand the body of knowledge regarding patients’ solicitude of CT including knowledge and attitudes. It also might reveal about their sources of knowledge to evaluate whatever those sources are trusted or not. Therefore the aim of the current study was to assess solicitude toward complementary therapy among oncology patients.

**Research Questions:**

Q1: What is the level of knowledge of the oncology patients about CT?

Q2: What are the sources of patients’ knowledge about CT?

Q2: What is the attitude of the oncology patients toward CT?

**Method**

**Selection and Description of the study sample:** A convenient sample consisting of 300 adult male and female patients with a confirmed cancer diagnosis and able to communicate constituted the study sample through a consecutive six months. The study was conducted at Oncology setting affiliated to Cairo University.

**Tools for Data Collection:** Data was collected using the following tools which were developed by the investigators.

**First tool, Personal and Medical Background Questionnaire (PMBQ);** which included demographic and medical data and knowledge background.

**Second tool, Patients’ Knowledge about Complementary Therapy Use Questionnaire (PKCTUQ);** it included 19 multiple choice questions. Each question had a score of one if the answer was right and zero if the answer was wrong with a total score ranged from zero to 19 and 60% was adopted as the minimum satisfactory level of knowledge.

**Third tool, Patients’ Attitudes toward Complementary Therapy Use Questionnaire (PACTUQ);** it consisted of 18 statements with three responses which were no with one score, undecided with two scores, and yes with three scores with a total score ranged from 18 to 54. The total scores of the scale were transformed into three intervals as a negative, neutral or positive attitude.

**Tools Validity and Reliability:** The tools were reviewed by a jury of five experts in the field of Medical-Surgical Nursing to evaluate their content validity and Modifications were carried out. Reliability was tested using Cronbach’s Alpha as follow (PKCTUQ; PACTUQ; 0.72 & 0.89, respectively).

**Procedure:** Patients were approached individually to conduct a structured interview for 15 to 30 minutes to fill the tool and to record patients’ responses.

**Statistical Analysis:** Data were coded and analyzed using SPSS version 20. Descriptive statistics were used.

**Results**

**Demographic characteristics and background:** More than one third of the study sample cannot read and write and aged between 50≤60 years old with a mean of 43.89±12.02 years. The majority was females, married and lives in an urban area.

*Total number is >98 because each patient could have more than one comorbid disease.

**Total number is >169 because each patient could have >one source of information.

Table (2) revealed that the vast majority of patients used CT and natural products including herbs are the most common used category, such as; anise (ferfew), peppermint, fenugreek, ginger and black seeds. In addition more than half of them reported that the main sources for information about CT were media followed by relatives and friends. Additionally, less than half of them thought that there were no available sources for information with a mean of 3.06±3.3 out of 10.

In reference to table (4), the majority of patients had a positive attitude in their opinion about CT with a mean of 10.65±1.75 out of 12, health care system with a mean of 16.65±2.14 out of 18 and treatment perspective with a mean of 20.77±2.60 out of 24. Additionally, figure (2) confirms that the vast majority had a positive attitude toward CT with a mean of 48.01±5.61 out of 54.

Discussion

Background about CT: The study delineated that the vast majority of patients used CT and herbs are the most common used category as a natural product. These results are supported by a study\(^{17}\) which reported that more than half of patients used CT before cancer diagnosis and the majority used it after diagnosis, also natural products are the most commonly used category. Despite, Sait\(^{18}\) reported that less than quarter of patients used CT, Sait\(^{18}\) supported that herbs are the most commonly used type. While Gonzalez\(^{13}\) reported that the top five used herbs by oncology patients were cinnamon, chamomile, Aloe Vera, garlic and arnica. These differences could be interpreted that there is a difference of the popularity and the availability of plants in countries.

The current study illustrated that more than two thirds of CT users used it for promoting health. This finding was contradicted by Bockover\(^{11}\) who highlighted that the primary reason for CT use was to relieve treatment side-effects. This contradiction could be interpreted by the variation of culture and level of knowledge between the subjects of the two studies.

The current study depicted that more than half of patients reported that the main sources for information were media (television, internet and radio) followed by relatives and friends. From the investigator point of view, this could be attributed, in part, to the widespread, availability and accessibility of the internet and on the other hand to the faith of patient in the family and friends’ opinions. These results are approximately in harmony with a study\(^{12}\) which stated that about three quarters of oncology patients reported that their sources of information were media, friends and other patients.

Level of Knowledge about CT: The current study denoted that the vast majority of patients had an unsatisfactory level of knowledge. This finding is approximately near from a study\(^{16}\) which concluded that the mean of the total knowledge scores was 45.9%±2. However, this result is contradicted with Prince\(^{15}\) who reported that the majority of patients had average and above average levels of knowledge. This incongruity could be explained by the difference of used tools and methodology in both studies.

The current study revealed that the majority of patients had an unsatisfactory level of knowledge for the general information, uses, side effects and
contraindications. However, these results are incongruent with the study\textsuperscript{12} which reported that more than one quarter of patients were aware of the general information about CT, more than one third were aware of its benefits, while about one eighth were aware of the side effects. This discrepancy could be explained by the difference of used tools.

**Attitude Toward CT:** The current study depicted that the vast majority of patients had a positive attitude toward CT. This result is in agreement with Cobb\textsuperscript{18} who reported that the majority of the general population had a positive attitude toward CT with a mean of 55.48±9.83 out of 76.

Moreover, the current study delineated that the majority of patients had the highest scores in the health care system related statements and the lowest were in the treatment perspective related statements. These results are congruent with a study\textsuperscript{19} which concluded that the highest mean score was observed for health care system reported statement, while the lowest was observed for treatment perspective related statement.

**Conclusion and Implications**

The results of the current study revealed that the majority of patients use CT and natural products are the most common used category. The main purpose for CT use was for promoting health. Although the study denoted that the vast majority of patients had an unsatisfactory level of knowledge, most of patients had a positive attitude toward CT. The main sources of information were media followed by relatives and friends.

The study suggested the following implications and recommendations;

- Include patients’ assessment for CT use as a part of general assessment.
- Accurate documentations of CT use
- Establish a clinic in oncology settings for instructing patients about CT.
- Prepare brochures with scientific information about CT for patients.
- Replications of the study using a larger probability sample selected from different geographical areas in Egypt.
- Conduct further studies to evaluate the impact of educational program regarding CT on patients’ outcome.

**Ethical Clearance:** The research approval was obtained from the Research and Ethics Committee at Faculty of nursing, Cairo University and an official permission was obtained from the administrators at study setting. Written informed consent was obtained from each patient.

**Conflict of Interest:** The authors declare that there is no conflict of interest.

**Source of Funding:** Self-funding.

The Relationship of Childbirth Preparation Based on Childbirth Preparation Card with Maternal Morbidity and Fetal Outcomes

Renny Aditya¹, Samuel L. Tobing¹, Zayed Norwanto²

¹Division of Obstetrics and Social Gynecology, ²Functional Medical Staff of Obstetrics and Gynecology, Ulin General Hospital, Banjarmasin

Abstract

This research aims to determine the level of primigravida childbirth preparation through childbirth preparation card (CPC) and its relationship with maternal morbidity, including postpartum hemorrhage and ruptured perineum, and fetal outcomes (APGAR score, Down score and infant mortality). The researcher used a descriptive-analytical method with a cross-sectional approach. Childbirth preparation is assessed using CPC. The research begins from January to April 2019. The sample in this study were mothers who gave birth in Ulin General Hospital of Banjarmasin, which was 100 respondents when the researchers conducted a study with sampling using a purposive sampling technique. There were 76 respondents (76%) stated that they were ready for the childbirth preparation, and 24 respondents (24%) were not ready for preparation. From 76 ready respondents, as many as 73 respondents were not bleeding (93.6%), 47 respondents did not experience perineal rupture (87.0%), 70 respondents with good APGAR score (97.2%), 70 respondents with good Down score (70%) and 74 respondents did not die (80.4%). Childbirth preparation was associated with the rate of postpartum hemorrhage (p<0.0001; OR 92.4), perineal rupture (p=0.005; OR 3.93), APGAR score (p<0.0001; OR 128.33), Down score (p <0.0001; OR 128.33) and infant mortality (p=0.002; OR 12.33). Childbirth preparation is related to the incidence of postpartum hemorrhage, perineal rupture, APGAR score, Down score, and infant mortality.

Keywords: Childbirth preparation, postpartum hemorrhage, perineal rupture, APGAR score, Down score, infant mortality.

Introduction

Pregnancy is a susceptible period in women’s lives, which is vulnerable to the onset of physical and mental disorders. Maternal health care during pregnancy has been carried out for approximately 100 years. Maternal care during pregnancy is an essential part of the health system that aims to maintain maternal health during pregnancy and childbirth so that the health of the mother and baby are maintained.¹

Based on observations of the World Health Organization (WHO) in 2015, the maternal mortality rate (MMR) during pregnancy, childbirth, and childbed amounted to 303,000 people and the infant mortality rate (IMR) was 10,000,000 (WHO, 2015). The MMR in Indonesia is still very high compared to the Association Southeast Asia (ASEAN), wherein 2012 the MMR was 359 per 100,000 live births.²³

Relationship between attitudes of pregnant women and pregnancy care as stated by Jenifer et al. who reported that poor maternal attitudes towards pregnancy care including pregnancy examinations had an impact on the emergence of negative health status in mothers and infants after childbirth.⁴

Materials and Method

In this study, researchers used a descriptive-analytic method with a cross-sectional approach, namely
by collecting data from the number of respondents in a particular time to determine the preparation of primigravida mothers about childbirth and assess outcomes in the mother and baby (fetal). The research instrument is the CPC questionnaire that has been tested for validity and reliability.\textsuperscript{5}

The time of research begins from January to April 2019. This research was conducted at Ulin General Hospital Banjarmasin. The sample in this study were mothers who gave birth in Ulin General Hospital Banjarmasin, which was 100 people with a purposive sampling technique. Inclusion criteria were available to be respondents and Trimester III of primigravida. Exclusion criteria were incomplete history and domicile.

Childbirth preparation was associated with the rate of postpartum hemorrhage \((p<0.0001; \text{OR } 92.4)\), perineal rupture \((p=0.005; \text{OR } 3.93)\), APGAR score \((p<0.0001; \text{OR } 128.33)\), Down scores \((p<0.0001; \text{OR } 128.33)\) and infant mortality \((p=0.002; \text{OR } 12.33)\).

Childbirth preparation was associated with postpartum hemorrhage rates \((p<0.0001; \text{OR } 92.4)\). Clinical features of postpartum hemorrhage in the form of bleeding continues constantly and the patient’s condition gradually become more ugly. Pulse rate so fast and weak, decreased blood pressure, the patient turned pale and cold, and his breathing became congested, breathing-breath, sweating, and eventually coma and death. A dangerous situation is that the pulse and blood pressure only show slight changes for a few moments due to the vascular compensation mechanism. Then this compensation function cannot be maintained anymore, the pulse increases rapidly, blood pressure suddenly drops, and the patient is in a state of shock. The uterus can fill up with enough blood even if it looks just from the outside.\(^5,7\)

Based on the results of the study showed that between childbirth preparation and the incidence of bleeding in the mother had a relationship. For women who are ready to give birth, most did not experience postpartum hemorrhage. It is because the physical and psychological readiness of the mother is getting better because the knowledge of childbirth that has been previously possessed, the experience for mothers can ultimately improve the psychological readiness of the mother. The better the preparation for maternity, the risk of postpartum hemorrhage can be minimized so that the incidence of maternal mortality due to labor and childbirth can be reduced. Therefore, it is expected that couples of childbearing age can prepare childbirth well.

Childbirth preparation was associated with perineal rupture \((p=0.005; \text{OR } 3.93)\). Perineal rupture is a tear that occurs when the baby is born, either spontaneously or by using a tool or action. Perineal rupture is divided into four levels, namely degrees I, II, III, and IV rupture. Perineal rupture generally also occurs in labor if the fetal head is born too quickly, labor is not led properly, scarring of the perineum, and shoulder dystocia.\(^10,11,12\)

Childbirth preparation causes a relatively low rate of perineal rupture. It can happen because of many factors; one of them is preparation carefully of the mother who knows the correct pushing technique and the existence of exercises that cause the perineum, not to stiffen.\(^11,12,13\)

Straining techniques can affect the occurrence of perineal rupture in spontaneous maternity. At the time of delivery, the midwife can provide care by teaching the mother to do the correct straining technique that is when the mother contractions are encouraged to follow the impulse naturally and when straining the mother does not hold back the feeling. When straining at the peak of the contraction, the mother is not allowed to lift the buttocks. In the second stage, when the expenditure occurs due to strong and frequent contractions. When the contraction or pressure occurs in the pelvic floor muscles, which can cause a feeling of wanting to strain, causing the perineum to protrude and become wide and

\(^5,7\)
the anus open, followed by labia minor and major, then the fetal head that appears on the vulva. It is at this time that perineal rupture can occur especially in primigravida labor and to do the wrong straining technique.\[14,15,16\]

Maternal preparation was associated with APGAR scores ($p < 0.0001$; OR 128.33). Based on Apgar score interpretation, if Apgar scores between 4-6, so the baby has not covered asphyxia. If Apgar scores 7-10, baby included in normal childbirth and have adaptations, which is very good with the outside environment. The lower scores on the first-minute test can show that the newborn baby needs medical attention continuously but not necessarily indicate the long term problems, especially if there is increasing scores on the fifth-minute test. If the Apgar score remains under 3 on the next tests (10, 15, or 30 minutes), then there is a risk that the child can experience long-term nerve damage. There is also a small but significant risk of brain damage. However, the purpose of the Apgar test is to determine quickly whether the newborn baby needs immediate medical treatment; and not designed to provide long-term predictions of the health of the baby.\[17,18,19,20\]

Women who received assistance in childbirth gave a good outcome to infant health with a first-minute Apgar score indicator. The research conducted by Liu J (2014) concluded that there were differences in labor with mentoring and without assistance with the baby’s Apgar value in the first minute.\[20,21,22\]

Maternal delivery was associated with a Down score ($p < 0.0001$; OR 128.33) and infant mortality ($p = 0.002$; OR 12.33). Respiratory Distress Syndrome (RDS) is the difficulty or occurrence of respiratory dysfunction in neonates due to several reasons. Fetal period such as a baby born prematurely and multiple births; labor such as excessive blood loss, postmaturity, sectio); and the neonatal period due to neonatorum infection and asphyxia.\[20,22,23\]

It is because the unprepared mother has stiffness from the muscle or cervix that will provide a much larger prisoner and can extend labor while the mother who is ready to give birth is a setback of the flexural power (elasticity) of the tissue that has been repeatedly stretched through practice and exercise. Correlation of childbirth preparations with the complication of pregnancy and birth, namely in gestational age, body weight, premature, respiratory distress syndrome, fetal distress, and asphyxia. The risk of emergency breathing occurs in mothers who are not prepared more than ready mothers. There is a relationship between maternal parity and knowledge of childbirth readiness with the incidence of respiratory distress syndrome in Bari General Hospital Palembang with a value of $p = 0.028$ \[8,15,17,23,24\]

The companion or presence of the second person in childbirth which is to find that mothers who are accompanied by a friend or close relative (especially husband) during labor take place, have a lower risk of complications that require medical action than those without assistance. Mothers with companions in undergoing labor take place faster and easier. In the study, it was also found that the presence of a husband or close relative would bring calm and keep the mother away from stress and anxiety that could complicate the birth and delivery process, the presence of the husband would bring positive psychological effects and had a positive impact on the mother’s physical readiness.\[15,25,26,27\]

**Conclusion**

Primigravida mother who gave birth at Ulin General Hospital Banjarmasin was 76% ready to give birth. As many as 73 respondents who did not experience bleeding (93.6%), 47 respondents (87.0%) did not experience perineal rupture, 70 respondents (97.2%) with good APGAR score, 70 respondents (70%) with good Down scores and 74 respondents (80.4%) have not died. Childbirth preparation is related to the rate of postpartum hemorrhage, perineal rupture, APGAR score, Down score, and infant mortality.

**Ethical Clearance:** This research has gone ethical feasibility testing by the Ethical Research Commission of the Faculty of Medicine, University of Lambung Mangkurat.

Exploring Social Capital for Helping People with Severe Mental Disorders: A Preliminary Study

Retno Lestari, Ah Yusuf, Rachmat Hargono, Ahsan Ahsan, Soebagijono Soebagijono

Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; Study Program of Nursing Science, Faculty of Nursing, University of Brawijaya; Faculty of Nursing, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; Doctoral Program of Public Health, Faculty of Public Health, Universitas Airlangga, Mulyorejo, Surabaya, Indonesia; Study Program of Nursing Science, Faculty of Nursing, University of Brawijaya, Ketawanggede, Malang, Indonesia; Community Mental Health Program Coordinator in Bantur, Malang, East Java, Indonesia.

Abstract

Background: Social capital is a predictor of overall well-being and mental health. Social capital in a collective perspective can affect health outcomes of community members through its shared social norms, collective action and coping. Evidence on the relevance of social capital and people with mental disorders is limited as previous studies discussed social capital aspects mainly at natural-environment level. This paper aimed to explore social capital aspects and social support in community level for people with severe mental disorders in Indonesia.

Method: This study combined a descriptive quantitative and qualitative approach. A sample of 225 health cadres, health care professionals, local public figures and neighbours with a proportional stratified random sampling was used. The data gathering tools consisted of demographic characteristics, Measuring Social Capital in Five Communities in NSW and Social Provisions Scale and analyzed using descriptive statistics. Semi-structured interviews were conducted among 8 participants and analyzed with a qualitative content analysis method.

Result: The results showed that there was a significance relationship between social capital and social support (P=0.000, r=0.605). Three themes emerged from the data: trust them, feels like relatives and need support for improvement.

Discussion and Conclusion: Participants considered that social trust, social network and social support were three factors contribute to mental well-being. Social capital was described as resources to provide social support for people with severe mental disorders in community.

Keywords: Social capital, severe mental disorders, preliminary study, social network, social support.

Introduction

Globally, the prevalence of people with mental disorders increased by 46.4 million and it creates burden to family, community and government. Based on the results of Basic Health Resources in 2018, the prevalence of severe mental disorders in Indonesia has increased fourfold since 2013 from 1.7 per mil to 7.0 per mil. Mistreatment of people with severe mental disorders (PWSMD) still happens in Indonesia, even today. Various efforts related to the management of PSWMD that have been carried out by the government include providing national health insurance for the treatment and “pasung” eradication programs that require enormous costs. Pasung is a physical restraint and confinement of PSWMD in the community. If patient relapses, families...
felt helpless and frustrated with the situation. They also felt saddened and embarrassed with patients’ condition because of stigma about PWSMD. The existence of stigma and discrimination can cause more difficulties and poor recovery as PWSMSD cannot engage in activities independently.\(^3\)

Community has an important role in creating social support and broad opportunities for people with mental disorders to be fully involved in daily activities. Community groups were formed to provide continuous support and maintain therapeutic environments for them.\(^4\)\(^-\)\(^5\) Social capital is one of community resources that could be used to help managing PWSMD. It is a collection of social resources that are inherent and develop in community. It is also a resource that is created by the existence of social relations with other people. It can be used to gain access to certain knowledge and expertise. There are three types of social capital, namely social capital bonding, bridging social capital and linking social capital. Social capital bonding creates a connection between individuals who have emotional closeness, between friends and family. This is found in environments that have the same characteristics. Stronger social ties provide social support and personal assistance for PWSMD. Bridging social capital is a bond formed within a particular social group, which is collided because of differences in demographics and resources in the community. Linking social capital is a network connection that enables community members to interact and share ideas with the local government.\(^6\)\(^-\)\(^9\)

The component of social capital delivers a positive stimulus for community members to trust and involve PWSMD to work and fulfill their needs independently. There are six components of social capital: trust, participation, reciprocity, social norms, values and proactive activities. The aspects of trust, norms of reciprocity and regulations are essentials for fostering mental well-being of community members. Interaction with other community members can raise a sense of belonging, build trust and improve social reciprocal. In addition, lack of trust or social cohesion is associated with higher mortality rates.\(^10\)\(^-\)\(^12\) However, other factors such as geographical limitation in rural areas, financial issues and family problems may also inhibit people with mental disorders to engage in social activities. Improving social capital and social support in rural areas could promote patients’ wellbeing and independence.

In response to limited studies on social capital for helping people with severe mental disorders, this paper aimed to explore social capital aspects and social support in community level for people with severe mental disorders in Indonesia. The findings are expected to shed insight into how to view social capital as vital resources in community, which will extend the horizon of care for people living with severe mental disorders.

**Material and Method**

Over 120 people with severe mental disorders are living in Bantur, Malang, East Java, Indonesia. Community mental health services provide health care for out of hospital mental disorders patients. However, a relapse rate of 50% still remains high, especially when treatment is discontinued. Bantur is located in rural area and most people with severe mental disorders live in near land forest, they have problems with access to health care.

**Instrument Development:** The instruments used in this study were modification of the social capital questionnaire, “Measuring Social Capital in Five Communities in NSW” according to Bullen and Onyx.\(^13\) Eight components of social capital were developed in this questionnaire: (1) Participation in the community in handling PSWMD, (2) Proactive in social activities, (3) Mutual trust and security, (4) Relationships between neighbours, (5) Relationship between family and friends, (6) Tolerance with diversity, (7) Life values and (8) Relationships with work.

In addition, a questionnaire of “Social Provisions Scale” by Weiss (1974) was modified according to the relevance of study. There are six aspects of social support: (1) Social integrity, (2) Attachment, (3) Nurturance, (4) Reliable Alliance, (5) Guidance and (6) Reassurance of worth.

**Data Collection:** A descriptive quantitative study was conducted among 225 respondents consisting of health cadres, health care professionals, local public figures and neighbours through a proportionate stratified random sampling technique. Ethical approval was gained from the Ethical Board of University of Muhammadiyah Malang (Reg.No: E.5.a/002/KEPK-UMM/I/2019). Additional qualitative interviews were conducted among 8 participants to reveal social capital and social support which are important to help people with severe mental disorders. For the in-home interview, the sample included member of societies, health cadres,
health care professionals and local public figures who did not participate in questionnaire. In-depth interviews lasted about 45 minutes and were semi-directed and tape-recorded. All interviews were fully transcribed and analyzed for content. The text was systematically examined, themes were identified and grouped, and categories were coded, classified and developed.

Data Analysis: Data was analysed using SPSS v.24. Kolmogorov-Smirnov sig value on social capital and social support variables was > 0.05, so it can be concluded that the data used was normally distributed. Qualitative interview results were content analysed and categorized by researchers. To enhance trustworthiness, data was checked by all researchers.

Findings

Based on demographic data (Table 1) from 225 respondents, it can be seen that the majority of the population is between 36-50 years old (40%), female (71.6%), private employment (52%) and has a senior high school education level (51.1%).

This study showed that mutual trust and security reached higher mean score compare to other social capital aspects. Health cadres had higher mutual trust and security (10.07±1.33) and proactive in social activities (8.93±1.16). Health cadres found to be more active in motivating PWSMD to gain more activities in community.

This study showed that there was a significance relationship between social capital and social support (P=0.000, r= 0.605). The mean scores of social capital among community members was 55.63±2.41 and social capital mean scores was 66.93±9.28.

Qualitative Results: Semi-structured interviews were conducted in 8 participants who lived in rural area together with 120 people suffered from severe mental disorders. Among 8 participants, 6 (75%) of them were female. The mean age of participants was 41.25 years (range 27 to 60 years). The education level of the sample was one third having attended college. The interview questions were related to social capital and social
support in managing PSWMD in society: how do you handle PSWMD in community; how do you feel when you live close to PSWMD; what will you do when you meet PSWMD. There were three themes emerged from the data: trust them, feels like relatives and need support for improvement.

Table 4. Themes and sub-themes

</tr>
</tbody>
</table>

**Trust Them:** This theme extracted from two sub-themes: have to communicate, need to trust. Communication is the key in delivering and getting responses to mental disorder patients. Communication process is built on the foundation of trust with PSWMD and their families. Effective communication is essential in creating strong relationships and improves social capital. A nurse said, ‘My technique in communication with family is that, only one, which is trust, it fosters our relationships’. Health cadres, ‘This is my key in embracing families to be involved, trust them’. Community members, ‘If we want to help them, we have to talk and communicate with them, we need to know what they need, so we can help them’.

**Feels Like Relatives:** The theme was developed by three sub-themes: feeling empathy, feeling close, help them as relatives. An empathetic attitude is needed in PSWMD care, because with being empathetic they will feel they are getting help. By considering them as relatives, they will be more open with health care professionals. Community members, ‘There is an emotional bond if we live in the same region, in rural, we feel like relatives, we will help, take and give and give each other’. Nurses said, ‘When we see them, we know that we will feel empathy, we just have to help them so they can live like other people’.

**Need Support for Improvement:** This theme was developed from two sub-themes: have to support, deal with stigma. Stigma and discrimination are the biggest barrier to adequate mental health care. The results of the study indicate that there is a strong social stigma attached to PSWMD, this is influenced by the attitude of neighbours who tend to avoid them. Community members, ‘I don’t know about mental health programs for them, we do really need support as we also afraid to talk to them’. ‘Feeling afraid of approaching them but we have to help them as they are also our relatives who live in here’. Health cadres, ‘We still have to help them, giving them support so they can live like us, independent’.

Attitudes and beliefs of most community members who live in rural areas about mental disorders are shaped by personal knowledge, experiences when interact with people with mental disorders and also cultural stereotypes. Besides that, there are various factors influencing attitudes such as mass media, educational and religious institutions, and individual emotional factors as well.

Social capital exists when it is shared between individuals. There is strong relationship between members of societies and PSWMD. Interactions with family, friends, relatives and neighbors enhance emotional or informational social support. Social capital also referred as the strength and density of social ties between society members, as well as other network characteristics such as trust, social reciprocity and shared norms.¹⁴

**Conclusion**

This study addresses the potential of social capital as a fundamental resource for people with severe mental disorders living in the community. Significant development of social support can improve the welfare and stability of mental health.

**Conflict of Interest:** None.

**Source of Finding:** Not required.

**Ethical Clearance:** Self-funded.

Knowledge of Nurses about Prevention of Patient Fall Risk in Inpatient Room of Private Hospital in Medan

Roymond H. Simamora¹, Nurmaini², Cholina Trisa Siregar¹

¹Faculty of Nurses Universitas Sumatera Utara, ²Faculty Comunity of Health Universitas Sumatera Utara

Abstract

Fall risk is an increase in susceptibility to falls, it can cause physical harm. Falls is an incident that causes a person suddenly lie down or accidentally sprawl on the floor. Providing safety to the patient is very important, and to realize patient’s safety especially to reduce injury from the effect of fall risk, the first step required is prevention based of knowledge. The study design was descriptive with Proportional random sampling technique. Research purposes to determine the level of nurses knowledge about prevention the risk of patients fall. An instrument used in this study is a questionnaire. The Population in this study were nurse workers in inpatient ward of Private Hospital in Medan. Samples were 150 nurse workers. The result showed that 57.3% respondents belong to the category of good level knowledge. The results of this study can be an input for the hospital to improving nurse knowledge through the procurement of seminars on prevention of risk patients fall.

Keywords: Identification, Fall Risk, Knowledge, Nurses, patient.

Background

Based on the rate incidence of patients fall every year in all hospitals found in the United States reported data of 700,000 to 1,000,000 people have experience falls every year in the hospital. Reports from hospitals and mental health units in the UK in 2011 were 282,000 patients fall each year, there which 840 had hip fractures, 550 patients had fractures, and 30 had an intra cranial injury(1). In the book “Preventing Fall In Hospital, A Toolkit For Improving Quality of Care” (2013) suggests in the UK about 152,000 falls are reported in acute hospitals each year, with more than 26,000 reported from mental health units and 28,000 from community hospitals (2) . Based on survey conducted by the Hospital Comitee in Indonesian about incidence of patient falls in January-April (2011) reported cases of unexpected events (KTD) and near-accident events (KNC) caused by the patient falls were 5.15% (3). Based on the congress XII report of the Indonesian Hospital Association showed that the incidence of patients falling was included in the three major hospital medical incidents and was secondgrade after the medicine error. Data from the report shows that as many as 34 cases (14%) incident falls occurred in hospitals in Indonesian. Based on the data that got from Private Hospital in Medan about reduce the risk patient falls from January to June 2017 there were 9.2% nurses didn’t do risk assessment patient fall on inpatients, there were 14.2% nurse’s didn’t perform risk management patients fall after doing assessment. This proves that the incidence of patients fall is still high and is still far from the accreditation standard which suggest for the incidence of patient fall is not expected to occur in hospital or 0% incidence. Nurses must be knowledgeable because every intervention to be applied must be based on knowledge.

Method: This study design was descriptive quantitative with Proportional random sampling technique. Samples were 150 nurse workers. This study was conducted from 21 April to 28 May 2018. An instrument used questionnaire.

Based on the results of the study, it is found that the knowledge component of nurses on Prevention of Risk Patient Falls at the most at risk factors falling is 58 people (77.3%).

Discussion

Respondents show that the knowledge of nurses about prevention of patients' fall risk is in good category. The result of this study same with study conducted by (4), there were 96% nurses have level of knowledge about patient safety with good category. The same thing was presented obtained 76.4% nurses have a good level of knowledge (5). This study obtained that knowledge will greatly affect to prevent patient risk of fall. Differential with Enie: 82% of respondents are included in the low knowledge level category (6). This can happen because nurses who workers have low awareness to explore the science of prevention of risk patients fall and this can also be caused by lack of training organized by the hospital which is very affect on the increase of nursing knowledge.

Based on the components of nurses’ knowledge, it was found that the lowest knowledge was falling risk definition, namely 29 respondents (38.7%). This can happen because nurses who work lack a clear understanding of the risk of falling. Understanding is a person’s ability to understand the knowledge he receives. Understanding of knowledge is a cognitive aspect of a person (7). Based on Budiono research, to increase the knowledge of health workers, especially nurses, what needs to be done is socialization and training (8). Based on the results of the study, 77.3% of nurses had good knowledge. The researcher assumes that to carry out the initial assessment of the risk of falling patients, the first thing a nurse must know is the risk factor of falling, so that the nurse does not give a wrong score during the patient’s initial assessment.

In consistent with the theory in JCI (9), Hospitals apply the assessment process to all inpatients who are at falls of risk and use appropriate assessment tools / method with the patient provided by the service. In the component of risk fall assessment element, it was found that the knowledge of the nurse was in good category that is as many as 43 people (57.3%). This indicates that there are still nurses who do not know about the element of risk risk assessment that is as much as 32 people (42.7%), errors in risk assessment fall can be caused by lack of accuracy nurses in terms of scoring the assessment of risk falls, whereas the impact of risk assessment mistakes fall very affect the implementation or intervention to be provided. Errors in this judgment can be fatal, resulting in falling patients affecting the quality and image issues of a hospital (10).

The results of the study showed that nurses’ knowledge about the risk prevention component of risk was still in the low category of 45.3%. Knowledge of nurses can not be caused by education. Notoatmodjo states that the higher the level of one’s knowledge, the better the person’s knowledge (11). According to Simamora: education will affect a person in making decisions so that the higher the level of education a person increasingly understands and understands about a science and will affect their behavior, so that the behavior will be higher compliance (11). This is in line with the research conducted by Kilateng: where it was found that the relationship between nurse knowledge about patient safety and risk prevention measures fell (12). The age range is early adulthood. Early adulthood is a productive age range, where in this range one is usually considered more able to complete social tasks, be more responsible, think rationally, have life experience and adequate education. According to Budiman: age affects the capability and mindset of a person. Increasing age will develop the ability to catch and the mindset of a person so that knowledge gained better. This is in accordance with the results of this study where the results obtained as many as 20 people (54.1%) nurses are in the age range 30-39 years have knowledge in both categories. Another thing that influence the research is gender, in this study it was found that more respondents have female gender that is as much 70 people (93.3%), responder who is good knowledge is female gender that is as much as
42 people (60%). Budiman: states that the individual variables of sex can affect performance, essentially more diligent women than men. In line with research conducted by Prasetyo: stated that more nurses have female gender that is (83.3%), in this research is explained that woman better in patient safety than men, because nursing is still identical with work that fits the nature of women who are more patient, gentle and caring to the patient being treated (3). The results showed that more than half of respondents had the last education background of Diploma nursing that is as many as 57 people (76.5%). Nurses who have a level of knowledge in both categories more respondents who have a Ners educational background that is as many as 15 people (93.8%). The process of education is an experience that serves to develop the ability and quality of one’s personality. According to Budiman, the higher the education of a person is expected also the more extensive knowledge. But that does not mean people who have low education have absolute low knowledge. Increased knowledge is not absolutely obtained from formal education (13). Based on the results of this study, it is found that more nurses have experience> 3 years work is 64 people (85.3%), with knowledge level in good category more owned by nurse with experience 1-3 years work as many as 7 people (87, 5%). As one gets older, one’s experience also involves the senses that affect knowledge. Experience as a source of knowledge is a way to gain the truth of knowledge by repeating the knowledge gained in solving problems encountered in the past. Experience of learning in work developed to provide knowledge and professional skills and experience will be able to develop the ability to make decisions (14). The longer the nurse works the more things you can learn through what you hear, see, and feel at work.

Conclusions

The results showed that 57.3% of respondents belonged to the category of good level knowledge. Improvements need to be made that lead to increased knowledge by conducting activities: socialization, workshops and risk prevention training for falling patients, and also developing supervision and mentoring for nurses.

Conflict of Interest: The authors declare no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

Source of Finding: Directorate of Research and Community Service Directorate General of Strengthening Research and Development of the Republic of Indonesia Ministry of Research, Technology and Higher Education in accordance with the Research and Service Funding Agreement for the Budgetary Community 2018

Ethical Consideration: the study was approved by the central ethics committe of Fakultas keperawatan Universitas Sumatera Utara. Persmission was also obtained from the head Nurse in Hospital Medan. Informed consent was taken from the Nurses individually after explaining the objectives and purpose of the study.

Introduction

Stunting refers to shortness that is deficit or linear growth that has failed to reach genetic potential as the result of poor nutrition in-utero and early childhood. It is estimated that 22.2% or 150 million children under five in the world are affected by stunting in 2017. Stunting is the best overall indicator of children well-being and an accurate reflection of social inequalities as well as human capital index. Stunting is closely related to the lower human capital index since the impact is tend to be permanent such as short adult height, poor cognitive and educational performance in children, and low economic productivity in adulthood.

Background: Indiana is still facing stunting in children under five. Although in 2018 stunting prevalence decreased but it remains high (30.8%). The vastness of Indonesian Country which consists of 34 provinces and 514 districts resulted the difference in population characteristics between province, districts and sub district as well as differences in health issues in each region are important to consider in reducing stunting in addition to the funding requirements needed. Therefore, Indonesian government needs to determine the priority area for stunting intervention. This study is intended to find the relationship between location and stunting prevalence and “hotspot” areas in Indonesia.

Method: The study used aggregate data analysis of Indonesia Basic Health Survey 2018. Moran’s I was used to identify the correlation between location and stunting prevalence. Local Indicators of Spatial Association (LISA) was used to define the hotspot area of stunting. We used R software to process the data.

Results: There was a significant relationship between location and stunting prevalence with Moran’s I = 0.143 (p-value 0.027). We found that Bangka-Belitung, South Sulawesi, West Sulawesi, Yogyakarta and East Nusa Tenggara were the hotspot areas for stunting in Indonesia.

Conclusion: There was a significant relationship between location and stunting prevalence in Indonesia; it means that stunting is not randomly occurred in Indonesia. Bangka-Belitung, South Sulawesi, West Sulawesi, Yogyakarta and East Nusa Tenggara that defined as the hotspot areas of stunting in Indonesia must be prioritized for intervention.

Keywords: Stunting; spatial analysis; Indonesia; stunting hotspot.
and different characteristics of regions and populations between regions. Some studies showed that stunting is related to geographical differences and grouped by region\textsuperscript{14–31}.

Using spatial analyses allows stakeholders to understand that the nutrition burden is different across Indonesia. It could help the decision makers in all region in Indonesia to find out who are living with stunting, what are the causes, where are the hot spots and what kind of intervention should be addressed in particular regions. So, the intervention in certain areas could be different according to the location\textsuperscript{16,18–23,26,27,29,30,32,33}. Some countries with high level of stunting prevalence used spatial analysis to help them making a decision and policy, setting priority area for intervention as well as monitoring nutrition program\textsuperscript{21,26,27,34} and as an affirmation, the suggestion to use spatial analysis was also called in Global Nutrition Report 2018 as a part of five critical steps to accelerate stunting reduction\textsuperscript{34}.

This study is intended to find the relationship between location and stunting prevalence and “hotspot” province in Indonesia. Even if it uses province as a unit of analysis (not the smallest unit of territory in Indonesia), however, the method of determining the hotspot area can be replicated at the district / city level in Indonesia. It is expected that the study will provide a picture of stunting in Indonesia and how it is spatially occurred across Indonesia.

Material and Method

This is an ecological study that used aggregate data (percentage) listed in Indonesia Basic Health Survey 2018 report. Data was collected according to nutrition indicators used in Indonesia Basic Health Survey 2018. The data then entered using excel template that was produced by Geospatial Information Agency.

Ecological study is study that used aggregate data. In epidemiology, ecological study particularly useful to generate a hypothesis or as a descriptive study since the researcher can use the available data as the data often incomplete and lacking information on the multiple factors that contribute to the disease occurrence\textsuperscript{35}. Ecological study has a risk of ecological fallacy means that an association seen in the aggregate (group) level holds true for individual when in fact it does not\textsuperscript{35}. Thus, it is recommended to conduct another analysis for further conclusion such as multilevel analysis or ecological fallacy could be viewed as a form of confounding\textsuperscript{35}. This study will only describe hotspot stunting areas as a hypothesis for further study; however with large number of data, ecological study may develop modelling of cause-effect relationship using both spatial and non-spatial data sources to explain or predict spatial pattern\textsuperscript{36}.

Data analysis was carried out using R software. In order to find the relationship between location and stunting prevalence, we use Moran Index to measure autocorrelation. Steps taken prior to this analysis were choosing a neighborhood criterion and assigning weight to the areas that are linked. For neighborhood criterion, we used k-nearest neighbors’ method to define neighbor (k=5) while regarding weight, we use row standardized weights matrix method. Local Indicators of Spatial Association (LISA) Statistic was used to define the hotspot province of stunting in Indonesia.

Findings

According to WHO prevalence ranges\textsuperscript{37}, Indonesia classified into four areas of stunting prevalence; low (<20%), medium (20-29%), high (30-39) and very high (≥ 40). We found that only 1 province with low stunting prevalence, 12 provinces classified as medium of stunting prevalence, 17 provinces with high prevalence and 2 provinces with high of stunting prevalence. Indonesia is still dominated with high stunting prevalence areas (56% of Indonesia’s provinces).

In term of the relationship between location and stunting prevalence, the statistic hypothesis was $H_0: I = 0$ vs $H_1: I > 0$ with k=5 (k-nearest neighbor). We found that Moran’s Index was 0.143 ($p$-value = 0.027). The Moran’s Index was statistically significant which means that there was a significant autocorrelation between location and stunting prevalence.

Based on Local Indicators of Spatial Association (LISA) Statistic, we found some hotspot areas as described in the table 1:

<table>
<thead>
<tr>
<th>No.</th>
<th>Province</th>
<th>Li</th>

</tbody>
</table>
We found five hotspots provinces in Indonesia, they are Bangka-Belitung, South Sulawesi, West Sulawesi, Yogyakarta and East Nusa Tenggara. In this analysis, DKI Jakarta also recognized as hotspot area but we decided not to include it since it has the lowest stunting prevalence which means that they do not have stunting problem at all. The high correlation value resulted in this area was probably related with the high prevalence of neighbors which we already specified as k=5 while this area itself has low prevalence of stunting.

**Discussion**

In 2018, Indonesia has made a great progress of decreasing stunting from 37.2% in 2013 to 30.8% in 2018. Indeed, this is a great achievement but there are still many home works for Indonesia government. First, the reducing of stunting prevalence has not brought Indonesia into a conclusion that Indonesia has low prevalence of stunting yet. The uniqueness of Indonesia as an archipelago country has brought it with large diversity across the country. There are huge variations regarding geographical characteristics, social culture and demography across all provinces, districts and even within and between all areas in Indonesia. Hence, the government of Indonesia should consider of using spatial data analysis to accelerate efforts in reducing stunting rather than merely generalizing interventions in all areas.

The significant value of Moran I from spatial analysis confirmed that stunting in province in Indonesia are related to the stunting level of the province neighbor (stunting is related with location). Thus, this study confirmed that stunting is clustered in Indonesia (province as unit analysis). Some studies showed the same result in India, Ethiopia, Mexico, Africa and Papua New Guinea.

The analysis of LISA indicated that the hotspot areas are South and West Sulawesi, East Nusa Tenggara, Bangka-Belitung and Yogyakarta. These provinces are highly needed areas where interventions or nutrition program should be strengthened. However, since province is also divided into several districts; it is suggested to carry out spatial analysis and put district as unit analysis.

The spatial analysis already indicated that stunting in Indonesia’s provinces are clustered and affected by neighbor (location) with five hotspot areas in Sulawesi, East Nusa Tenggara, Bangka-Belitung and Yogyakarta. However, since this study used province as unit analysis while in the other, province is still divided into several districts that might be varies as well. Henceforward, it needs further study using spatial analysis with district as unit analysis. By doing this, the analysis result might support the government of Indonesia to determine the priority areas to accelerate reducing stunting in Indonesia in district level and also, mapping the pattern and hotspot areas of stunting in district level can help in improving intervention due to limited resources.

**Conclusion**

We found that stunting in Indonesia is not randomly occurred. The prevalence of stunting is affected by other provinces. The provinces of West Sulawesi, South Sulawesi, East Nusa Tenggara, Bangka-Belitung, and Yogyakarta are highlighted as the hotspot areas of stunting in Indonesia. It is strongly recommended to

Stroke is one of the non-communicable diseases that can cause second death and disability after heart disease. In Indonesia it is the largest stroke country in Asia, while in America 700,000 people experience strokes and cause around 150,000 deaths. In Indonesia, stroke is the number three deadly disease experienced by people after heart disease and cancer. The prevalence of stroke in Indonesia in 2007 was 8.3 per 1,000 and increased to 12.1 per 1,000. Whereas in 2020 an estimated 7.6 million people will die from strokes.

World stroke organizations have conducted research that says that 85% of people are at risk for stroke, but that can be avoided if the trigger factors for a stroke can be controlled from the start. Stroke consists of 2 types, namely ischemic stroke and hemorrhagic stroke, in Asia ischemic stroke is greater (70%) than hemorrhagic stroke (30%).

There are several risk factors that influence the incidence of stroke, both risk factors that can be controlled and factors that cannot be controlled. Risk factors that can be controlled (hypertension, heart disease, sickle cell anemia, smoking, Transient Ischemic Attact, asymptomatic carotid stenosis, hyperlipidemia, obesity, physical activity, diet, diabetes mellitus) and cannot be controlled (age, sex, hereditary, race or ethnicity, genetic and geographical).

Material and Methods

This study was an observational analytic study with a case control design. In the case group was a patient with a diagnosis of ischemic stroke who had received a diagnosis from a doctor by showing the results of a doctor’s examination, while for the control group was a patient with a diagnosis other than ischemic...
stroke treated in Ngimbang Regional Public Hospital of Lamongan. This study was conducted in August to December 2016 at Ngimbang Regional Public Hospital of Lamongan. The population in this study were all patients diagnosed with ischemic stroke and all patients hospitalized in Ngimbang Regional Public Hospital with a diagnosis other than ischemic stroke. The sample in the study was a portion of patients suffering from ischemic stroke and non-ischemic stroke. The sample size in this study was 88 patients who were obtained after calculating the Lemeshow formula. The sampling technique using simple random sampling. This research has passed the ethical review at the Faculty of Public Health at Airlangga University.

Data analysis was performed using univariable analysis using frequency distribution tests to see the characteristics of patients, bivariable tests using Chi-Square test to filter out variables that met the requirements to construct predictive models of ischemic stroke and multivariable models using logistic regression tests used to construct predictive models.

Findings

The Correlation of Characteristics, Abdominal Obesity and Hypertension with Ischemic Stroke in Ngimbang Lamongan Regional Public Hospital

The results of the study regarding the correlation between Characteristics with the incidence of Ischemic stroke in Ngimbang Regional Public Hospital of Lamongan in 2016 can be seen in Table 1 below:

Table 1. Distribution of Characteristics Correlations with Incidence of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan in 2016.

</table>

The results of the analysis in Table 1 show that the age variable with a value of p<0.25 (p = 0.015), which means that the age variable fulfills the requirements to prepare a predictive model of ischemic stroke. Gender variables indicate that the value of p<0.25 (p = 0.001), which means the sex variable fulfills the requirements for preparing a predictive model of ischemic stroke.

Job status variables indicate that the value of p <0.05 (p = 0.001), which means that there is a correlation between work variables and ischemic stroke in Ngimbang Regional Public Hospital of Lamongan 2016.

The results of the study regarding the correlation between abdominal obesity and the incidence of ischemic stroke in Ngimbang Regional Public Hospital of Lamongan in 2016 can be seen in Table 2 below:

Table 2: Correlation Distribution of Abdominal Obesity with Incidence of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan in 2016.

</tr>
</tbody>
</table>

The results of the analysis in Table 2 show that the value of p<0.25 (p = 0.000), which means the abdominal obesity variable meets the requirements to compile a predictive model of ischemic stroke.

The results of the study on the correlation between diabetes mellitus and the incidence of ischemic stroke in Ngimbang Lamongan Regional Public Hospital in 2016 can be seen in Table 3 below:

Table 3. Distribution of Correlation between Diabetes Mellitus with Incidence of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan in 2016.

<table>
<thead>
<tr>
<th>Diabetes Mellitus</th>

<td>44</td>
<td>100.0</td>
</tr>
</tbody>
</table>
The results of the analysis in Table 3 show that the value of \( p < 0.25 \) (\( p = 0.001 \)), which means that the variable of diabetes mellitus meets the requirements to prepare a predictive model of ischemic stroke.

The results of the study regarding the correlation between hypertension and the incidence of ischemic stroke in Ngimbang Regional Public Hospital of Lamongan in 2016 can be seen in Table 4 as follows:

**Table 4. Distribution of the Correlation between Hypertension with Incidence of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan in 2016**

<table>
<thead>
<tr>

<tr>
<td>Total</td>
<td>44</td>
<td>44</td>
</tr>
</tbody>
</table>

In Table 4 shows that the value of \( p < 0.25 \) (\( p = 0.000 \)), which means that the hypertension variable meets the requirements to prepare a predictive model of ischemic stroke.

**Predictive Model of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan**

After a variable bivariate analysis test that fulfills the requirements for a multivariable statistical analysis test can be seen in Table 5 below:

**Table 5. Recapitulation of the Correlation of Variables of Potential Factors with Incidence of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan in 2016.**

The results of bivariate analysis in Table 5 show that all variables have a value of \( p < 0.25 \) which means that all variables in this study qualify to be included in the multivariable statistical analysis test. The variables that will be tested by multivariable statistical analysis are age, gender, abdominal obesity, diabetes mellitus, and hypertension.

Based on the results of the multivariable statistical analysis test in Table 5 the most dominant variable is the variable hypertension followed by the variable abdominal obesity.

Discussion
The Correlation of Characteristics, Abdominal Obesity and Hypertension with Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan

Based on Table 1 shows that there is an association of age factors with ischemic stroke incidence in hospitalized patients in Ngimbang Regional Public Hospital of Lamongan in 2016. People who have age <55 years also have a greater risk of stroke. Ages >55 years will be twice the risk of every 10 years of age. Two thirds of stroke cases are 65 years old. Stroke mortality rates are more common in elderly cases. Table 1 shows that there is a sex correlation with the incidence of ischemic stroke in hospitalized patients in Ngimbang Regional Public Hospital of Lamongan in 2016. The results of other studies indicate that the risk of stroke in hypertensive patients male sex 23.07 times greater stroke compared to women, this shows that in terms of gender the incidence of stroke is more common in men. Based on employment status variables (Table 1) shows that there is a correlation between work and incidence of ischemic stroke in hospitalized patients in Ngimbang Regional Public Hospital of Lamongan in 2016. This is because people who do not work will tend to live more relaxed, irregular eating patterns, lazy to exercise and higher stress levels than people who work. If the stress is too large so that it can cause a decrease in endurance, symptoms will arise such as headaches, irritability, insomnia which will stimulate the adrenal gland (cortex) to release hormones adrenaline and will accelerate the heart rate so that blood pressure rises and blood flow to the brain and peripheral muscles increases.

Respondents with abdominal obesity status had a greater risk than respondents with no abdominal obesity (Table 2). Abdominal obesity as measured by waist circumference is said to be the main risk factor for developing insulin resistance in type 2 diabetes, about 50% of obese patients experience glucose tolerance. In accordance with the research that has been carried out that people with type 2 diabetes mellitus will increase the risk for ischemic stroke.

Respondents with diabetes mellitus had a greater risk than respondents who did not have diabetes mellitus. Respondents with diabetes mellitus had a 28.500 risk of ischemic stroke when compared to respondents who did not have diabetes mellitus (Table 3). Diabetes mellitus will cause the vascular constriction phase and damage to blood vessels through the glycosylation process. Meanwhile, if there is a change in the two blood vessels, it will cause a reduction or even cause a blockage of blood flow to the brain which will cause ischemic stroke.

Respondents with hypertension status had a greater risk than respondents with non-hypertensive status. Respondents with hypertension had a risk of 129.000 times having an ischemic stroke when compared to respondents without hypertension (Table 4). Other studies have shown that patients with hypertension have a 20 times greater risk of stroke compared to patients without hypertension. Other studies show that individuals who have a diastolic blood pressure of ≥90 mmHg have a risk of 3.10 times more likely to experience an ischemic stroke.

Predictive Model of Ischemic Stroke in Ngimbang Regional Public Hospital of Lamongan

Through multiple logistic regression test results, it can be arranged formula predictive index for the incidence of ischemic stroke in Ngimbang Regional Public Hospital of Lamongan 2016. The logistic regression equation is as follows:

\[ Z = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_n x_n \]

So that the model of equations that are formed for the incidence of ischemic stroke is obtained as below:

\[ Z = -11.273 + 4.094 \times \text{Hypertension} + 3.325 \times \text{Abdominal Obesity} + 3.218 \times \text{Age} + 3.072 \times \text{Sex} + 2.369 \times \text{Diabetes Mellitus}. \]

From the calculation of the predictive index, the value of \( Z = 4.805 \) is obtained. With a history of hypertension = yes (1), abdominal obesity = yes (1), age = ≥55 years (1), gender = male (1), history of diabetes mellitus = yes (1).

Based on the 5 variables (age ≥55 years, male sex, abdominal obesity, history of hypertension and history of diabetes mellitus) if calculated based on probability events the results are as follows:

\[ P = \frac{1}{1 + e^{-Z}} \]

\[ Z = -11.273 + 4.094 \times \text{Hypertension} + 3.325 \times \text{Abdominal Obesity} + 3.218 \times \text{Age} + 3.072 \times \text{Sex} + 2.369 \times \text{Diabetes Mellitus}. \]
Based on the logistic regression equation, it can be seen that 98% of the probability of ischemic stroke caused by age ≥55 years, male sex, abdominal obesity ≥80 cm (female) and ≥90 cm (male), history of hypertension and history of diabetes mellitus, while 2% is influenced by other factors that are not measurable.

**Conclusion**

The incidence of ischemic stroke in hospitalized patients in Ngimbang Regional Public Hospital of Lamongan in 2016 it can be concluded that 98% of the likelihood of ischemic stroke caused by age ≥ 55 years, male sex, abdominal obesity ≥80 cm (female) and ≥90 cm (male), history of hypertension and history of diabetes mellitus, while 2% is influenced by other factors that are not measurable.

**Suggestion:** Further researchers are expected to examine more risk factors that can be changed to explain more specifically the occurrence of ischemic stroke, such as the risk of diabetes mellitus which types are more at risk for ischemic stroke, comparing abdominal obesity and BMI to the risk of ischemic stroke and other factors.

**Conflict of Interest:** None

**Source of Funding:** Independent

**Ethical Clearance:** This Study was approved by Health Research Ethics Committee of Public Health, Airlangga University.

Enhancing Family Medicine Practice in Developing Countries through a Holistic-Comprehensive Care Model: A Review

Stefanus Supriyanto¹, Ernawaty², Febri Endra Budi Setyawan³, Retno Lestari⁴

¹Professor, Department of Health Administration and Policy, Faculty of Public Health, Universitas Airlangga Surabaya, JI Mulyorejo kampus C Unair Surabaya, Indonesia, ²Department of Health Administration and Policy, Faculty of Public Health, Universitas Airlangga Surabaya, JI Mulyorejo kampus C Unair Surabaya, Indonesia, ³Doctoral Student, Faculty of Public Health, Universitas Airlangga Surabaya, JI Mulyorejo Kampus C Unair Surabaya, Indonesia; Faculty of Medicine, University of Muhammadiyah Malang, Jl. Bendungan Sutami 188, ⁴Doctoral Student, Faculty of Public Health, Universitas Airlangga Surabaya, JI Mulyorejo Kampus C Unair Surabaya, Indonesia; Study Program of Nursing Science, Faculty of Medicine, University of Brawijaya, Jl. Veteran Malang

Abstract

Background: The family medicine practice is a model for delivery of health care to the entire population, enhancing a patient focused and integrated primary health care systems. Unlike other medical specialties, family medicine practice includes biological, psychological, socio-spiritual, and all disease entities. Although considerable researches have been devoted to explain the concept of family medicine, rather less attention has been paid to its practice in developing countries. This study aims to review the empirical literature on a holistic-comprehensive care model implemented in family medicine practice particularly in developing countries.

Method: This study reviews alternative approaches to understand what “best practice” in family medicine is. The authors searched ‘family medicine practice’, or ‘family medicine’, ‘primary health care’ and ‘developing countries’ and ‘holistic’, and ‘comprehensive’ in address field from Google Scholars, Proquest and ScienceDirect dating from 2003 to 2019. Sixteen articles were included in the study out of 171 articles reviewed.

Result: A holistic-comprehensive care model consists of four primary concepts of care: clinical care, professional behavior in clinical practice, family medicine practice management and clinical practice facilities and equipment.

Discussion and Conclusion: The future studies of family medicine practice could focus on the promotion of a more sustainable delivery of healthcare. This study concludes by synthesizing concepts for a new family medicine practice, and suggests how a holistic-comprehensive model might contribute to thinking about the future of family medicine practice in developing countries.

Keywords: Family Medicine, Family Medicine Practice, Developing Countries, Holistic-Comprehensive Care Model, Review

Introduction

The family medicine practice is a model for delivery of health care to the entire population, enhancing a patient focused and integrated primary health care systems. Unlike other medical specialties, family medicine practice includes biological, psychological, socio-spiritual, and all disease entities. Most primary health care in developing countries are provided by health care
team include doctors and nurses but still small number of qualified doctors who are willing to work in rural areas, not as much as in developed countries. While the variety of people concentrated in urban areas, family doctors and health facilities are heavily concentrated in big cities. Currently in Africa, there is about one family physician for every 50,000 people in the country. However, in rural areas, often interventions are conducted by nurses or other clinical support services rather than family physician. As we can see that health systems struggle to adequately prepare health professionals to practice more in rural areas. In the countries such as South Africa, Nigeria, Uganda, the Democratic Republic of the Congo, Sudan, Ghana, Tanzania, Kenya, Lesotho, and Botswana, and most recently in Somaliland, Ethiopia, Mali, and Malawi, currently they are preparing for family medicine training program to support the needs of family physician in rural areas. Other issue that also needs to be addressed is “preventive care” as the first priority for family medicine practice. As the number of patients with chronic conditions arise, providing preventive treatment, such as lifestyle modification and coping skills have been identified as factors that could reduce future complications. Family physician should overcome the challenges to understand the biological, psychological, social, spiritual and cultural dimensions of health and diseases. Family doctors provide more primary care services than any other medical specialty and it is considered as the best choice of doctors. \cite{1-3}

A holistic-comprehensive approach was developed to provide promotive, preventive, curative and rehabilitative treatment. In holistic approach, family doctors should consider psychosocial aspects, culture, spiritual and beliefs. In addition, comprehensive care is a challenge for family doctors to provide a broad range of health services in and their appropriate provision types of patient needs. Through comprehensive care, patients receive a continuum of health services: promotion, prevention, treatment and rehabilitation within the collaboration with health insurance system. \cite{4-6}

Although considerable researches have been devoted to explain the concept of family medicine, rather less attention has been paid to its practice in developing countries. Primary health care should consider ways to ensure that community receive their priority health needs which are more affordable, accessible and available. \cite{7} This study aims to review the empirical literature on a holistic-comprehensive care model implemented in family medicine practice particularly in developing countries.

**Material and Method**

This study reviews alternative approaches to understand what “best practice” in family medicine is. More specifically, the paper explores how a holistic-comprehensive care model contributes to a more sustainable health care and patients’ wellbeing. The authors searched ‘family medicine practice’, or ‘family medicine’, ‘primary health care’ and ‘developing countries’ and ‘holistic’, and ‘comprehensive’ in address field from Google Scholars, Proquest and ScienceDirect dating from 2003 to 2019. The inclusion criteria employed were: 1) Review articles included in this study come in the forms of research articles, editorials, comments, literature reviews in quantitative, qualitative or mixed-method research. The study results might include papers in which family medicine practice applied in other countries exploring holistic-comprehensive care; 2) Papers must be written in English. These review papers were manually screened out by authors with previous experience of family medicine practice. A total number of 16 articles were identified.

**Findings**

A holistic-comprehensive model consists of four primary concepts of care based on four standards of family medicine practice: 1) clinical care (holistic care, comprehensive care); 2) professional behavior in clinical practice (doctor-patient relationship, partners in the healthcare team, working with colleagues, knowledge-skill development, community leader); 3) family medicine practice management (human resources, financial management, clinical practice management); and 4) clinical practice facilities and equipment (clinical practice facilities, clinical practice equipment, clinical support services). \cite{8}

Holistic care considers patient as whole human being: physical, emotional, social and spiritual aspects. \cite{4-5} In addition to treating all diseases, primary doctors provide alternative therapies using local resources which are integrated in the primary health services and delivered continuity of care. \cite{9-14} In a comprehensive care, doctors must provide primary care to the entire population, all ages and sexes, promote health, prevent illness, do the early screening, treat diseases, perform medical-social rehabilitation and improve family social function. \cite{15-17}

Several strategies to maintain family doctors’ professionalism through doctor-patient relationship: providing comprehensive health information, managing
effective and efficient length of consultation, delivering effective communication, and respecting rules and obligations between doctor-patient. A strong partnership in health care team has the potential to help support patients by improving professional relationship and teamwork clinic leadership. While working with colleagues, family doctors build their interprofessional relationships, relationship with other doctors and family doctors’ association.18-21

To support a lifelong learning for family doctors when providing holistic and comprehensive care, it is important to engage them in a continuing medical education, participate in advancing medical education, and collaborate in research and scientific writing. Quality assurance programs are essential to maintain high quality of care by constantly measuring the effectiveness of the family doctors’ organizations that provide it. As a community leader, doctors engage in social group association, participate in health and society program, as well as encourage communities in disaster program.22-30 Properly implementing quality improvement of family medicine is a key to a well-functioning practice.

A multidisciplinary health care team comprises people with wide ranging-skills: family doctors, nurses, midwifery and clinical administrator. In addition, doctors have a responsibility to be in charge of clinical examination fees, and maximize the benefits for their patients regarding use of alternative resources from health-care systems. Managing a comprehensive clinical practice efficiently requires evaluation and planning of staff and occupational health and safety procedures. Further, clinical practice facilities and equipment must be prepared to the most up-to-date and standardized medical and non-medical equipment to ensure health care team is able to provide the highest standards of clinical and patient care.31-32 Family doctors have a professional and legal duty to respect patient’s privacy and confidentiality with regards to their medical information, and manage the records appropriately as standards of continuity of care. Applying both conventional and local or alternative resources, family doctors delivered both basic medical care and common health services at a low cost.33 Good quality of a holistic and comprehensive in family medicine practice is essential to the proper ongoing care of patients.

Conclusion

The future studies of family medicine practice could focus on the promotion of a more sustainable delivery of healthcare. This study concludes by synthesizing concepts for a new family medicine practice, and suggests how a holistic-comprehensive model might contribute to thinking about the future of family medicine practice in developing countries.

Current Status and Awareness of Dental Trauma in B Region in Age of 20s

Sun-Mi Lee¹, Min-Ji Kim²

¹Department Dental Hygiene, Baekseok University, Cheonan, Korea, ²Department of Dental Hygiene, Dongseo University, Busan 47011, South Korea

Abstract

Trauma is a factor that can affect treatment, including ages, type and extent of injury, and elapsed time before post-traumatic treatment. The purpose of this study is to investigate the status of oral trauma and the level of oral trauma awareness to increase oral trauma education with 456 ordinary citizens living in Busan. The survey was conducted with the following results:

148 (33.6%) of them had a traumatic experience, and 105 (71%) of them had trauma in childhood and 93 (62.8%) had front teeth trauma which was the highest. In the recognition level according to the educational status, 35 people (47.3%) answered ‘correctly’ to the question of discrimination between milk tooth and permanent tooth (p=0.020).

The state of trauma was relatively high and the oral trauma education was significantly lower. The level of cognition differs significantly between the educated and uneducated groups, which suggests that more education and educational materials on how to cope with oral trauma and how to behave are needed.

Keywords: Dental Trauma, current status, awareness.

Introduction

Dental trauma is one of the accidents that can be experienced in daily life, sports and leisure¹). Even though modern people are frequently injured, they are not aware of the necessity of appropriate treatment and hence, the teeth that can be preserved due to delayed post-traumatic treatment are damaged and left unattended²). In particular, juvenile adolescence is a period of rapid growth and very active, and the risk of dental trauma is higher than ever³). However, the importance of dental trauma in oral health education in children and adolescents has not been highlighted. Over the years, dental trauma has gradually increased and the incidence of dental caries and periodontal disease in children and adolescents is expected to increase⁴). Traumatic teeth are classified into WHO classification into odontoclasis (fracture) and displacement damage. Odontoclasis injuries are largely classified into crown fractures that are exposed outside the gums, root fractures inside the gums, and crown fractures where the fracture line invades both sites. Displacement injuries are damages in which teeth are separated from the alveolar without fracture lines, such as shaking, subluxation, dislocation, fixation, and infiltration⁵). The main causes were reported by the Ministry of Health and Welfare as falling, exercising/playing, fighting and traffic accidents⁶). According to the 2003, 2006 and 2010 National Oral Health Survey of the Ministry of Health and Welfare, the proportion of patients with maxillofacial trauma was 9.42% (male 11.89%, female 6.96%) in 2003, 16.4% (male 22.4%, female 10.7%) in 2006 and 18.19% (male 20.41%, female 15.73%) in 2010 survey which have been increasing in recent years⁶-⁸), compared to those who experienced traumatic facial injuries⁹). Trauma is a factor that can affect treatment, including ages, type and extent of injury, and elapsed time before post-traumatic...
treatment. Although it is necessary, there is a lack of public awareness and education data on prevention and coping method for dental trauma compared to educational materials on two major oral diseases such as dental caries and periodontal disease. Accordingly, this study is to identify the level of trauma and perception of citizens in Busan in the age of 20s, and present the necessity and education on how to deal with trauma through trauma survey.

Material and Method

Research Subject: The survey was conducted on residents in their 20s in the B region, and 456 in their 20s responded to the survey. A total of 456 survey copies were collected, of which 441 were statistically included, except for 15 that were inaccurately answered.

Research Method: The questionnaire was distributed and self-written to answer the survey. First, a preliminary questionnaire was conducted to 30 subjects, and the incomplete contents were corrected and supplemented, and the final survey was conducted. The survey was conducted from October 16 to November 20, 2018.

Survey tool: The questionnaire was revised and supplemented according to Lee’s(10) questionnaire, and the questionnaire was divided into the level of dental trauma experience and the recognition level of first aid. A total of 8 questions were examined in which items related to the actual condition of traumatic experiences: the presence of the experience, the timing of the experience, the site of the trauma, the cause of the trauma, the location of the trauma, the presence of a companion in case of trauma, the first aid to deal with the trauma, and the change in interest in the oral cavity after trauma. For the recognition level of first aid, the knowledge level of first aid and prevention incidence of trauma was investigated through a questionnaire asking how to deal with the situation of dental trauma.

Analysis method: In order to examine the general characteristics of the respondents and their trauma status, the chi-square test was used for the frequency analysis and the recognition level according to the presence or absence of education. The significance level was p-value=0.05. The statistical program used for the study analysis was SPSS 22.0 (IBM SPSS Statistics).

Research Results

General characteristics of the subjects: The general characteristics of the subjects were 278 males (63%) and 163 females (37%). The ages were 289 (65.5%) for 20-22 years old, 114 (25.9%) for 23-24 years old, 32 (7.3%) for 25-27 years old, and 6 (1.4%) for 28-29 years old. Occupations were distributed in the order of 420 students (95.2%), 6 civil servants (1.4%), 4 self-employed workers (0.9%), 3 employees (0.7%), and 8 others (1.8%) (Table 1).

Dental Trauma of subjects: 148 (33.6%) had a dental trauma and 293 (66.4%) had no trauma. Trauma teeth were the highest in 93 (62.8%) respondents, followed by 49 molars (33.1%), 5 gums (3.4%), and 1 jaw (0.7%). The most common cause of trauma was collision with objects with 59 people (39.3%), followed by 41 hard foods (27.7%), 15 fights (10.1%), 12 sports injuries (8.1%), 3 traffic accidents (2.0%), and 18 others (12.2%) (Table 2).

Tooth Trauma Awareness Survey: In the questionnaire about tooth fractures of 8-year-old girls, 161 (36.5%) correctly answered that they were permanent teeth, and 280 (63.5%) answered that they were milk tooth. In addition, 269 (61.0%) of cognitive, 172 (39.0%) of erroneous. In the questionnaire on appropriate measures for dislocation of 11-year-old boys, 371 (84.1%) were cognitive whereas 70 (15.6%) were erroneous (Table 3).

Investigation of transport and cleaning solutions for dislocated teeth: The following cleaning solutions were used when the tooth was completely dislocated: 145 (32.9%) with the saline solution, 114 (25.9%) used milk, and 83 (18.8%) used tap water. The transport solution for dislocated tooth was as follows: 167 (37.9%) carried milk, 103 (23.4%) carried saline and 63 (14.3%) carried tap water (Table 4).

Table 4: Transport and cleaning solution for dislocated teeth Sort N(%)
Investigating the awareness of the need for prevention and treatment of dental injuries: 376 (85.3%) people thought they needed to receive professional education on the prevention and treatment of dental trauma, and 65 (14.7%) thought they do not need it (Table 5).

*Chi-square test

Consideration

The most representative oral diseases of oral lesions are dental caries and periodontal disease\textsuperscript{11). Modern people often have access to dental caries and periodontal diseases through education, media, and practical experience. In addition, dental caries and periodontal diseases is a bilateral oral disease designated by the WHO, and people’s attention is focused on this possibility\textsuperscript{12-13). Therefore, this study investigates the current state of dental trauma and the level of first aid for dental trauma to identify the level of perception and to contribute to the preparation of education to the improvement of oral health level.

Among the age of 20s respondents in Busan, 357 (80.9%) answered that dental health affects their lives, and 74 (16.8%) have experienced education on dental trauma.

According to the dental trauma survey, 148 (33.6%) of 441 respondents have experienced ‘tooth trauma’, indicating that dental trauma is frequently occurring of the 148 respondents (33.6%) who received a dental trauma, only 79 (53.4%) went directly to the dentist and 45 respondents (30.4%). Therefore, first aid and oral health education should be provided for dental trauma. The time of trauma was 105 patients (71%) who had the largest number of dental trauma in childhood and 42 respondents (28.4%) answered the most common sites was in schools which showed similar results to the studies of Lee\textsuperscript{10) and Park\textsuperscript{14). This proves the need for early education on dental trauma. Among the trauma victims, 93 (62.8%) experienced the most trauma to their incisors, 59 people (39.3%) had a colliding with the object accidents which was the most common cause, and according to the report, 47% of anterior crown fractures occur most frequent\textsuperscript{15-18).}

There was also a significant difference in the comparison of the group with and without the education of dental trauma (p=0.020). In case of complete dislocated teeth, immediate replanting is ideal, but if it is not feasible, efforts should be made to minimize damage to the periodontal ligament of the damaged tooth\textsuperscript{19-20). However, only 140 (31.7%) respondents said they would replant, and only 34 (7.7%) responded
correctly to pre-plant treatment, saying that they took no action on their teeth. Ideally, fully dislocated teeth should be replanted within 30 minutes\(^{20}\), with 364 respondents (82.6%) were aware of the correct planting time. Lastly, 376 respondents (85.3%) thought that ‘the need for professional education on the prevention and treatment of dental trauma’ was high. Although it was found necessary, the educated group was more aware of the need for education (\(p=0.034\)).

As a result of analyzing the survey responses of age of 20s in Busan region, this survey lacked accurate information due to lack of oral knowledge and lack of surveyors to understand the purpose of each survey. In the future, a survey should be made to supplement these problems, and if appropriate education and educational materials on dental trauma are provided, the prevention of dental trauma and the flexible responses after trauma will help to preserve the teeth and improve the oral health level of the public which seems to be a significant contribution.

**Conclusions**

The purpose of this study is to investigate the status of oral trauma and the level of oral trauma awareness to increase oral trauma education with 456 ordinary citizens living in Busan. The survey was conducted with the following results:

1. The proportion of respondents with an education experience was significantly lower, with 74 (16.8%) and 357 (80.9%) responding that teeth affected their lives.

2. 148 (33.6%) of them had a traumatic experience, and 105 (71%) of them had trauma in childhood and 93 (62.8%) had front teeth trauma which was the highest.

3. In the case of carrying out and cleaning of teeth due to dental trauma, 167 (37.9%) responded milk for cleaning and 145 (32.9%) responded saline for carrying.

4. In the recognition level according to the educational status, 35 people (47.3%) answered ‘correctly’ to the question of discrimination between milk tooth and permanent tooth (\(p=0.020\)).

5. There was a significant difference on the awareness level according to the presence or absence of education on replanting recognition with complete dislocation teeth, 37 (50%) respondents had been educated where 103 (23.4%) did not have education (\(p<0.001\)).

6. There was a significant difference in the level of awareness depending on the presence or absence of education in the treatment except for the replanting of complete dislocation teeth, 37 (50%) were educated and 95 (25.9%) were not educated (\(p<0.001\)).

The state of trauma was relatively high and the oral trauma education was significantly lower. The level of cognition differs significantly between the educated and uneducated groups, which suggests that more education and educational materials on how to cope with oral trauma and how to behave are needed.

Relationship between Satisfaction with Nurse Work Performance in Health Services in Hospitals

Suprapto
Nursing Academy of Sandi Karsa Makassar, South Sulawesi Indonesia

Abstract
Background of the current era of globalization suggests that market mechanisms will be increasingly dominated by business organizations that provide services or produce superior products that have good competitiveness and take advantage of market opportunities. Providing quality service is inseparable from human resources that produce good performance and achievement. One of the factors that correlates nurses’ performance or work performance is the lack of a person’s satisfaction with their work. Method descriptive analytic research with cross sectional approach. Information and data in this study were collected through a questionnaire on all nurses who worked at the hospital. After the data is obtained then an analysis is carried out to find whether there is a relationship between job satisfaction and the work performance of implementing nurses. Results, show that nurses who have good job satisfaction are 15 people (57.7%), showing good job performance. This shows that nurses who have good job satisfaction will have the desire to provide more energy and responsibility in supporting the success and welfare of the hospital. Multivariate analysis shows that the independent variables are related to the dependent variable. The results of the analysis obtained job satisfaction of 0.50 then it can be stated to have a significant relationship to work performance. Conclusion there is a relationship between satisfaction with nurse work performance. There is a significant relationship between job satisfaction with work performance working in a hospital treatment room. In providing good and quality health services, both in terms of service, care and also good facilities for patients. Job satisfaction is proven to provide a relatively good relationship to the improvement of work performance, it also does not rule out the possibility for companies to consider other factors that can provide convenience in the field of health services.

Keywords: Satisfaction, Achievement, Nurse.

Introduction
The current era of globalization suggests that market mechanisms will be increasingly dominated by business organizations that provide services or produce superior products that have good competitiveness and take advantage of market opportunities. Providing quality service is inseparable from human resources that produce good performance and achievement. Job performance is something that is done or a product or service produced by a person or group, how the quality of work, accuracy and neatness of the work, assignments and fields of work, use and maintenance of equipment, initiative and creativity, discipline, and work spirit (honesty, loyalty, a sense of oneness and responsibility and interpersonal relationships).

Employee performance appraisal is included in one of the activities of human resource development (Human Resources Development) in every company organization, both in service industry organizations and in the manufacturing industry. Human resources, which are also a factor of production, are never free from appreciation, either because of their ability to do any work, or because of their work achievements in the form of promotion, promotion, salary increase, incentives and so forth. Giving awards, besides rewarding for an

achievement, it is also a motivation for employees who have not performed well, so that in the future, their achievements can be improved.

Job satisfaction can be identified as an accumulation of the results of interactions that occur continuously between the person and the work and environment where he works in a certain period of time. Therefore, job characteristics and organizational climate are factors that are very closely related to job satisfaction and commitment and will ultimately have an impact on work performance or achievement.

Lack of individual factors (commitment, motivation, and work ethic) and organizational factors (compensation, human resource development, leadership, supervision, and working conditions) will relate to nurse performance as measured by measuring RATER (Reliability; Assurance, Tangible, Emphaty, Responsiveness) which is an indicator of nurse performance that will directly relate to hospital performance.

Job Satisfaction: The first person provides an understanding of the concept of job satisfaction. They assume that job satisfaction can be suspected from a person’s attitude towards his job. Job satisfaction depends on what a person wants from his job and what is obtained. The people who are least satisfied are those who have the most desires, but get the least. While the most satisfied are people who want a lot and get it.

At the most basic mind, job satisfaction is a positive emotional state from evaluating one’s work experience. Dissatisfaction arises when these expectations are not met. Job satisfaction has many dimensions. In general, the observed stages are satisfaction in the work itself, salary, recognition, the relationship between supervisors and workforce, and opportunities for advancement. Each dimension produces feelings that are satisfied overall with the work itself, but work also has a different definition for others.

Work Performance: Job performance is also called performance or in English it is called performance. In principle, there is another term that better describes achievement in English, the word “achievement”. But because the word comes from the word “to achieve” which means to achieve, then in Indonesian it is often interpreted as achievement or what is achieved. Based on the understanding of work performance is the result of one’s work, we need a system of measuring work performance or what is called work performance appraisal. Almost all ways of measuring work performance take into account quantity, quality and timeliness.

Job performance shows the work achieved by someone. said that work performance is a result of work achieved by a person in carrying out the tasks assigned to him based on skill, experience, and earnestness of time. In other words that tangible work performance in a situation achieved by employees with better results increases than before.

Performance appraisals are carried out to obtain information that is useful in decision making related to other human resource management (HR) activities, such as planning and career development, compensation programs, promotions, transfers, pensions, and dissmissals. Performance appraisal in the context of the development of human resources is very important. This reminds us that in organizational life we want to get respect and fair treatment from the leaders of the organizations concerned. In the life of an organization there are several assumptions about human behavior as human resources that underlie the importance of assessing work performance.

Nurse: A nurse is someone who has completed a nursing education program both domestically and abroad that is recognized by the Government of the Republic of Indonesia, is registered and given the authority to carry out nursing practice in accordance with statutory regulations.

Nursing is one of the professions in hospitals that plays an important role in the implementation of efforts to maintain the quality of health services in hospitals. The standard on evaluation and quality control explains that nursing services guarantee high quality nursing care by continually engaging in quality control programs in hospitals. The role of nurses is very important because as the spearhead of good or not the quality of health services provided to patients. Nurses are one of the professions in the hospital with the most dominant number and the longest contact or contact (interact) with patients in inpatient services for 24 hours.

Materials and Methods

The research design is analytic descriptive research with cross sectional approach. Information and data in this study were collected through a questionnaire on nurses working in hospitals. Human resources, which are also
a factor of production, are never free from appreciation, either because of their ability to do any work, or because of their work achievements in the form of promotion, promotion, salary increase, incentives and so forth. The awarding, besides rewarding for an achievement, is at the same time a motivation for employees who have not performed well, so that in the future, their achievements can be improved. Job satisfaction can be identified as the accumulation of the results of interactions that occur continuously between the person with the work and the environment in which he works in a certain period of time. Job characteristics, and organizational climate are factors that are very closely related to job satisfaction and will ultimately have an impact on job performance or performance 12 14.

Discussion

Distribution of respondents based on job satisfaction of nurses implementing in treatment room II shows the number of respondents 15 people (57.7%) who have good work performance. This shows that nurses have loyalty and feel attracted to the values, goals and objectives of the hospital where they work. The discovery of 5 people (19.2%) of respondents had less job satisfaction. This shows that nurses and hospitals lack the same goals, values and targets or nurses do not want to involve themselves more closely with hospitals. Based on the results of bivariate analysis, it showed that nurses who had good job satisfaction 15 people (57.7%), showed good work performance. This shows that nurses who have good job satisfaction will have the desire to provide more energy and responsibility, in supporting the success and welfare of the hospital.

Nurses who have good job satisfaction will have little reason to leave the hospital for a long time. This job satisfaction will have an impact on nurse performance, where the better job satisfaction is, the better work performance. This is evident through the willingness to work beyond what is expected so that the hospital can develop. Primary data shows that most nurses feel that working at the hospital is their best choice in making decisions about the workplace. The similarity of values and goals between nurses and the hospital allows no difficulties experienced by the implementing nurse in every decision determined. from the hospital. Executing nurses who lack job satisfaction will have underachievement because the effort or the resulting performance is not optimal due to the lack of a sense of shared interest in the hospital 15 16.

Beta value is the value indicating the independent variable associated with the dependent variable. The results of the analysis obtained job satisfaction of 0.50 then it can be stated to have a significant relationship to work performance.

Conclusion

Based on the results of research on the relationship of job satisfaction with the work performance of implementing nurses in hospital treatment rooms; There is a relationship between job satisfaction and work performance of nurses in hospital treatment rooms. There is a significant relationship between nurse job satisfaction with work performance in hospital treatment rooms. In providing good and quality health services, both in terms of service, care and also good facilities for patients, the company must maintain employee work performance.

Introduction

The urogenital schistosomiasis (UGS) is extremely widespread around the world, taking the second position after malaria. Out of 243 million people with the proved UGS, more than a half of the cases are caused by infection of Schistosoma haematobium (SH), – the parasite, that lives in water sources on the territory of Africa and the Middle East countries: he gets into bodies of an urinogenital system of the person with infection, that leads to development of a disease.

The chronical effect of SH eggs on tissue of an urothelium causes the development of the specific schistosoma-associated bladder cancer (SA-BC), that is considered as “squamous cell carcinoma of the bladder” by pathologists in most cases. The data of world scientific literature demonstrate that SA-BC is often diagnosed in the neglected disease stages, with a low stage of a differentiation of a tumor.

The treatment conditions of the population living in the provinces with SA-bladder cancer are significantly different from those of urban residents. At the same time, residents of small towns and rural areas make up 55.18% of the total population of Angola. The results of medical care in bladder cancer are determined not only by the causes of the ecological, geographical, social and domestic plan, but to a considerable degree by medical and organizational factors. Unfortunately, specialized medical algorithm and postoperative care for many patients with SA-BC are not available. Study of the

Abstract

Background and Purpose: The aim of the study was to improve the diagnostic and treatment approach in the provision of medical care for patients with Schistosoma-associated bladder cancer (SA-BC).

Material and Method: The survey results of 56 patients with gross hematuria in medical institutions of the province Benguela (Angola) since 2007 to 2012 has been studied. Group A (n=35) included patients before applying the standardized diagnostic algorithm. Group B (n=21) included patients using the new organizational format, which included using hospital outpatient care structures.

Results: The progression to locally advanced stage of SA-BC was verified at significantly higher rate (80%). In patients from group A, while verified locally advanced SA-BC stays at low level (66,7%) in group B.

Conclusions: The combined usage of urine cytology test, ultrasonography and cystoscopy at the increased proliferative process caused by Schistosoma Hematobium (SH) allows to reveal diagnose SA-BC in early stages, subject to on condition of patients admission in hospital outpatient care structures of specialized medical institutions.

Keywords: Schistosoma haematobium, Schistosoma-associated bladder cancer, radical cystectomy, hospital outpatient care, short-term hospital.

Introduction

The urogenital schistosomiasis (UGS) is extremely widespread around the world, taking the second position after malaria. Out of 243 million people with the proved UGS, more than a half of the cases are caused by infection of Schistosoma haematobium (SH), – the parasite, that lives in water sources on the territory of Africa and the Middle East countries: he gets into bodies of an urinogenital system of the person with infection, that leads to development of a disease.

opportunities of improvement the quality of diagnostics and medical care in UGS patients, which are a risk factor for evolution of SA-BC, remains a relevant cross-disciplinary task.

**Background and Purpose:** The aim of the study was to improve the diagnostic and treatment approach of medical care for patients with Schistosoma-associated bladder cancer (SA-BC).

**Material and Method**

The survey results of 56 patients with gross hematuria attended in medical institutions of the province Benguela (Republic Angola) since 2007 to 2012. Most of the patients were from rural areas - 49 (87.5%), the number of citizens was 7 (12.5%). All patients participating in the study reported episodes of the use of crude fresh water in everyday life (drinking, cooking, washing, etc.). Patients are distributed in 2 groups A and B. Group A included 35 patients before applying the standardized diagnostic algorithm, (observation period from 2007 to 2009): 5 (14.3%) patients with tumor pathology not related to UGS and 30 (85.7%) SA-BC patients. Group B included 21 patients using the new organizational format (follow-up from 2009 to 2012): UGS and SA-BC was detected in 4 (19.1%) and in 14 (66.7%) cases respectively, 3 (14.3%) cases gross hematuria was not associated with UGS. All our diagnostic and therapeutic actions, including new ones, were approved by the members of the local ethics committee.

**Findings:** Observation results of A group patients (n=35; 19 women and 16 men, middle age 35.4±4.2 years) estimated retrospectively. The duration of hematuria in patients of this group ranged from 3 weeks to 12 months. The standard approach adopted in the region included treatment UGS patients in primary medical institutions, where a urologist was not always available. In case of unsuccessful treatment, the patient was sent to a specialized urological department, where the urologist appointed an examination including: standard monitoring of urine cytology, ultrasound examination of the abdominal cavity and lower pelvis, cystoscopy with an “random” biopsy (in the presence of changes of a wall of a bladder according to ultrasonography). The excretory urography and the computer tomography of abdominal organs, lower pelvis and urinary tract have been carried out according to indications. When a bladder tumor was detected, the patient was sent to the hospital for performing the surgical treatment.

In 5 (14.3%) cases, hematuria was not associated with UGS. We verified SA-BC after surgical treatment: a case (2.9%) of non-muscle-invasive SA-BC in stage pT1N0M0 (an open resection of the bladder), 28 (80%) cases of locally-spread SA-BC in stages pT3-4N0-3M0-1 (radical cystectomy with various types of urine derivation in 23 cases or an ureterocutaneostomy). One (2.9%) patient came to a hospital from a maternity home, at 37 weeks of pregnancy. Squamous-cell bladder cancer (BC) confirmed histologically in all cases, *Schistosoma* eggs were revealed.

There were 21 persons (13 women and 8 men at the age of 30±3.4 years) in group B, with gross hematuria lasting from 1 week up to 2 months. The plan of observation has been corrected: patients with the first time revealed gross hematuria have been directed to the urologist of the short-term hospital (STH), the structural division of regional level hospital. Standard examination was supplemented by obligatory cystoscopy and/or transurethral resection of the bladder wall (TURB) all of patients UGS. The organization of specialized observation of the patient in STH of regional hospital, with participation of the qualified doctor-urologist is an advantage of this method.

In 3 (14.3%) cases, hematuria was not associated with UGS. An severe proliferative changes of a wall of a bladder caused by UGS have been verified at 4 patients (19.04%) and TURB was executed. UGS confirmed by results of a histologic research – schistosoma eggs were found in the biopsy specimen, malignant cells were not found. The diagnosis established as “SA-BC pT1-2N0M0” at 14 patients (66.7%): TURB has been carried out to 5 patients, an partial cystectomy has been executed to 9 patients (including three pregnant women in the third trimester of pregnancy).

The existence of schistosoma eggs confirmed in 28.2% of cases during urine test. Specific changes for SA-BC and UGS, by results of ultrasonography and cystoscopy, revealed in all cases: it has been proliferative exophytic formations of a bladder (the size> of 1.5 cm). The combination of beam and endoscopic method has allowed to diagnose a disease for patients of B group and define indications for endoscopic (TURB) or open surgical interventions.

Indicators of the general status of SA-BC lesions (Karnowsky scale and ECOG Performance Status) has not differ significantly: all patients are at working-age,
with a minimum list of associated diseases. Therefore, the general status of patients is not defining for choosing a method of treatment: Karnowsky index was 90 ± 8.5 and 80 ± 4.7, respectively, and the ECOG index –0-1 and 1-3 (p > 0.05) at the patients transferred endoscopic treatment or cystectomies. Duration of hospital staying of patients, taking to account the choice of organ-preserving operation is in the Table 1.

Table 1. Duration of stationary stay of patients with SA-BC

<table>
<thead>
<tr>
<th>Operation option</th>
<th>Number of SA-BC cases</th>
<th>Duration of hospital stay (days)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TURB</td>
<td>5</td>
<td>4.3±1.5</td>
</tr>
<tr>
<td>Open operations</td>
<td>10</td>
<td>18±2.1</td>
</tr>
<tr>
<td>Probability</td>
<td></td>
<td>&lt;0.01</td>
</tr>
</tbody>
</table>

Indications of duration for hospitalization at SA-BC lesions have been significantly less after TURB, comparing with indications after “open” operations, that corresponds to results of similar researches in this direction. The nature of an operative intervention has been lower after organ-preserving interventions (Tab. 2).

Table 2. Duration of hospital stay of patients, depending on the volume of the performed operation

<table>
<thead>
<tr>
<th>Operation option</th>
<th>Number of SA-BC cases</th>
<th>Duration of hospital stay (days)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TURB</td>
<td>1</td>
<td>4.3±1.5</td>
</tr>
<tr>
<td>Partial resection of the bladder</td>
<td>2</td>
<td>17.5±2.1</td>
</tr>
<tr>
<td>Radical cystectomy</td>
<td>23</td>
<td>31.6±2.3</td>
</tr>
</tbody>
</table>

The duration of the bed stay has been lower at patients of B group after organ-preserving operations, comparing with similar measure for A group (Tab. 2). Probably, it is explained by usage of endoscopic surgery in STH, reduction of time expenditure by carrying out primary diagnostics and centralization of medical care in STH of a regional hospital.

Average duration of bed stay at patients after performance of radical surgical treatment (radical cystectomy) has been lower (for 9.5 bed days) after usage of a Mainz Pouch II technique.

Discussion

According to A.M. Bronstein et al., gross hematuria indicates on UGS infection, and also as one of early clinical manifestations of a malignant new growth. Microscopic detection of SH eggs remains “the gold standard” for diagnostics of UGS in concentrated urine by centrifugal ultrafiltration method. However, this method as well as modern diagnostic method (PCR, molecular markers for SH verification etc.) require qualified laboratory specialists.

Complex diagnostics of early lesions of an urothelium at UGS with usage of beam and endoscopic method allows to verify SA-BC promptly in at patients of young age that has important social value. Cystoscopic picture of UGS is very specific. Inflammatory, polyp-like and erythematic bilharzial lesions most often are located in the field of a dome and on a bladder sidewall, and specific “sandy patches” of an urothelium – around a neck of a bladder and ureteral isthmus. The “random” biopsy of chronic ulcers of a bladder conducts after light cystoscopy, which coagulate or resect during a transurethral resection. Conducting the TURB allows to reduce expressiveness of the irritable symptoms and to stop a gross hematuria. Malignant regeneration of an urothelium at UGS often appears in a late stage at which as method of the choice serves only operation – a radical cystectomy.

The frequency of verification of bladder malignant damages in a locally-spread stage in B group has been significantly higher, than in A group, that is reflection of opportunities of active medical and diagnostic tactics. It has allowed to execute only organ-preserving operations by all patients of B group, thereby having improved the forecast and the further prospects of treatment of these patients. The combined usage of urine cytology, ultrasonography and cystoscopy at the expressed proliferative process caused by UGS allows to reveal SA-BC in early stages, subject to patients admission in STH of specialized medical institutions.

We have used the recommendations of the European association of urologists (EAU) for development of uniform indications to performance of TURB, according to which operation is admissible in cases:

1. Endovesical proliferative inflammatory formations.
2. Ulcerous lesions (performance of coagulation and a biopsy is allowed).
3. Tumor new growth (without through perforation of a wall of a bladder, in cases of the planned radical cystectomy).
4. “Sandy patches” can be subjected only to a biopsy.
The usage of endoscopic surgical interventions is applicable at identification of proliferative changes of an urothelium at UGS lesions, taking into account reliable decrease in number of complications and duration of patients staying in a hospital is expedient. The usage of endoscopic surgery at UGS defeated and at patients with early stages of SA-BC allows to verify most fully and low-invasive localization and volume of damage of a bladder that promotes the maintaining quality of patients’ life. Minimization of complications of the postoperative period after low-invasive interventions allows avoiding performance of “open” operative measures.

The quantity of complications at endoscopic operations at SA-BC lesions is defined by surgeon’s experience and, in a small number of cases, depends on a stage and the sizes of a new lesion. Endoscopic urological equipment of the day hospital base located in an endemic zone of Schistosoma – is an important component of work of a urological hospital which employees provide medical care by the patient from the confirmed urinary system invasion of SH.

According to the accepted indications, the medical and diagnostic algorithm used on the basis of STH (Fig. 1) is created.

In our opinion, the medical and diagnostic actions can be conditionally divided into three stages for optimization of identification of cases of SA-BC:

- **Pre-hospital inspection.** Taking into account residence of most of patients in remote areas, the organization of laboratory and functional inspections and medical examination by specialists in the adopted standard is carried out in municipal hospitals. The patient is conducted the specialized examination in STH of regional hospital at the emergence of a gross hematuria;

![Figure 1. The algorithm used at delivery of health care by UGS lesions and SA-BC on the basis of short-term hospital](image-url)
- hospital stage. Specialized medical care in urology departments of regional hospital;
- rehabilitation stage. Dynamic observation and dispensary control of SA-BC lesions in medical institution at the place of residence. The algorithm of delivery of health care at pre-hospital and hospital stages is represented for UGS and SA-BC defeated in Figure 2.

**Figure 2. Algorithm of delivery of health care for UGS and SA-BC lesions.**

**Conclusion**

The absence of due consideration to a problem of UGS and uniform tactics of observation and treatment of UGS lesions at all stages may become the reason of late detection of a bladder malignant tumors. Preventive oral treatment by the Praziquantel does not solve a problem of diagnosing of SA-BC in an early stage.

The continuous sorting of the patients with a gross hematuria living in endemic regions, consisting in redistribution of patients in the medical institutions
equipped with the necessary diagnostic equipment and the endoscopic operational equipment and also staffed with the qualified specialists urologists that will allow to diagnose and treat in due time proliferative changes of a urothelium is expedient.

The cytological analysis of urine sediment for detection of SH eggs is the most available diagnostic method, but it does not correspond to high diagnostic criteria. The medical and diagnostic algorithm at patients with UGS has to include carrying out cystoscopy and, according to indications, perform the TURB. The similar approach in treatment tactics of UGS allows to verify SA-BC in early stages. It improves the forecast of a disease, keeps high quality of life for the young able-bodied citizen and solves a problem of prevention of the development of complications in malignant tumor cases. Considering the probability of development of SA-BC during 10-15 from the moment of SH infection, stages of further observation and medical examination of this group of patients have to be standardized.

The improvement of diagnostic method of a tumor, in combination with modern medical approach at SA-BC lesions, plus introduction of observation system of patients at a stage of rehabilitation – will allow to make manageable of the oncological growth, caused by the development of an urinogenital schistosomiasis. Conducting the TURB allows to reduce expressiveness of the irritable symptoms and to stop a gross hematuria schistosomiasis.

Early Breastfeeding Practice in Padang, West Sumatera

Vetty Priscilla¹, Pratiwi Wulandari¹

¹Faculty of Nursing, Universitas Andalas, Padang, West Sumatera, Indonesia

Abstract

Background: Early breastfeeding practice has many opportunities not only for the baby itself but also for mother. By feeding the baby sooner after delivery has positive effect to sustainability for successfull exclusive breastfeeding.

Objective: The aim of the study was to obtain an overview of the implementation of early breastfeeding in the city of Padang.

Method: The type of research used is descriptive. Data collection was conducted from May to October 2018. Data was taken by purposive sampling with the number of respondents 213 postpartum mothers in the city of Padang. Data is analyzed univariately.

Results: It showed that the majority of respondents breastfed their babies within 1 day after giving birth which is 80% and within 1 hour after giving birth that is 14%, almost 100% of respondents gave colostrum to babies and more than half (53%) of respondents had motivation in early breastfeeding.

Conclusion: The success of early breastfeeding is due to the strong motivation of the mother to be able to carry it out.

Keywords: Early breastfeeding, Colostrum, Motivation.

Introduction

Breastfeeding is an action taken by the mother in giving mother’s milk (ASI) directly to the baby. Early breastfeeding means if the baby breastfed immediately right after born. The rate of early breastfeeding in Indonesia is only 51.9%, of which 42.7% is done in the first 1 hour of birth while 9.2% is more than one hour after birth¹. This figure is low compared to other developing countries and opposes Indonesia, such as Timor Leste (75%)(²).

It addressed that 3 out of 5 babies are not breastfed in the first 1 hour after a baby is born to occur in a developing country¹. Though breastfeeding in the first 1 hour after the baby is born is a critical period for the survival of the baby. If the baby is not breastfed in the first 1 hour after birth, it is likely that the mother not give high milk quality to the baby which has an impact on the baby’s health like susceptible to disease even to death. Likewise with mothers, by breastfeeding the baby, the mother will avoid various diseases that even end in death such as the risk of breast cancer.

Advantages of breastfeeding and early breastfeeding are not accompanied by high rates of breastfeeding. In the city of Padang, the exclusive ASI rate for 2017 is 72.5%. This figure decreased compared to 10 years ago, namely in 2010 where the coverage of Exclusive Breastfeeding was 84.8%(²). While the rate of early breastfeeding at 0 months is only 39.8% and decreased to 15.3% in the next five months. This description shows that the potential failure of breastfeeding is very large. Therefore, researchers want to get an idea of how early breastfeeding is carried out in the city of Padang.

Method

The methodology used in this study is descriptive with a total number of 213 respondents postpartum mothers who are in the area of Padang City. Data
retrieval is done by purposive sampling for 6 months starting from May-October 2018. Data was taken using a questionnaire. The data that has been collected analyzed by univariate analysis.

**Result**

**Table 1. Responden’s Characteristic in Early Breastfeeding Practice in Padang**

Table 4 shows that more than half (53%) of respondents have internal motivation in early breastfeeding practice compare to those who were got external motivation for early breastfeeding practice.

**Discussion**

**Responden’s Characteristic in Early Breastfeeding Practice in Padang**: The result of this study shows that most of the respondents (85%) were in the age range of 20-35 years, higher education (79%), have jobs that make money (67%) and had multipara obstetric status (69%). The status of primipara, and the low level of education are associated as a factor that causes breastfeeding problems.

**Early Breastfeeding Practice in Padang**: Table 2 above shows that the majority of respondents breastfeed their babies within 1 day after giving birth which is 80% and within 1 hour after giving birth which is 14%. The percentage of respondents who breastfeed their first baby after 1 hour gave birth was greater than the percentage of early breastfeeding for less than 1 hour of delivery. Though the success of breastfeeding within 1 hour after the baby born has the potential for the success of subsequent breastfeeding.

Breastfeeding within 1 hour after the baby born in the delivery room. All respondents taken in this study gave birth to vaginal delivery. Skin to skin contact between mother and baby occurs at this time because the baby feeds directly on the mother after birth. Skin-to-skin contact that occurs in the mother and baby while breastfeeding can prevent the baby from hypothermia. Skin to skin contact is very easy to implement and is an appropriate and affordable alternative technology action for everyone.

Breastfeeding provides an excellent opportunity to enhance a true symbiotic bond between mother and baby. If the mother succeed in breastfeeding the baby at this time and carried out routinely and maintained by the process, the success of the breastfeeding for mother is high.
The success of give breastfeeding after delivery is also related to mothers self efficacy which make mothers confidence about it. Factors related to mothers self efficacy are age and previous pregnant experience. Maternal age less than 20 years affects early breastfeeding. Mrs. Cendrung has not had a breastfeeding experience because at this age the mother is generally a primipara. The status of primipara especially those who are under 20 years old can result in the withdrawal of early breastfeeding to infants.

Almost all of primiparous mother were not ready to face the reality of breastfeed. Mothers had an idea that breastfeeding would be natural without difficulties. When problems occurred, they perceived this to breastfeeding problem and choose to give artificial milk.

The problem of breastfeeding often occurs early in the postpartum period because mother feels pain. This situation is more experienced by primipara, namely the mother who first gave birth. The impact of the mother tends to delay breastfeeding. Because breastfeeding increased cramping pain after delivery. The increase in cramping pain is most likely due to the breastfeeding-associated oxytocin surge increasing uterine tone.

Despite of that condition, in Ethiopia, breastfeeding is one strategy to reduce the high infant mortality rate. Breastfeeding is a very simple action and does not require a lot of money.

**Overview of Giving Colostrum for Newborns in Padang**: Table 3 above illustrates that almost 100% of respondents give baby colostrum. Babies get colostrum in early breastfeeding. Colostrum is the milk that first comes out of the mother’s breast and is yellow and thick. Duration of breastfeeding and administration of colostrum are closely related to IQ. Early breastfeeding can also prevent hypoglycemia in newborns and contribute 45% to the success of exclusive breastfeeding. Therefore, breastfeeding should be given as soon as the baby born.

**Post Partum Motivation on Early Breastfeeding Practice in Padang**: Table 4 illustrates that more than half (53%) of respondents have motivation in early breastfeeding. Motivation for mothers to breastfeed the babies should have been implanted since pregnancy. Implementation of early breastfeeding on one’s own desires because mothers know the advantages of breastfeeding. So that the mother can be motivated to breastfeed as soon as the baby born. Health education about breastfeeding, a positive attitude from the mother and a comfortable environment while breastfeeding is very important to note so that the mother is able to breastfeed the baby early. Providing information on breastfeeding must be in accordance with the needs of the mother.

Information can also be gained through social media and peer group support. Nowadays almost all of mothers use social media. Mothers are using online social support groups in their thousands to seek information from people in similar situations so that they can support and motivate each other. Support from other people can motivate mothers to breastfeed babies. Support provided can be in the form of teaching how to breastfeed properly, and controlling emotions while breastfeeding. Supporting the new breastfeeding mother should include facilitate the motherhood transition, learn to read the baby’s cues, developing the right attachment at the breast, and build up the mother’s confidence in her capability to care for the baby and produce milk.

Moreover, the problem of breastfeeding often occurs early in the postpartum period. Health workers as professional health workers must help mothers overcome breastfeeding problems at the beginning of the postpartum period, especially for first-time mothers and those who give birth at a young age. In addition, mothers who clarified their doubts and discussed their problems with health care provider and breastfeeding support networks were more likely to breastfeed for a longer duration compared to those who did not.

**Conclusions**

Early breastfeeding is important for postpartum mothers because it is very beneficial not only for babies but also mothers. The first milk that comes out is colostrum which contains a lot of antibodies. The implementation of early breastfeeding should be done in the first 1 hour after the baby is born because the baby’s suction reflex is strong. The success of early breastfeeding is due to the strong motivation of the mother to be able to carry it out.

Abstract

Peptic ulcer disease (PUD) results from an imbalance between stomach acid-pepsin and mucosal defense barriers. It affects 4 million people worldwide annually. The incidence of PUD has been estimated at around 1.5% to 3%. Purpose of our research is to study the effect of dalargin on the course of giant gastric ulcer (GU) and duodenal ulcer (DU). Materials and Method - The study and treatment was carried out in 80 people suffering from PU, with the presence of an ulcer defect ranging in size from 2 to 7 cm in diameter. Group 1 - 41 people received the drug from the group of proton pump inhibitors (PPIs) - omeprazole 20 mg 2 times per day + amoxicillin 500 mg 4 times per day + metronidazole 500 mg 3 times per day - 7 days, i.e. standard triple therapy. Group II, 39 people received along with standard therapy, dalargin-endonasal electrophoresis No. 12 according to the standard technique. Results - Patients with PU in both groups, who received standard therapy and standard therapy + endonasal electrophoresis of dalargin, already for 2-3 days from the moment of the start of treatment, showed significant improvement. Conclusion - It is advisable to combine standard therapy in the treatment of giant ulcers with the use of reparants, in particular, with dalargin endonasal electrophoresis

Keywords: Peptic ulcer diseases, Giant ulcer, Gastric ulcer, duodenal ulcer, Dalargin, Gastroenterology.

Introduction

The problem of complete cure for peptic ulcer (PU) still remains today. Undoubtedly, Helicobacter pylori infection (Hp) is one of the leading factors in the onset of peptic ulcer, and its presence leads to an increase in proliferative processes in the gastric mucosa, supports chronization of the process, occasionally creating a risk of relapse. Therefore, the main task is to eradicate Hp. The presence of “triple” and “quadratherapy” for the successful eradication of Hp (according to the Maastricht Consensus 2000), can significantly reduce the frequency of recurrences and, accordingly, increase the remission period [1,5,6,7]. Recently, a number of features have been noted during peptic ulcer, in particular, change in the seasonality of the disease (for the first time and recurrence of the disease in 30% of cases are observed in the summer period, the latent forms of the disease have become more severe), an increase in the number of
ulcers of the stomach and duodenum, measuring from 2 cm and more, the so-called “giant ulcers” (GU) has been noted. “Giant ulcers” (more than 2.0 cm in diameter with a duodenal ulcer and more than 2.5 cm with a stomach ulcer), attributed to the most severe forms of PU. The latter are poorly amenable to drug therapy, often (40-50%) are complicated by gastrointestinal bleeding and penetration (40-70%) into neighboring organs. Often with “giant ulcers” of the stomach there are perforations and gastrointestinal fistulas. The frequency of “giant ulcers” (GU) of the stomach according to endoscopic examination is 8.6% [2, 3]. During the examination of patients suffering from giant-sized ulcers from 2.5 cm to 7 cm) in diabetic patients. According to our data, there were a history of stressful situations, uncontrolled intake of NSAIDs, eating disorders, abuse of smoking and alcoholic beverages.

In the course of the study, we analyzed 853 case histories of patients with PU who were treated in the specialized gastroenterological department of the Republican Clinical Hospital named after O. N. Semashko, Simferopol. It turned out that the proportion of GU in 1995 accounted for 258 of the patients with ulcer cancer - 31 of them had GU (12%), in 1999 of 323 - 30 with them had GU (9%), in 2000 - out of 272 - 33 of them had GU (12%), i.e., every hundred patients with peptic ulcer of stomach and duodenum have a giant ulcer. In connection with the above data there is a necessity to add drugs with reparative properties in particular dalargin along with standard traditional treatment regimens for patients with ulcer.

Dalargin (tyrosyl-D-alanyl-glycyl-phenylalanyl-leucyl-arginine diacetate) is a drug with cytoprotective, antisecretory, anti-inflammatory and immunomodulatory effects (Dudar, 1993). As a reparant, in the treatment of ulcer it has been used for more than ten years, equal in efficiency to the H2-histamine receptor blockers [4]. Its protective effect was proved by V.T. Smagin and co-authors (1986). The development of a non-parenteral route of administration (endonasal electrophoresis) for peptic ulcer disease belongs to the staff of the Department of Therapy and Gastroenterology, FPO, together with the Department of Physiotherapy and Balneology (Buglak N. P. et al., 1988). The following works are devoted to the study of the effectiveness of dalargin in the treatment of ulcer disease: Bulgakov SA, 1988, MV Levchenko, 1991. etc., but in these papers the effect of dalargin on the course of “normal” ulcers was studied. In our case, we are dealing with “giant ulcers” that possess the above flow features.

**Purpose of the study:** The aim of our research is to study the effect of dalargin on the course of giant gastric ulcer (GU) and duodenal ulcer(DU).

**Materials and Method**

The study and treatment was carried out in 80 people suffering from PU, with the presence of an ulcer defect ranging in size from 2 to 7 cm in diameter of these, 46 patients (34 men and 12 women) suffered from duodenal ulcer and 34 patients (22 men and 12 women) had gastric ulcer. The age of patients ranged from 26 to 70 years, of which Hp-positive - 89%. All of them complained of pain and heaviness in the epigastric region, nausea, belching, recurrent heartburn.

The diagnosis of ulcer was verified by clinical, instrumental (Fibro gastroduodenoscopy (FGDS) before and after treatment with the obligatory determination of the possibility of helicobacter infection and morphological study) method. The presence of Helicobacter pylori (Hp) infection was confirmed by cytological method (detection of Hp in a smear imprint).

Depending on the treatment regimen used, all patients were divided into 2 groups.

**Group 1 - 41 people (23 with DU and 18 with GU)** received the drug from the group of proton pump inhibitors (PPIs) - omeprazole 20 mg 2 times per day + amoxicillin 500 mg 4 times per day + metronidazole 500 mg 3 times per day - 7 days, i.e. standard triple therapy.

**Group II, 39 people (23 with DU and 16 with GU)** received along with standard therapy, dalargin-endonasal electrophoresis No. 12 according to the standard technique.

Monitoring the effectiveness of treatment was carried out using the assessment of the objective status of patients (the disappearance of pain and dyspeptic syndromes), control by FGDS every 2-4 weeks after the course of treatment.

**Research results:** Patients with PU in both groups, who received standard therapy and standard therapy + endonasal electrophoresis of dalargin, already for 2-3 days from the moment of the start of treatment, showed significant improvement (the intensity of pain and dyspeptic syndromes decreased significantly, Table 1).
Tab. 1. The average timing of the clinical manifestations of ulcer after the start of treatment.

<table>
<thead>

</table>

The complete disappearance of pain from the start of treatment in the first group of patients with PU was observed on day 13.2 (in patients with DU, on day 12 and in patients with GU, on day 16); In the second group, on day 11.0 (in patients with DU, on day 11, from GU, for 13 days). Disappearance of dyspeptic syndrome in groups I and II, on average, on days 12 and 9, respectively. In the I group in patients with DU, 11.2 days; with GU 13 days. In the second group - with DU - for 8.8 days, with GU - for 10 days.

Full scarring on the background of the treatment came in the I group on the 30.6 day; in the II group - for 27.8 days. (tab. 2).

Discussion

Peptic ulcer disease (PUD) results from an imbalance between stomach acid-pepsin and mucosal defense barriers. It affects 4 million people worldwide annually [8]. The incidence of PUD has been estimated at around 1.5% to 3% [9]. A systematic review of seven studies from developed countries estimated that the annual incidence rates of PUD were 0.10%-0.19% for physician-diagnosed PUD and 0.03%-0.17% when based on hospitalization data [10]. Although 10%-20% of patients with PUD will experience complications, only 2%-14% of the ulcers will perforate causing an acute illness [11,12]. Perforation is a serious complication of PUD and patients with perforated PU often present with acute abdomen that carries high risk for morbidity and mortality [13]. The lifetime prevalence of perforation in patients with PUD is about 5% [14]. PPU carries a mortality ranging from 1.3% to 20% [15,16,17]. Thirty-day mortality rate reaching 20% and 90-d mortality rate of up to 30% have been reported [18,19]. In developing world, patients tend to be young male smokers while in developed countries; patients tend to be elderly with multiple co-morbidities and associated use of NSAIDs or steroid[20,21]. NSAIDs, Helicobacter pylori, physiological stress, smoking, corticosteroids and previous history of PUD are risks factors for PPU [8,22-30].

In 1843 Edward Crisp stated that “the symptoms are so typical, I hardly believe that it is possible that anyone can fail in making a diagnosis” [31]. Symptoms of PUD include abdominal pain, upper abdominal discomfort, bloatedness and feeling of fullness. The classic triad of sudden onset of abdominal pain, tachycardia and abdominal rigidity is the golden signs of PPU.

The clinical manifestation can be divided into three phases [32]. In the initial phase within 2 h of onset, epigastric pain, tachycardia and cool extremities are characteristic. In the second phase, pain becomes generalized and is worse on movement. Typical signs such as abdominal rigidity and right lower quadrant tenderness may be seen. In the third phase, abdominal distension, pyrexia and hypotension with acute circulatory collapse may be evident.

PPU is a surgical emergency associated with high mortality if left untreated. In general, all patients with PPU require prompt resuscitation, intravenous antibiotics, analgesia, proton pump inhibitory medications, nasogastric tube, urinary catheter and surgical source control. Even though these standard therapy has effectiveness towards the complete cure of giant peptic ulcer, the use of dalargin proves to be more effective and more faster, which has been explained in our research.

Previously the authors showed that several endogenous opioid peptides and their synthetic analogs have marked antiulcerative activity in rats with an experimental model of cysteamineinduced duodenal ulcer [33, 34]. The substance with the strongest antiulcerative potential was found to be a hexapeptide, which was synthesized in Institute of Experimental Cardiology, All-Union Cardiologic Scientific Center, Academy of Medical Sciences of the USSR (Director M. I. Titov), and called as dalargin. It differs from the N-terminal fragment of dinorphine in replacement of Gly by D-AIa in position 2. Dalargin has now been
successfully used for the treatment of peptic ulcer in humans [35].

**Conclusion**

1. The use of dalargin promoted an earlier improvement in the subjective status of patients (the disappearance of pain and dyspeptic syndromes occurred 1-3 days earlier).

2. Complete scarring in a group of patients with PUD who received endonasal electrophoresis of dalargin occurred 4 days faster than in the group who received only standard therapy.

3. In patients with PU, the duration of cicatrization did not have a significant effect on dalargin, which can probably be explained by the difference in the etiopathogenetic factors in the formation of DU and GU.

4. It is advisable to combine standard therapy in the treatment of giant ulcers with the use of reparants, in particular, with dalargin endonasal electrophoresis.

**Conflict of interests:** None declared.

**Source of Funding:** Self funding by authors

**Ethical Clearance:** In our study involving all human participants were in accordance with ethical standards of the responsible committee on human experimentation and with the Helsinki Declaration of 1964 and later amendments.

Effect of Education about LGBT on Student of Faculty of Nursing Andalas University

Yonrizal Nurdin¹, Faradina Haniarahmah¹, Gusti Sumarsih¹

¹Faculty of Nursing Andalas University Campus Limau Manis, Pauh District, West Sumatra, Indonesia

Abstract

Lack of knowledge about LGBT in Nursing students will hinder the process of nursing care given to LGBT patients when practicing in health care settings. Therefore the knowledge of students must be improved, so that the implementation of nursing care can be maximized. This type of research is quasi-experimental with a one-group pretest-posttest approach with control group design. The sample amounted to 119 people, taken by proportional random sampling technique. The study was conducted from January to July 2017. Analysis of the data using a paired sample t-test. The results showed that there was an increase in the average knowledge and attitudes of respondents after being given an intervention. From the results of the test, analysis shows that there is an influence of education on the knowledge and attitudes of respondents ($p = 0.000$). It is expected that all respondents can always increase their knowledge about LGBT so that nursing care can improve the health of these patients.

Keywords: Students, nursing, education, LGBT

Introduction

Nurses as one of the health workers have some roles in carrying out their duties following their rights and authority. In nursing care to patients, a nurse has a role, namely: as a nursing care provider, advocate, educator, coordinator, collaborator, consultant, and as a reformer. One of the roles of nurses to improve the knowledge of patients and their families is the role of educators, namely helping patients improve their health through providing knowledge about care and medical actions they receive.

Low knowledge will make nursing care received by patients not optimal. This makes fear and lack of interest from nursing staff to treat patients, especially LGBT patients. Therefore a nurse must always increase her knowledge about health problems, especially about health care for LGBT patients, so that the nursing care provided can be optimal and help accelerate the recovery of patients, especially LGBT patients.

Increasing knowledge about LGB can be started from nursing students as prospective professional nurses so that nursing care given after becoming a professional nurse will be of higher quality. The results of several studies that have been carried out show that the attitudes of poor health workers can negatively affect the quality of nursing care received by LGBT individuals.

Method

This type of research is a quasi-experimental type of pretest-posttest control group design. This research was conducted from January to July 2017 with a total sample of 119 people. The statistical test used in this study was a paired sample t-test.

The intervention group was given health education about LGBT (definition, cause, impact, and prevention), using various media: pre-presentation with power points, small group discussions, videos, and leaflets. Whereas the control group did not carry out any intervention, but after completion of the study the control group would receive the same intervention as had been done in the intervention group.

Procedure for implementing intervention:

1. Sample selection of proportional stratified random sampling techniques.
2. Health education interventions; causes, effects and prevention of LGBT using media: presentations using power points, small group discussions, videos, and leaflets.
3. Health education interventions about LGBT are carried out in the classroom.
4. The intervention is carried out for 30 minutes.
5. Evaluation is carried out before and after the intervention.

Results

The number of respondents in the intervention group was 59 which consisted of 4 men and 53 women. While the control group amounted to 60 people, consisting of 3 men and 57 women. The results of the statistical tests show that in the intervention group there was a significant increase in the knowledge and attitudes of the respondents after being given the intervention, as shown in table 1 and table 2, below.

Table 2. Average Differences in Respondents’ Attitudes Before and After Education About LGBT

From tables 1 and 2 it appears that the average knowledge and attitude of the intervention group has a significant increase with a value of \( p = 0,000 \).

The results showed that there was an effect of education about LGBT on the respondents knowledge and attitudes (\( p \) value = 0,000). The average knowledge before being given education in the intervention group was 8.61 and the attitude before the intervention was given was 48.69. The average knowledge after being given education in the intervention group was 11.34 and the attitude before being given education in the experimental group was 52.88. For more details, see the following table.

Discussion

After conducting health education interventions about LGBT there was an increase in the average knowledge and attitudes of the respondents. By the theory that knowledge is the result of knowing something that happens after someone senses an object. Sensing can be through vision, illumination, smell, touch, and taste. The formation of one’s actions is strongly influenced by the knowledge they have. Therefore nurses must always improve their knowledge so that care services provided to patients, especially LGBT patients, can be more optimal (5).

Increasing the average knowledge of respondents after being intervened with knowledge about LGBT is also caused by the use of diverse learning media so that students’ understanding becomes better and students learn easily. The media used are: presentations, small group education or SGD (Small Group Discussion) with several groups of 4-5 people and brainstorming. With a variety of learning media that make respondents easier to absorb the material delivered can be well received (6-8).
The results showed that the average knowledge score after education was increased, from 8.61 to 11.34 with a difference of 2.73 points from before intervention. The results of statistical tests obtained \( p = 0.000 \) (\( p \leq 0.05 \)), meaning that there were differences in the average knowledge before and after education about LGBT respondents. The increase in knowledge is influenced by various factors, including the use of instructional media that varies during the intervention. To make the learning atmosphere more enjoyable so that the absorbency of the given knowledge is better when compared to just one learning media \(^9, ^{10}\).

Knowledge of cognitive is a very important domain for the formation of one’s actions (overt behavior). Likewise, the results of intervention research to improve nursing students’ knowledge about LGBT will greatly influence the attitudes and actions of implementing nursing care that will be provided by prospective nurse students to LGBT patients. So that LGBT patients can get good care without any prejudice that will hinder the provision of nursing care \(^{11, 12}\).

From the results of the interventions that have been given, it turns out that the intervention group experienced an increase in average knowledge far better than the control group. This is caused by many factors, one of which is the learning media used. In intervention research to improve knowledge and attitudes of prospective nurse students in providing nursing care to LGBT patients using a variety of media so that the atmosphere during the intervention is not boring and the material provided is easily absorbed by participants \(^7,^{12}\).

Another advantage of increasing the average knowledge of respondents can also be seen from the results of the average attitude of respondents who increased intervention a lot compared to the control group. The attitude after being given education shows that the average score of respondents before the intervention was 48.69 increasing to 52.88. Whereas in the control group there was no increase. Attitudes need to explore beliefs about LGBT sexuality that may be related to attitudes towards LGBT. This is very necessary to reduce or eliminate negative prejudice against LGBT patients. So that the care provided by nurses will be more optimal which of course will benefit patients by shortening the day of care for LGBT patients \(^6,^{11}\).

This research shows that health education interventions have the power to increase positive attitudes about LGBT. From the results obtained, it can be seen that the need for continuous improvement in the curriculum and the development of validated evaluation tools for health professional curriculum is one of them is nursing staff. The findings of this study indicate that respondents acknowledged that there was still a lack of knowledge they had to treat an LGBT patient, both in the formal and informal curriculum associated with the LGBT population. Thus there is a need for professional efforts to improve LGBT health training for all nursing staff. Professional approaches are especially valuable in their capacity to utilize existing resources to increase knowledge that has the effect of long-term change, both individually and in groups \(^5,^{12}\).

**Conclusion**

The conclusions that can be taken based on the results of the study are: There is an educational effect on LGBT on the knowledge and attitudes of respondents (\( p\)-value = 0.000). Suggestion: It is expected that all nursing staff can always improve their knowledge and understanding of LGBT so that nursing care given to suspected LGBT patients can be optimal.

Mental Health and Social Capital among B40 Groups in East Coast of Peninsular Malaysia

Zainul Zolkifeli1, Aziz Amin2

1Student, 2Professor, Faculty of Applied Social Sciences, Universiti Sultan Zainal Abidin

Abstract

The purpose of this study was to evaluate the effect of social capital towards mental health among low income group. Malaysia Department of Statistics recorded 2.7 million of the low income group known as B40 in year 2016. This is a very serious situation because mental health can affect quality of life. To wear out this issue, communities are urged to utilize social capital as a device to improve mental health. This study involved respondents among low income group in Kota Bharu district and a set of 120 questionnaires was formulated to collect data. Statistical Package for Social Science (SPSS) was used to analyze the data. The result shows the elements of social capital contribute positively to the mental health. The government can utilize this finding as a foundation to create a better policies, procedures and programs for the communities and also significant in enhancing the level quality of life.

Keywords: Mental health, social capital, peninsular Malaysia.

Introduction

Mental health is a developing general wellbeing concern and has been evaluated to move up to 450 million individuals over the world. In nations with highly populations, to excess of 33% of the populace will meet the standards for some type of psychological instability among their life.1 State of mind and tension issue have a tendency to have the most high extensiveness rates and it has been expected that real depressive issue will be the second driving infection load universal by 2020.2 Psychological neurosis frequently has endless impacts that can last a life-time and harmfully influences people’s personal satisfaction at home, school, work, and in social settings.3 This problem is being discussed among current social researchers because it can affects quality of life. This issue also is closely related to economic and income factors. Department of Statistics 2015 found 2.7 million B40 groups with 63 percent living in the urban areas and the remaining 37 percent were rural.4 Mental health is generally connected with social capital dimensions, for example, gatherings, trust and solidarity, aggregate activity and social attachment. There were a few studies that show the role of communities in order to develop the country.5,6

Nahapiet et al., said that social capital is in a general wisdom and there is still no identical understanding, neither correct meaning for instance.7 Burt described social capital as the structure of relationship frameworks and facts available to an individual,8 while Coleman even just described social capital as a sort of capital, and can be made when the association between individuals is used to support their exercises.9 Nevertheless, there is still no correct and completely recognized meaning, for example, Bourdieu described social capital as the addition of genuine and potential resources inside a precise framework, where the framework is made out of associations that incorporate shared partner and basic verification,10 while Adler and Kwon described it as the arrangement of associations which builds the estimation of the general population framework characters by getting to the assets fixed in the framework.11 Amin and Zolkifeli has conducted research about analysis dimensions of social capital among poverty group in suburbs and the results shows that social capital is still relevant in communities.12

A universal researcher of the social capital and mental health writing demonstrate that investigations of depression have a main piece of the writing. The high pervasiveness rates of depression and the ease of estimating depression through short polls likely give to a limited extent to noticeable quality of research on unhappiness and social capital. Most investigations of social capital and unhappiness have utilized communitarian scopes of social capital, for example, trust and support. A few examinations have demonstrated
individual-level summed up trust to be identified with depressive side effects. In thinks about estimating obvious neighborhood trust, higher trust in neighbors has additionally been looked to be a defensive factor of sadness. Studies utilizing indicators of network interest and charitable effort to gauge social capital have not demonstrated social money to be identified with sadness. While singular level considers have loaned some help for the connection among discouragement and social capital, the scopes of social capital utilized in these investigations are tricky since they have a tendency to incorporate just communitarian estimates, for example, trust and interest. To overcome this problem, the researchers had proposed to apply social capital in order to get a better mental health. Besides, low income group are need to change their role and be a part of social capital.

The determination of this study is to know how social capital among low income group will influence mental health. The hypothesis model of this study was developed based on a few theories that relates to important dimensions of social capital incorporate instruction, wellbeing, shared help additionally is related with independent financial advancement without requirement for government mediation. Based on previous study, six dimensions of social capital were recommended. The dimensions are networks & communications, trust, value, norms & habits, social rules, ability or capability and religious needs. All the dimensions were predicted to influence the mental health.

Measures: The study was applied a survey by quantitative method. The study individuals were low income group households in Kota Bharu. The questionnaire used five point Likert scale, ranging from “Strongly disagree” to “Strongly agree”. The questionnaire contains of six dimensions that were to evaluate the research variables that is social capital. A collection of 120 respondents had addressed the poll. Statistical Package for Social Science (SPSS) was used to analyze the data. The interaction between variables was tested using regression weight, while the amount of prediction was calculated by R squared.

Table 2 displays the descriptive measurements of social capital among low income group in Kota Bharu. The statistics shows these dimensions, network and communication (mean=3.2747, std. dev.=0.39099); trust (mean=3.3458, std. dev.=0.36566); value, norms & habits (mean=3.3580, std. dev.=0.37538); social rules (mean=3.3347, std. dev.=0.37432); ability or capability (mean=3.4125, std. dev.=0.39321) and religious needs (mean=3.5743, std. dev.=0.37902). The level of social capital among low income group was at a high level as shown.

By hypothesis testing, the findings show all dimensions of social capital contributing significantly to mental health. The findings also show that all dimensions of social capital contribute 10.8 percent to mental health. Testing of regression social capital contributing positively to the mental health low income group. All the results were concluded in final model as shown in Figure 2.

**Conclusion**

This study is also applicable to a wide range of social studies in Malaysia. Based on the result shows that social capital was played an important role by contribute positive percentage of regression to mental health among low income group in Kota Bharu. Social capital can be a profitable resource for associations and managements should attempt to encourage it by empowering social connections between workers, specialty units and even with colleagues. Therefore, government can utilize this finding as a foundation to create better policies, procedures and programs for the communities.

In future, this study can be extending by looking at others aspects of influence mental health such as quality of life. It is because quality of life seems to be very important element in community development through the studies that has been conducted by a few researchers. 24, 25, 26, 27

The Influence of Nurse’s Knowledge Level on Behaviour Changes, Attitude and 5 Moments of Hand Hygiene Compliance

Danoe Soesanto

Department of Public Health and Humaniora, Universitas Ciputra Surabaya, Indonesia, UC Town Citraland, Surabaya, Indonesia

Abstract

Introduction: The five moments of handwashing, established by the World Health Organisation (WHO), are important to break the chain of transmission of disease. Human behaviour is influenced by two factors, namely behavioural factors and factors related to outside behaviour. Behaviour is formed from three factors: predisposing factors (knowledge, attitudes, beliefs and values), supporting factors (physical environment, availability or absence of health facilities) and reinforcing factors (in the form of the nurses’ attitude and behaviour). This study aims to determine the effect of the level of knowledge of nurses in nursing homes on their attitude, behaviour and adherence related to the 5 moments of hand hygiene.

Method: This study used a questionnaire to measure the level of knowledge, attitude, behaviour and level of adherence of the nurses concerning the 5 moments of hand hygiene. The research design used a analytic cross-sectional approach. The respondents were all nurses at Panti Werdha Surya, and the sampling technique used was purposive sampling. The study was conducted between January and April 2018.

Results and Analysis: The data was analysed using a multinomial regression test. The results showed the influence of nurses’ level of knowledge on attitudinal changes (p = 0.000). There was an influence from the nurses’ level of knowledge on behavioural change and there was influence from the nurses’ level of knowledge on compliance with the 5 moments of hand hygiene (p = 0.000) in an effort to prevent the transmission of shingles in nursing homes.

Conclusion: The level of knowledge of nurses needs to be improved continuously, so then changes in attitude, behaviour and adherence take place concerning the 5 moments of hand hygiene. This is as well as providing hand washing and rubbing facilities at each door within the nursing home.

Keywords: Level of Knowledge, Attitudes, Behaviour, Compliance, Nursing home.

Background

An elderly individual, according to Article 1 number 2-3 Law Number 13 Year 1998 about the Prosperity of the Elderly, is a person who has reached the age of 60. Community groups including the elderly mostly now live in nursing homes, and there is a trend that society is continuously increasing in relation to life expectancy. The elderly who live in a nursing home are susceptible to contracting infectious disease. This can be caused by the prevalence of organ function decline, the existence of dementia and incontinence, poor oral hygiene, and trouble swallowing.

Infectious diseases that commonly affect the elderly in nursing homes include pneumonia, urinary tract infections and skin and soft tissue infections. Pneumonia is still the main cause of morbidity and mortality in adults.

who are older, and, with an increase in age, it becomes the cause of almost half of all hospitalisations and related deaths\textsuperscript{2,3}. A population census from a statistics agency in 2010 showed that the elderly in Indonesia were counted as being 18,043,712; in other words, 7.68% of 237 million Indonesian citizens were elderly\textsuperscript{4}. Hand hygiene is a main and important factor related to preventing the spread of pathogens and antibiotic resistance, whether in hospitals or in nursing homes, because the number of infections that can be transmitted through the hands of a caretaker is vast. Hand hygiene can prevent Health Care Associated Infections (HAIs) and increase the health of the elderly. Hand hygiene is a part of standard care that can decrease infections in the health team and also in the patients\textsuperscript{5}. Washing of the hands is one of the effective steps undertaken to break the chain of infection transmission, hence the number of incidences of nosocomial infections and Health Care Associated Infections can be reduced\textsuperscript{6}. Research results shows that effective education programs can increase knowledge, positive behaviour, the right practices when conducting prevention policies and infection control\textsuperscript{7}. Non-compliance when concerning hand hygiene is a bad behaviour and one that can be controlled during training\textsuperscript{8}. Health workers need more information and education on the prevention and control of infection, especially in relation to hand hygiene to increase the quality of the offered health services\textsuperscript{9}. There is a relationship between the knowledge of a nurse regarding nosocomial infection with washing of the hands, as observed at the Inpatient installation in Dharmais Cancer Hospital in Jakarta\textsuperscript{10}. Knowledge and behaviour are factors that relate to nursing practices and the prevention of nosocomial infections in phlebitis events in RSUD, Semarang\textsuperscript{11}.

The knowledge of a nurse about the 5 moments of handwashing is very influential and related directly the practice of handwashing. In the previous research, the knowledge of nurses on hand washing was still categorised as not good according to the results (70.5%)\textsuperscript{12}. The five moments of handwashing are not implemented well by nurses. This is supported by the research of Koeswo dan Pratama (2015), where it was shown that nurses do not wash their hands in the first moment by 52%, 50% in the second moment, 75% in the third moment, 69% in the fourth moment and 78% in the fifth moment. Previous research done by Pateda dan Rabbani (2013) showed the results that 16.7% of hand washing behaviour was in the good category, 24.4% was in the less good category and 59% was in the bad category. Supporting factors including physical environment and the available health facilities for hand washing that, when realised optimally, can ease the realisation of the positive attitude and behaviour of the health worker when it comes to doing the 5 moments hand Hygiene\textsuperscript{13}. The purpose of this research in general was to acknowledge the impact of the level of education of nurses on the attitude, behaviour and obedience of nurses in Surya Surabaya nursing home concerning the practice of the 5 moments of Hand Hygiene.

**Method**

The research design used was analytical and observational, using a cross-sectional approach. The population in this research included all executive nurse in Surya Nursing Home who had worked there for at least 2 years. The technique used to take samples was saturated sampling, where all the available population became the sample of the research. This research was conducted between January and April 2018. The data was taken using a research instrument in the form of a questionnaire about the characteristics of the nurse, and their level of knowledge, attitude, behaviour and obedience using a Likert scale model (5). Before we did the main body of the research itself, we conducted a validity test and questionnaire about the reliability beforehand. We then analysed the data obtained using a multinomial logistic regression test.

In Table 1, the respondents were categorised based on their sex, age, level of education and working time (n = 22). All of the respondents were female (100%), and almost all of the executive nurses were aged between 31 years old – 40 years old (81.82%). The level of knowledge of almost all of the executive nurses was that of high school (77.27%) and most of the executive nurse had worked for 6-8 years.

Based on Table 1, we can see that almost all of the nurse’s had a level of knowledge about the 5 moments of hand hygiene in the bad category (86.36%), and that only a few of the executive nurses had good knowledge (4.55%). Meanwhile the attitude of the nurses about hand hygiene being able to prevent the transmission of disease showed that most of them stated Agree (72.73%), and only a few of the executive nurses stated Strongly Agree (4.55%). The behaviour of the executive nurses in the context of supporting hand hygiene to prevent the transmission of disease showed that almost all of them stated Average (77.72%), and only a few stated Very Supportive (9.09%). The level of Obedience of the nurses in doing the 5 moments of hand hygiene found that most of them stated Disobedient (54.55%), and only a few stated Obedient (4.55%). This research shows that there is a meaningful and positive correlation between the level of knowledge of the nurse about the 5 moments of hand hygiene and the obedience of physically doing the 5 moments of hand hygiene, with a strong level of correlation (r=0.701; p=0.021). This means that the lower the knowledge of the nurse about the 5 moments of hand hygiene, the worse the obedience of the nurse when it comes to doing the 5 moments of hand hygiene. The results of the multinomial logistic regression test showed that the level of knowledge of the nurses about the 5 moments of hand hygiene can only explain the quality change in the level of obedience but also that the impact of knowledge level is significant (p=0.000). Regarding the attitude of the executive nurses, there is a meaningful correlation between the attitude of the nurse about the 5 moments of hand hygiene and obedience when it comes to physically doing the 5 moments of hand hygiene, and it was shown that the power of the correlation is weak (r=0.190; p=0.031). This means that the better the attitude of the nurse about the 5 moments of hand hygiene, the better the level of obedience when physically doing the 5 moments of hand hygiene. The results of the multinomial logistic regression showed that the attitude of the nurses about the 5 moments of hand hygiene can be used to explain the impact of the attitude of the nurse about the 5 moments of hand hygiene by 10.7% and that the impact of the attitude of the nurse related to obedience is significant (p=0.000). Regarding the behaviour of the executive nurse and obedience when doing the 5 moments of hand hygiene, there was a meaningful correlation between the behaviour of the nurse and obedience, and the correlation was strong (r=0.690; p=0.001). This means that the more supporting behaviour that there is from the nurse regarding the 5 moments of hand hygiene, the better the level of obedience. The results of the multinomial logistics regression test showed that the behaviour of the nurses concerning the 5 moments of hand hygiene react with the obedience of the nurse and the 5 moments of hand hygiene by 13.8% and that the impact is significant (p=0.000).

**Discussion**

The respondent’s knowledge regarding the 5 moments of hand hygiene is linked to their associated level of obedience (p=0.000). The higher the respondent’s knowledge about the 5 moments of hand hygiene, the more obedient the nurses were when it came to practising the 5 moments of hand hygiene (r=0.701). The impact of the level of knowledge had a big impact on the obedience of the nurse by 10.1%. This shows that the impact on obedience comes from a different factor other than knowledge (89.9%). The finding of
this research supports the previous research done by Al-Khawaldeh, Al-Hussami and Darawad (2015), who stated that education on hand hygiene will affect the knowledge, attitude and behaviour of paediatric nurses and NICUs in Zanjan hospitals\textsuperscript{14}. Other than that, the awareness of nurses about the right way to wash their hands is a process that pushes them to adhere to hand hygiene situations. Hence, the quality of nursing care is affected by the knowledge, attitude and behaviour of the executive nurses who provide health care. Only a little part of this research was specially related with the nurses, although there is evidence that shows that the obedience of nurses related to doing the 5 moments of hand hygiene can be improved by the application of audits and increased knowledge and supervision, which will cause a change in the culture of the working environment and obedience to promote doing the 5 moments of hygiene the correct way\textsuperscript{15}.

The research findings show that there is a gap in the level of knowledge of the nurses, which can be overcome with a short and more frequent training system, especially in hospitals. The guidelines on the 5 moments of hand hygiene are well known by nurses and well-promoted in hospitals. This is reflected by the positive attitude of the nurse and non-medical staff. Improving the compliance of the nurses can be done by training continuously\textsuperscript{16}. The nurses needs to remember the lessons from their study experience, because this will be effective at increasing their knowledge and understanding that this will also affect their behavior in a positive way. This means that the importance of the individual’s experience has a bigger impact than formal teaching methodology\textsuperscript{17}.

**Conclusion**

The knowledge, attitude and behaviour of executive nurses has a significant effect on the obedience of executive nurses concerning the 5 moments of hand hygiene. Other than the level of knowledge, attitude and behaviour of the individual nurse, it is suspected that age and working time also affects the obedience of the executive nurse. Training and the periodic delivery of information is needed whether by electronic media or via practice to increase the level of knowledge of nurse is important, so then nurses will be more obedient at adhering to the 5 moments of hand hygiene. Other things that can increase the obedience of the nurse concerning their adherence to the 5 moments of hand hygiene is by supplying all doors with hand rub to ease the implementation of the 5 moments of hand hygiene.

Feeding Care Patterns of Mothers Working as Shellfish Peelers on Children’s Nutritional Status at Integrated Health Posts in Coastal Areas

Meiana Harfika¹, Zhakiyah Saraswati¹, Dya Sustrami¹, Lela Nurlela¹

¹School of Health Sciences Hang Tuah, Surabaya, Indonesia, Jl. Gadung No. 1, Surabaya, Indonesia

Abstract

Introduction: Working mothers can influence the nutritional status of their children. Nutritional status is a condition that is influenced by the intake of nutrients in food needed by the body. Nutritional status is very important for the process of growth and development in children. The nutritional status of a toddler is influenced by several factors such as parenting.

Method: The research design used an analytical observation with a cross-sectional approach. Samples were taken using a simple random sampling technique obtained as many as 40 respondents in the mother group, where they all worked as shellfish peelers. The instruments of this study were the Feeding Pattern questionnaire and Nutrition Status assessment using the Anthropometry observation sheet. The data was analysed using the Spearman Rho test.

Results: The results showed that there was a relationship between feeding, the parent working as a shellfish peeler and the nutritional status of the child. The Spearman Rho test results were ρ = 0,000 (ρ <0.05).

Discussion: The implication of this research is that there is a relationship between the parenting style of the mother working as a shellfish peeler on the nutritional status of the toddler. It is expected that the research respondents can improve the provision of feeding by paying attention to the nutritional needs of their toddlers.

Keywords: Toddler Nutritional Status, Eating Pattern, Working Mother.

Introduction

Regarding nutritional status prevalence according to the WHO in 2013, globally it was estimated that in 101 million children under the age of five (toddlers), 15.7% are underweight and 6.6% are overweight. Nationally, in 2013, the underweight prevalence was 19.6% were severely malnourished and 13.9% were undernourished. Based on the Millennium Development Goals (MDGs) indicator, the number of severely malnourished children that an area of city must achieve by 2015 is 15.5%. The East Java Province is still categorised as an area with one of the highest severely malnourished percentages, at 4.8%. In the 2013, the severely malnourished percentage was 19.6%. In 2014, there was a significant increase, up to 14.8%. Sidoarjo Regency’s children under five showed a percentage of severely malnourished children with weight in accordance to age being under the red line weight as much as 1.02% (1,072). This is less than what was 1.22% (1,298 children) in 2013. Based on the weighing of children under five done throughout 2013, the number of malnourished or underweight children was 5.25% (weight according to the age Z-score between > -3 year primary school to < 2 year primary school as per the Kartu Menuju Sehat a card used in Indonesia to keep track of a child’s growth monthly), which is on the yellow stream above the red line. The results showed that 91.54% were well-nourished (normal weight), 1.98% were over-nourished (overweight) and 1.22%
were severely malnourished (very underweight). For the
malnourished percentage, 2014 showed a percentage of
4.92% which was less than 2013, which was 5.25%. The
researcher’s interview with the nutritional staff on the
22nd January 2018 at Sedati Sidoarjo’s Integrated
Health Post revealed that there were 84 Children Under
Five Integrated Health Posts in 16 villages, where 3
children under five suffered from severe malnutrition
with comorbidities. There were malnourished children
in several other villages. From the interview with the
Village Midwife (Bidan Desa) in Gisik Cemandi
Village, there were 11 children under five (7.3%) out
of 150 children under five that were malnourished. The
interview with Belanak and Dorang Gisik Cemandi
village Integrated Health Posts group revealed that the
total number of mother’s working as shellfish peelers
and stay at home mothers who had children under five
were as many as 88 people, separated into 44 (50%)
mothers working as shellfish peelers and 44 (50%) stay
at home mothers.

The interaction between being malnourished and
infection may cause deadly disease cycles and a worsened
nutritional status\(^8\). One of the ways to increase children
under five’s nutritional status is by giving supplementary
feeding. Supplementary feeding may be given to children
under five from 6 months up to 23 months and 29 days
with a skinny nutritional status, which is measured
based on the weight index according to their height and
a minus 3 deviation standard (-3DS) to less than minus 2
deviation standard (<-2DS), for 90 days. Supplementary
feeding of skinny children under five may be local
supplementary feeding and even factory supplementary
feeding in the form of breastfeeding companion biscuits
(biscuit MP-ASI). Once their weight has reached normal
or in accordance to their height, supplementary feeding
will be discontinued. Hereinafter, the children may
consume the family’s balanced nutrition, which will
be done under weight monitoring to avoid the chance
of children under five falling back into the skinny
nutritional status\(^7\).

A mother’s working status certainly affects their
children’s growth and development. Mothers who work
have many options. There are mothers who choose to
work at home and there are mothers who choose to work
outside or far from home. The latter must be able to
manage their time for their family because a mother’s
main task is to manage household affairs including
looking after, managing and guiding children\(^8\).

Nutrition in children under five must be fulfilled,
because nutrition will affect the toddler’s growth in
future. Stay at home mothers have more time for their
toddlers than working mothers. This is because working
mothers must split their time to play the role of a
working mother and a housewife. The solution given
by the researcher was to give counselling to mothers
working as shellfish peelers and stay at home mothers
on the correct feeding care patterns to avoid malnutrition
in children under five.

Based on the background description and supported
by the preliminary studies which have been done, the
writer is interested in doing research on the relationship
between the feeding care patterns of mothers working
as shellfish peelers on children under-five’s nutritional
status at integrated health posts in coastal areas.

Method

The research design used in this research was an
analytical observation that looked for a relationship
between the variables with a cross-sectional approach.
This kind of research emphasises on the independent and
dependent data measurements one at a time.

The population in this research was mothers working
as shellfish peelers with children under five at Belanak
and Dorang Gisik Cemandi village Integrated Health
Posts. The sampling technique used in this research
was sampling randomly sampled mothers working as
shellfish peelers with children under five, thus fulfilling
the inclusion criteria of 40 respondents.

The tools used to collect the data were questionnaires
for the demographic data and feeding care patterns
along with nutritional status observation focused on
children between the ages of 12-60 months using an
anthropometrical table. Bivariate data analysis was used
to find out the relationship between the feeding care
patterns of mothers working as shellfish peelers and the
children under five nutritional status. This research used
a Spearman Rho statistical test.

Spearman Rho Value Statistic Test 0.000 (ρ = 0.05)
Discussion

Based on the data on the feeding care patterns of mothers working as shellfish peelers related to their children’s under-five nutritional status at Gisik Cemandi Sedati Sidoarjo Village Coastal Area Integrated Health Posts, as shown in the table above, there were 5 respondents (100.0%) that did not conduct good feeding care patterns, resulting in malnutrition in the respondent’s toddler. A further 3 respondents (100.0%) that did enough in relation to the feeding care pattern had well-nourished toddlers, and 1 respondent (3.1%) had a good feeding care pattern that resulted in over-nutrition. Nutritional status is a condition that is caused by a balanced status between nutrient intake and the number of nutrients required by the body for the running of its biological functions such as physical growth, development, activities, health care etc. A toddler’s nutritional status is affected by many factors, both direct and indirect. Direct causes that affect nutritional status are nutrition intake and any infections suffered by the toddler. Indirect causes include food availability, while keeping in mind the parent’s job and income, parenting and care patterns, the available health services and environmental health. The three indirect causes are related to the level of education, knowledge, and family skill. The researcher argues that a working mother must be wise in relation to time management, because her time will be divided between work, childcare and domestic chores. This case is proven by the research results as shown above, on how the mother’s that were working as shellfish peelers had toddlers who were malnourished. The mothers in coastal areas stated that there is difficulty when their role as shellfish peelers made them unable to feed their children on time.

The link between the feeding care pattern of mother’s working as shellfish peelers on children under five (toddlers), is as shown in the Spearman Rho statistic test result in Table 13; \( p = 0.000 < \alpha = 0.05 \) as a comparison. The coefficient correlation between the variables gained from the statistics test was 0.771, which means that there is a strong correlation. H1 was therefore accepted, statistically showing that there is a relationship between the feeding care patterns of mothers working as shellfish peelers on their toddler’s nutritional status at Gisik Cemandi Sedati Sidoarjo Village Coastal Area’s Integrated Health Post.

Conclusion

Based on the results of this research, the outcome is that regarding nutritional status, the mothers working as shellfish peelers with toddlers did not do well at taking care of their child’s nutrition and they lacked a proper feeding care pattern. The toddlers of mothers working as shellfish peelers suffered from malnutrition because the mother’s activities were more important than looking after and paying attention to their toddler’s nutritional intake.

Determination the Role of Interleukin 31 (IL-31) Levels in Three Real Allergic Diseases (Asthma, Rhinitis, Urticaria)

Ali F. Hashim, Alia E.M. Alubadi, Suad A. Brakhas, Intesar Y. Al-ani

Abstract

Interleukin-31 is a proinflammatory cytokine, has multiple physiological functions, including regulation of immune response, blood formation (hematopoiesis), and causing many diseases including dermatitis and airway hypersensitivity. The relationship between IL-31 and three types of allergic diseases (asthma, rhinitis, urticaria) are not quite described in the research, consequently, this study was done to demonstrate the levels of IL-31 in Baghdad population /Iraq. This study compared IL-31 levels in these three types who were positive for total and specific IgE in patients and compared with healthy controls were negative for total and specific IgE.

A total of 148 allergic patients included in the present study with different allergic diseases (asthma, rhinitis, and urticaria) who diagnosed by the physician through clinical profiles and by lab investigation through total IgE and specific IgE, with the control group which was excluded the subjects who have a high level of the total IgE. The patients were recruited from Allergic Specialized Center/Baghdad-Resafa, Iraq. The level of interleukin 31 was measured in sera of 52 asthmatic patients, 48 rhinitis patients, 48 urticaria patients, and 28 control. The level of total IgE increases significantly in patients with allergy compared with control, and the levels of IL-31 in patients’ sera were significant increases in comparative with control; the present study provides new knowledge about the role of IL-31 into the underlying pathogenesis of allergic diseases.

Keywords: Asthma, rhinitis, urticaria, interleukin-31, total IgE.

Introduction

Cytokines play a major and important role in regulating the immune system (adaptive and innate), because of its importance in pro-inflammatory processes (1), cytokines have been used to understand disease mechanism and as biomarkers in many diseases (eg allergic inflammatory disease, atopic dermatitis, rheumatoid arthritis, asthmatics, skin diseases and cancer (2,3,4,5).

Interleukin-31 is a proinflammatory cytokine, 24 kDa protein, identified firstly by Dillon and their colleagues in 2004, from glycoprotein 130/IL-6 family coded by a gene located on chromosome 12q24.31 (1,6,7).

IL-31RA and IL-31 ligand interaction lead to stimulating the expression of proinflammatory cytokines and chemokines (1).

Interleukin-31 controls many biological functions by controlling the signals that regulate these functions; it stimulates proinflammatory cytokines, manages cell proliferation and also participates in tissue remodeling (8).

IL-31 works on a wide range of cells, whether immune or non-immune, and thus has multiple physiological functions, including regulation of immune response, blood formation (hematopoiesis), and causing many diseases including dermatitis, airway hypersensitivity and inflammatory bowel disease (1).

Many studies indicated that IL-31 promoting allergic inflammation (9,10,11), between IL-31 levels and three types of allergic diseases (asthma, rhinitis, urticaria) are not quite described in the research, consequently, this study was done to demonstrate the levels of IL-31 in Baghdad population /Iraq. This study compared IL-31 levels in these three types who were positive for total and specific IgE in patients and compared with healthy controls were negative for total and specific IgE.
Material and Method

A total of 148 allergic patients (52 asthma, 48 rhinitis, 48 urticaria) with 28 apparently healthy control group included in the present study. The patients were recruited from Allergic Specialized Center/Baghdad-Resafa. Five ml of peripheral blood was drawn from each subject into plain tubes and left at room temperature for 30 minutes until they coagulated and then centrifuged at 4000 rpm for 5 minutes until sera were obtained, sera samples separated into different tubes and stored at −20°C until the study. Total IgE levels were estimated by Immunoenzymetric Assay using the total IgE ELISA kit (Euroimmun/German) while Specific IgE qualitative assay by using Western Immunoblotting method for (Inhalation and food profile) multi-parameter assay containing 20 of the most common allergens to each profile was used by (Polycheck-Allergy Diagnostic/German) kit.

A sandwich Enzyme immunosorbent assay was used to Interleukin-31 determination in human serum by Interleukin-31 ELISA kit from (USCN-China).

Statistical analyses were performed by Minitab version 13 software. All data of the current study were expressed as mean ± SE. The data were analyzed using one-way analysis of variance (ANOVA). Non-parametric data were expressed as a percentage of the total and compared using the binomial test.

Result

The concentration of total IgE (Mean± SE IU/ml) in sera were of the asthmatic patients (336.1 ± 23.0), Rhinitis (258.4 ± 25.8), and urticarial patients (235.9 ± 21.4) while in all allergic group was (282.5 ± 13.5), and in healthy control was (44.9 ± 4.21). There were a highly significant differences P = 0.000 (P>0.01) for the total IgE levels of the all three allergic patients (Asthma, Rhinitis and Urticaria) when compared with apparently healthy control. Also a highly significant difference P = 0.002 (P>0.01) between asthma and urticaria, and a significant difference P = 0.026 (P>0.05) between asthma and rhinitis. While there was no significant difference P=0.501(P<0.05) between rhinitis and urticarial patients as shown in Table (1).

The Table (2) explain the result of specific IgE (sIgE) to 20 inhalant allergens (Inhalation profile) in sera of asthma, rhinitis and urticarial patients. Where the results of this test showed the presence of sIgE against one or more inhalant allergen in the majority of patients in the three groups under study. The results showed the percentage of positive results of sIgE were significantly higher than the negative result for all groups of patients under study, there were (84.6%, 81.3%, and 72.9%) in (asthma, rhinitis, and urticaria) respectively. While those who had a negative test were 8(15.4%) in asthma, 9(18.7%)in rhinitis, and 13(27.1%) in urticaria. There were also highly significant differences p> 0.01 between positive and negative results.

Discussion

As Table (1) shows, the level of tIgE increases significantly in patients with allergy compared with control, and this is consistent with the results of several studies(12,13,14) Who found in their studies high levels of IgE in allergic patients with highly significant differences in comparison with healthy.

Yalcin in Turkey (2014) in his study also pointed to a rise in the level of IgE in urticarial patients compared to control(12).

Brakhas and their colleagues also had a high IgE level in patients with (asthma, allergic rhinitis, and urticaria) with highly significant differences when compared with control(15).

All of the above studies support the primary role of IgE in maintaining symptoms severity and immune response in allergic diseases (16). IgE mediates type 1 hypersensitivity reactions and the association of this antibody by a special receptor (Fc Epsilon RI) with the surface of the basophils and mast cells leads to the release of inflammatory mediators and the effectors of allergic reactions from cells. As a result, allergies appear within minutes to several hours (17).

An allergic reaction occurs after contact with particular allergens within minutes, and lead to type hypersensitivity allergy, which produces Total IgE and sIgE by specific B cells and resulting in anaphylactic asthma, rhinitis, allergic, urticaria (18). Kim et al., (2012) found that 68.39% of all allergic rhinitis patients in his study had a positive sIgE test against one or more allergens(19). The negative results may due to the lack of allergic causatives in the test profile, or the test profile of allergens kits is not suitable for some populations and that requires further research.

The results of the current study show that the number of negative results of sIgE for food allergens in...
patients with urticaria was more than positive against one or more of the most common 20 Iraqi food allergens.

The results of Previous study indicated that food allergy is uncommon in chronic urticaria (20) and this corresponds to our results where we notice that the inhalation allergens are more frequent than food allergens table (3).

In this study, elevated levels of IL-31 were observed in all three groups of allergic diseases (Rhinitis, Urticaria, Asthma) than control, and there were significant differences when compared these three groups with control.

These results are in agreement with many studies which they found there was a higher level of IL-31 in allergic rhinitis patients than control group with significant differences(11, 21, 22), and for urticaria disease many studies found results matching to our study which found significant increases in IL-31 level in comparison with control(9, 23, 24). also for asthma this result agrees with many studies which refers that IL31 had a significant role in the pathogenicity of allergic disease and there were a higher level and significant differences of IL-31 in asthmatic patients compared to control (7, 22,25). the study of Saito et al 2017 found the Th2 immune responses regulation may be dependent on tissue-specific cell types expressing IL-31RA) (27).

Interleukin-31 is involved in the pathogenesis of allergic disorders such as rhinitis, asthma, dermatitis, and urticaria (9,10) another study investigates the Japanese cedar/cypress pollinosis extract could strongly stimulate IL-31 expression (29), while Baumann and his colleagues in 2012 found that IL-31 detected in the nasal secretions derived from Allergic rhinitis patients (11), IL-31 is selectively generated by activated CD4 T cells (6).

Previous studies explained that IL-31RA expression related to the induction of the Th2 immune response (26,27). Other studies indicated that IL-31 negatively regulates the development of the Th2-type response (27,28).

**Conclusion**

In conclusion, we found that IL-31 is increased in the serum of allergic patients (asthma, urticaria, and rhinitis), the present study provides new knowledge about the role of IL-31 into the underlying pathogenesis of allergic diseases.

The Impact of Learning Technology on Some Motor Skills of Deaf and Mute Students in Comparison with Healthy Students

Maytham Mohsin Habeel Alhamdi1, Salah Bresem Salih1, Mahmood Abd ALjaleel Abd2

Abstract

The use of learning technology is very important for physical education, and the importance of using learning technology for enhancing motor skills appears when finding the perception of new motor skills is incomplete and thus the need to use learning technology to improve their perception and skills. Learning technology lead to flexibility in the process of education in addition to the importance of using the computer in the field of sports where the computer can be used to learn the activities of motor activities through the analysis of movements and skills contained in the course or training plans and identify the technical skills of these activities and the appropriate learning method, it also contributes to facilitating and simplifying the learning process of motor skills, as well as shortening learning time, which helps to improve learning processes (1). The researchers believe that learning is usually related to the educational method which the teacher use, and which mainly directed to correct the errors resulting from the learner’s motor performance. Knowledge of learning technology represents information about movement. In order to use this knowledge, the learner must recognize the nature of the skill performance. (Deaf and mute), appropriate to their ability and needs and their positive impact on the revitalization and development of their skills and needs, as well as improving their perception of themselves and their self-esteem and self-confidence (2).

Keywords: Learning Technology, Deaf, Healthy students.

Research Problem

Through the previous studies and research for the people with special needs, we find the deaf and mute persons don’t not understand the educational situation, unless after repetition for many times to help him to remember and benefit from the attitudes of learning so it is advisable to invest this positive feature of the deaf and mute persons and training them on motor skills to achieve excellence in performance (3). Also, (4) states that by depriving the individual from that feeling, we find that the deaf differs from the normal student in that the latter hears from his ears and speaks through the language of speech. The deaf student hears through his eyes and speaks through his hands. If we try to compensate the deaf student for losing communication in a way that is consistent with his disability, we must teach him sign language to improve his physical abilities, which will enable him to improve his performance. We could make him a normal person who can overcome disability (4). The researchers believe that the use of learning technology in physical education helps to develop the motor skills of deaf and mute students, the role of computers appears positively in the educational process in the field of sports, especially when designing visual education programs for the deaf and mute students provides them and the teacher great efforts to the learning mechanism also saves time and helps the learner understand the skill to be learned. The deaf and mute student depends on the sense of sight to compensate for his loss of hearing and speech. Within the limits of the researchers’ knowledge, such a study was not discussed in Iraqi society, which prompted the researchers to use the computer when teaching physical education at Al Amal School for Deaf and Mute in Maysan Governorate. Hence, appears the research problem of the effect of learning technology on some motor skills for the deaf and mute students.

Research Objectives:

1. Identify the effect of learning technology on the skills (kicking the fixed ball by foot, hitting the ball with the head, running with rolling ball, controlling the ball).
2. Identify the differences between the two dimensions of the experimental and control groups in the skills ((kicking the fixed ball by foot, hitting the ball with the head, running with rolling ball, controlling the ball).

Research Hypotheses

1. There are significant differences between the pre- and post-test of each group (experimental and control) in the level of skills (kicking the fixed ball by foot, hitting the ball with the head, running with rolling ball, controlling the ball).

2. There are significant differences between the two dimensions of each group (experimental and control) in the level of skills (kicking the fixed ball by foot, hitting the ball with the head, running with rolling ball, controlling the ball).

Methodology

Research Methodology: The researcher used the experimental method depending on two groups (experimental and control group) which corresponding to the nature of the research.

Research Sample & Population: The sample was chosen randomly from the community of (115) students from Al Amal School for the Deaf and Mute Students in Maysan Governorate for the academic year 2018-2019. 10 students were chosen for the exploratory study. (30) students of the research sample were divided into two groups (control and experimental) (15) students for each.

Data Collection Tools: 10 computers, data show, CDs, medical weight scale, stopwatch, football balls (5), equipment (5)

Basics of Program Development: Determine the learning skill to be learned in each unit. Identify the programs that apply in deaf and mute schools. Studying and identifying the aids for the skills learning process and the requirements needed during implementation. The process of follow-up for the application and the final evaluation of the program.

Program content: Kicking the ball with foot, hit the ball with the head, running with the ball, control the ball.

Program Development Steps: Identifying skills. Determine the physical preparation exercises that the learning technology program will contain. Identify the tools used in the learning technology program. Specify the time period for the tutorial (10) weeks. Determining the number of units per week. The researchers combined the unit time of the research group by 45 minutes, divided into 5 minutes warm up, 10 minutes physical preparation, 10 minutes observing the data by computer, 15 minutes of practical activity, The main part, (5) closing minutes.

Pre- measurement:

</table>

Tabular value (T) at level 0.05=2.089

The table shows the significant differences between the experimental and control groups in the motor skills test for the experimental group. The calculated value (t) is greater than the tabular value at the level (0.05).
Discussion

It is clear from the above that there is a significant difference between the pre and post-test of the experimental and control groups in the motor skills test according to the post test. The researchers refer these results to the positive effect of the learning technology in improving the motor skills (kicking the ball, hitting the ball with the head, controlling the ball). Computer is an appropriate tool for learning because it is a double-faced communication and interaction tool. The computer enables the learner to interact continuously and transfer it from success to success. This reassures the learner while learning and progressing with the program(6). The researchers attributed this progress to the positive role and effectiveness of the computer in the educational process in the field of sports when designing visual education programs as an educational tool for deaf and mute students that provides them and saves teacher’s time and effort during the learning process and helps the learner to understand and recognize the skills of football to be learned, where the deaf depends on the sense of vision With a great focus on learning to compensate for hearing loss. Computer is able to attract the attention of the learner and greatly stimulate his senses, and makes it in a state of permanent focus and good follow-up of colour images and bright colours and ease of operation and repetition, which makes the computer a typical medium of what is presented to him, and deafness depends on the sense of sight or means of visual communication (7).

Conclusion

1. The use of learning technology has a better positive effect than the way used by teachers for explaining the lessons of physical education for deaf and mute students.
2. The use of learning technology has a positive impact in learning the motor skills of deaf and mute students.

Recommendations:

1. Use of learning technology to teach the motor skills of deaf and mute students.
2. The need to provide preparation of computers and use them in the design of sports education programs before the lesson of physical education in schools deaf and mute students.
3. The need to hold training courses to improve the teachers of physical education in schools of deaf and mute students.

Abstract

The Indonesian government intensifies the prevention and control of anemia in adolescent girls and women of reproductive age by prioritizing the provision of iron folic acid (IFA) at schools. The highest anemia prevalence in Kalimantan Selatan Indonesia is in Banjarbaru City, the highest coverage of IFA administration in Guntung Manggis Public Health Center, many factors can cause anemia in adolescent girls. The purpose of this study was to analyze the relationship between compliance of IFA consumption, eating behavior, parental education, parental occupation, parental income, and counseling information from public health care provider with the incidence of anemia in an adolescent girl. This study used an observational analytic method with a cross-sectional approach. The population of this study is all adolescent girls in the junior high school research location. The sample was 94 respondents taken by proportional stratified random sampling. Data were analyzed based on the chi-square and logistic regression test. The chi-square test showed there was no relationship (p>0,05) between compliance of IFA consumption, eating behavior, parental education, parental occupation, parental income with the incidence of anemia in adolescent girls, while there was a relationship (p<0,05) between counseling information from public health care provider with the incidence of anemia in adolescent girls. Logistic regression test showed that the biggest variable related to the incidence of anemia in adolescent girls is counseling information from public health care provider (p<0,05).

Keywords: Anemia, adolescent girl, factor.

Introduction

The national program to accelerate nutritional improvement in Indonesia is prioritized in the prevention of anemia in adolescent girls and women of reproductive age (WUS). The results of Basic Health Research (Riskesdas) in 2013 showed that the prevalence of anemia in Indonesia reached 21.7%; female adolescents had the highest risk of anemia.1 Impact of anemia on female adolescents is to reduce body endurance, reduce fitness, and agility thinking (learning achievement). The impact of anemia who carried on until she becomes a pregnant woman results in an increased risk of stunted fetal growth (PJT), premature, low birth weight, stunting, pre, and postpartum bleeding, and increased risk of infant pain and death. The government then programmed the provision of iron folic acid (IFA) through school institutions for female adolescents and WUS which began in 2016.2 From 13 regencies/cities in Kalimantan Selatan, the highest number of female adolescents who experienced anemia was in Banjarbaru City, surely 705 female adolescents from 1200 examination samples, and the highest percentage of IFA coverage at the Guntung Manggis Public Health Center (87.247%).3 During the two years of IFA administration for female adolescents, there has never been an evaluation of post-consumption IFA so that the prevalence of adolescents with anemia is unknown. The purpose of this study was to analyze the relationship between compliance of IFA consumption, eating behavior, parental education, parental occupation,
parental income, and counseling information from public health care provider with the incidence of anemia in female adolescents in the Guntung Manggis Public Health Center working area, Banjarbaru City.

Materials and Method

This study used an observational analytic method with a cross-sectional approach. The population of this study was all female adolescents in the junior high school research location. The sample was 94 respondents taken by proportional stratified random sampling. Data collection used a questionnaire and measuring blood hemoglobin with univariate, bivariate, and multivariate analysis.

Results and Discussion

Univariate Analysis: A non-compliance of IFA consumption was very high (90.4%), eating behavior classified as sufficient (72.3%), last father’s education was high (58.5%), last maternal education was low (55.3%), respondents had working father (96.8%), unemployed mother (72.3%), low father income (54.3%), low maternal income (90.4%) and counseling information from public health care provider is good (77.7%).

Bivariate analysis: There was no relationship (p>0.05) between compliance of IFA consumption, eating behavior, parental education, parental occupation, parental income with the incidence of anemia in female adolescents, while there was a relationship (p<0.05) between counseling information from public health care provider with the incidence of anemia in female adolescents.

Counseling information from the public health care provider: The results of the study showed that counseling information from public health care provider was good (77.7%). Based on the chi-square test, it is known that there is a relationship between counseling information from public health care provider with the incidence of anemia in female adolescents p=0.014 (<0.05). The results of the study showed that the provision of counseling information from the public health care provider of the Guntung Manggis public health center was scheduled regularly every month. The provision of IFA through schools was done every three months when the activity takes place using the lecture method of the public health care provider explaining the procedure for drinking IFA, the impact, and benefits of consuming IFA through drinking instructions printed on the medicine tablet box. The provision of information about health can increase a person’s knowledge for better health behavior, increase knowledge about anemia prevention, so that information dissemination activities are indeed very important to do. Providing information about health can increase one’s knowledge to choose to consume food with balanced nutrition. Knowledge is a very important element for the formation of a person’s behavior, behavior based on knowledge is better than behavior that is not based on knowledge. A public health care provider is one of the driving factors for changes in a person’s behavior, the intensive information is given, the more behavioral changes will occur permanent.

Compliance of IFA consumption: The results showed that compliance of IFA consumption was only 9.6% and non-compliance was very high (90.4%). Based on the Chi-Square test, it is known that there is no correlation between compliance of IFA consumption with the incidence of anemia in female adolescents p=0.371 (>0.05). The administration of IFA was supplied at home resulted in its consumption not being effectively
controlled, besides IFA tablet that had a distinctive odor, taste and color and the appearance of post-consumption side effects such as nausea, dizziness, and black stools caused IFA to be discouraged.\textsuperscript{8,9,10} The results showed there were 9 respondents who regularly consumed IFA, but 2 of them are still experiencing anemia, this is because in addition to consuming IFA respondents also consume other ingredients that inhibit the absorption of iron into the body such as tea, coffee, and milk so that iron absorption is inhibited into the body.\textsuperscript{11} Anemia is also caused by other factors, such as chronic blood loss, inadequate iron absorption and increased iron demand during puberty, pregnancy, and lactation.\textsuperscript{12}

**Eating behavior:** The results showed that eating behavior was sufficient (72.3%). Based on the Chi-Square test, it is known that there is no relationship between eating behavior with the incidence of anemia in female adolescents $p=0.245 (>0.05)$. Out of the 68 respondents who had sufficient eating behavior there were 7 respondents (10.3%) who were anemic, as well as 26 respondents with insufficient eating behavior 5 respondents (19.2%) were anemic. This is because the absorption of iron in the body is influenced by reinforcing and inhibiting factors. One of the reinforcing factors is the consumption of vitamin C while the inhibiting factor is the habit of consuming ingredients such as phytic acid in cereals, oxalic acid in vegetables, tannins in tea and coffee, calcium in milk.\textsuperscript{11,12} Out of the 94 respondents, there were 85 respondents with the habit of consuming iron absorption in the form of tea, coffee and milk. This habit occurs because these types of food are commonly available both at home and school canteen, their lack of information and knowledge about the intake of substances that can inhibit and encourage the absorption of iron causes them to be unable to choose the right food to consume.

**Parental education:** The results showed that the last education of fathers was high (58.5%), and the last education of mothers was low (55.3%). Based on the chi-square test, it is known that the last father’s education is $p=0.539$ and the last maternal education is $p=0.692$ which means there is no correlation between parental education with the incidence of anemia in female adolescents ($p>0.05$). Out of the 55 respondents with the last father’s education high, there were 8 respondents (14.5%) who were anemic, out of 52 respondents with the last maternal education was low there were 6 respondents (11.5%) who were anemic so it could be concluded that parental education was not the main factor causes of anemia. Higher education will make it easier for someone to absorb health information, especially in the field of nutrition\textsuperscript{14}, but in forming a good health behavior there are many other factors that can influence, cultural factors are one of the strong factors related to the choice of dishes for families. The role of fathers as family leaders has great authority in making decisions relating to health and family.\textsuperscript{15} High levels of education but not accompanied by behavioral changes cannot change the nutritional condition of respondents because even though they receive sufficient information but if not implemented correctly in daily life - days cannot change a person’s health condition.

**Parental occupation:** The results showed that respondents with working fathers (96.8%) and mothers who did not work (72.3%). Based on the chi-square test, it is known that working fathers $p=0.501$ and unemployed mothers $p=0.825$, which means there is no correlation between parental occupation with the incidence of anemia in female adolescents ($p>0.05$). Out of the 26 respondents with working mothers there were 3 respondents (11.5%) who were anemic, out of the 68 respondents with unemployed mothers there were 9 respondents (13.2%) who were anemic, so it could be concluded that the parental occupation was not the main factor causing anemia. Work is closely related to income; if it is limited or uncertain, it affects the consumption of balanced nutrition in family members.\textsuperscript{16} In addition to socio-economic, the level of knowledge of maternal nutrition is also very influential, the higher the mother’s knowledge, the more positive the mother’s attitude towards food nutrition, so the better the consumption of energy, protein, and iron of her family and can avoid anemia.\textsuperscript{17}

**Parental income:** The results showed that respondents with low fathers income (54.3%) and low mothers income (90.4%). Based on the chi-square test, it is known that low fathers income $p=0.349$ and low mothers income $p=0.876$, which means there is no relationship between parental income with the incidence of anemia in female adolescents ($p>0.05$). Out of the 51 respondents with low fathers income there were 5 respondents (9.8%) who were anemic, out of 43 respondents with high fathers income there were 7 respondents (16.3%) who were anemic, so it could be concluded that parental income was not the main factor causing anemia. High and low income can be related to variations in the type of food purchased, but with good knowledge regarding anemia, it can be done in
the selection of iron source foods that are served to the family. Iron food sources do not have to be contained in the expensive food; utilizing local wisdom will be able to cut costs for family food supply.

**Conclusion**

There is no relationship between compliance of IFA consumption, eating behavior, parental education, parental occupation, parental income, with the incidence of anemia in female adolescents. There is a relationship between counseling information from public health care provider with the incidence of anemia in female adolescents.

The Prevalence of Tension Type Headache among Students of Baghdad College of Medicine in 2018

Aqeel Kareem Hatem1, FIBMS (Neurology), Zuhair A. Al-Johar2, Rand Abdul Jabbar Idrees3, Mariam Ahmed Khalaf3, Wasan Ahmed Shawket3

1Consultant Neurologist, Lecturer of Neurology, Department of Medicine, College of Medicine, University of Baghdad, Baghdad, Iraq, 2Specialist of Neurology, Lecturer of Neurology, Department of Medicine, College of Medicine, University of Baghdad, Iraq, 3Students at College of Medicine/University of Baghdad, 4th Year

Abstract

Objectives: The main goal of this study was to estimate the prevalence of Tension-type headache “TTH” among students of College of Medicine/University of Baghdad “CM/UB”; to compare its prevalence between males and females, and to decide on its relationship with years of study in college; to estimate the relative proportion of episodic to chronic subtypes of TTH; and to identify aggravating/relieving factors of TTH.

Method: A cross-sectional survey study was conducted from the 28th of July 2018 to the 14th of October 2018 on 150 students of CM/UB. The data were collected by using self-administered questionnaire which included demographic data and specific questions on headache based on international Headache Society criteria (ICHD-III) for diagnosis of TTH and other headache types.

Results: Of 150 participants, 86 (57.3%) had TTH: in 78 (52%) it was episodic while in only 8 (5.3%) it was chronic. Neither age nor year of study had a significant relationship with TTH, but there was a significant difference between genders with higher prevalence in females (65.3%) as compared to males (49.3%). Stress, sound and lack of sleep were the most common triggering factors, while rest and sleep are the most effective relieving factors.

Conclusion: TTH is common among students of CM/UB, being more in females, and mainly episodic. Its prevalence was comparable with results from medical schools in nearby countries.

Keywords: Headache, tension type headache, medical students, gender, Baghdad.

Introduction

Tension Type Headache “TTH” is the most common primary headache disorder in all age groups across the globe1. Several epidemiological studies have shown a high prevalence of headache among medical students. The prevalence rates of TTH have been reported in the range of (5.6-40.8%) in different countries2,3.

TTH leads to considerable disability with up to 60% of individuals reporting decreased work effectiveness, increased absenteeism and reduced social engagement4. TTH often begins during the teenage years, affecting three women to every two men5. It is frequent among medical students and shows significant impact on their personal and social lives and the students often claim that their symptoms had worsened since admission to the university6. Some studies showed that particular years of study in medical schools are associated more with TTH7, but this was not consistent among studies8. The relationship of gender with TTH in medical students was also variable across studies, some showed it to be more in females9, but some studies didn’t show that or even showed the opposite7,10.
The term “Tension Type Headache” has been chosen by the International Classification Headache Diagnosis I (ICHD I)\(^{11}\). International headache society divides TTH into episodic and chronic types based on the frequency of the attacks. Episodic TTH occurring on fewer than 15 days per month, is reported by more than 70% of some populations. It usually lasts a few hours, but can persist for several days. Chronic TTH, occurring on more than 15 days per month, affects 1-3% of adults. It can be unremitting and is much more disabling than episodic TTH\(^{12}\).

There are also conflicting reports on aggravating\/or alleviating factors of TTH, some affirming the role of stressors\(^{13-15}\), others negating it\(^{8}\). As the cause of TTH is still unknown\(^{16}\), epidemiological studies on specific populations are required to assist clinicians and researchers in finding the origin of pain and the factors influencing the frequency of headache\(^{7}\).

**Aim of the study:**
- Estimate life time prevalence of TTH among medical students of CM\(\cup UB\)
- Determine the association of TTH with gender, age and grade
- Estimate the proportion of chronic and episodic types of TTH
- Identify aggravating\/or relieving factors of TTH.

**Subjects and Method**

A cross sectional study was conducted among medical students of CM\(\cup UB\) from 28\(^{th}\) July 2018 to 14\(^{th}\) October 2018. The study was conducted in accordance with the Declaration of Helsinki, after approval from Medical Education unit of CM\(\cup UB\). This study enrolled 150 students who were selected randomly for the purpose of the study. The targeted Medical students were from 2\(^{nd}\), 3\(^{rd}\) & 4\(^{th}\) grade (year of study), for the age groups 18-23 years from either gender. Data were collected online using self-administered questionnaire. The questionnaire was designed by the researchers according to the international headache standards (IHS), and contained individual’s demographic information such as age, gender, grade and questions to identify the type of headache.

All subjects were classified by using 3rd edition of the International Classification of Headache Disorders “ICHD-3”\(^{17}\) to make the differential diagnosis between TTH, migraine and cluster headache according to the responses provided by the research subjects. And then we sub-classified TTH to episodic and chronic according to the frequency of the attacks.

**Statistical analysis:** All data were statistically analyzed by using the Statistical Package for the Social Sciences (SPSS) software (version 25) at level of significance (P ≤ 0.05) Descriptive statistics were presented in frequencies, percentages, standard deviations, and 95% confidence intervals.

The differences among groups were analyzed by using logistic regression model for showing the influence of the factors of age, gender, and grade on the type of the headache; and Chi-square method for differences in characteristics of headache, and by using z-test (for proportion) for differences in aggravating\/alleviating factors of headache.

**Finding:** There were 75 males and 75 females participating in this study which represent 50% and 50% respectively. The age of participants ranged between 18 and 23 years with a mean equaling 20.59 years ± standard deviation of 1.181 years (95% CI: 18.3-22.9). The mean age for males was 20.67 years +/- 1.277 standard deviation (95% CI: 18.2-23.2), while for females it was 20.51 +/- 1.073 standard deviation (95% CI: 18.4-22.6), both males and females age ranged from 18 to 23. The number of participants at the second stage were 58 (32 F, 26 M), at the third stage 47 (25 F, 22 M), and at the fourth stage 45 (24 F, 21 M).

The study showed that out of 150 students, 114 (76%) had headache, this was distributed as: 57.3% (n=86) had TTH, 16.7% (n=25) had migraine, 2% (n=3) had cluster headache and 24% (n=36) had no headache. The distribution of those per gender and age were calculated and depicted in Fig.(1,2) respectively.

**Figure 1:** Bar chart showing the distribution of gender per study groups in a sample 150 students of Baghdad medical college.
The descriptive statistics showed that the age of 86 students with TTH was distributed between 18 and 23 years with a mean of 20.52 years and standard deviation of ± 1.193 (95%CI [18.18-22.86]). Those were distributed as follows: 3 (3.6%); 13 (15.7%); 25 (30.1%); 28 (33.7%); 8 (9.6%); 6 (7.2%), per years of age (18 to 23) respectively; with 35 (40.7%); 29 (33.7%); 22 (25.6%) in 2nd, 3rd, and 4th grade respectively.

![Figure 2: Bar chart showing the distribution of age per study groups in a sample of 150 students of Baghdad medical college.](image)

Of 150 participant, 86 (57.3%) had TTH: 78 (52%) had episodic TTH and only 8 (5.3%) had chronic TTH of all 75 males: 37 (49.3%) had TTH, in 35 (46.7%) it was episodic and just in 2 (2.6%) it was chronic of all 75 females: 49 (65.3%) had TTH, in 43 (57.3%) it was episodic and just in 6 (8%) it was chronic. The percentages of episodic and chronic TTH per age were calculated and are depicted in Fig. (3).

![Figure 3: Bar chart showing percentage of types of TTH in relation to age in a sample of 86 students of Baghdad medical college with TTH.](image)

The results also showed that out of 114 participants with headache: 8.8% (n=10) occurred daily, 28.1% (n=32) occurred once a week, 35.1% (n=40) occurred more than once a week and 28.1% (n=32) occurred once a month. Regarding TTH: 8.1% occurred daily, 29.1% occurred once a week, 32.6% occurred more than once a week, and 30.2% occurred once a month.

Logistic regression model had been used to show the influence of age, gender and grade on the type of the headache, and to show the influence of these factors on TTH especially (Tab.1).

Discussion

This is the first study reporting the lifetime prevalence of headache and particularly TTH in CM/UB. The prevalence of headache in this study was 76% which is higher than what’s found in a study in Iran (58.7%)\(^7\) and much lower than a study conducted in Oman (98.3%)\(^10\), both of which were conducted on medical university students.

In the present study TTH was found to be common in medical students of CM/UB with the overall prevalence of 57.3%, which is in line with a number of studies on medical students that were conducted in Iran (44.2%)\(^7\), Turkey (50.7%)\(^18\) and Saudi Arabia (58%)\(^8\), as well as in Zagreb (57.69%)\(^9\), yet it is much higher than a study conducted in Iraq\(^19\) on the general population (21%), and also higher than the prevalence of TTH reported in the Middle East area (11-39%)\(^10,20-22\), which might signal a possible correlation between TTH and university study of medicine in Iraq.

In our study, TTH was more frequent than migraine (16.7%) and cluster (2%), in agreement with studies done in universities in nearby locations: Isfahan\(^7\) (44.2% TTH versus 14.2% migraine); Jordan\(^23\) (36.9% TTH versus 7.7% migraine); Zagreb\(^9\) (57.69% versus 8.86%); while in Oman\(^10\) both were equal (12.2%). However the last study\(^10\) contained a higher percentage of females in its sample (62.5%).

The generally believed higher prevalence rate of TTH among women, reflected by several studies, was observed in our sample with a prevalence of (65.3%) in females versus (49.3%) in males. This is in agreement with the findings of the study carried out in University of Zagreb Medical School (25.9% male, 70.1% female)\(^9\). However, some studies found no significant difference between male and female students like studies that are conducted in Isfahan\(^7\) (49.2% in males vs. 39.2% in females) and the one conducted in Oman\(^10\) (13.9% in males vs.11.1% in females)\(^10\).

In our study, grade showed no significant relationship with TTH, which comes in conflict with some studies like the study conducted in Isfahan which reported significant relationship with 3\(^rd\) year study\(^7\).

Several studies have reported the effect of age on different types of headache\(^24\). Considering the limited age range in this study; we did not observe any effect of age among sufferers from TTH, which agrees with the study in Isfahan\(^7\).

Regarding the types of TTH, our study showed that the prevalence of episodic TTH is 52% (46.7% of males; 57.3% of females) and prevalence of chronic TTH is 5.3% (2.6% of males; 8% of females), which comes in agreement with a global report\(^12\).

Among the factors affecting the intensification of tension headache, stress had the highest effect (93%), which conflicts with results of a study in Taibah University in Saudi Arabia on 3\(^rd\) year female medical students, which reports no relationship with stress\(^8\). However our results agrees with many prior studies on TTH in general\(^13-15\). Sound (phonophobia) intensified TTH in (54.7%) in our study and it was significantly different even from migraine group which also had phonophobia, this agrees with results of a prior study on the relationship of phonophobia with TTH\(^25\). Lack of sleep occurred in (50%) of students with TTH in our sample, which agree with prior studies on TTH in general\(^14,15\), however lack of sleep was significantly found to be more with migraine than TTH, which comes in agreement with prior studies\(^15\). Rest and sleep are the factors found in our study to be with the highest effect on relieving TTH by (72.1%) and (70.9%) respectively, coming in agreement with prior studies\(^13,14\) which agrees with what’s generally mentioned about TTH in various textbooks\(^26\), though this conflicted with another study\(^15\).

Conclusion

- TTH is common among medical students in CM/UB, being more in females, and mostly episodic.
- There is no significant association between TTH and age or year of study in CM/UB.
- Stress, sound and lack of sleep are the most common triggering factors, while rest and sleep are the most effective relieving factors.

Vasomotor Impact of Perivascular Adipose Tissue on Coronary Circulation

Abdulla A Ahmad¹, Hani M Almukhtar¹, Marwan M Merkhan¹

¹College of Pharmacy, University of Mosul, Mosul, Mosul, Iraq

Abstract

Research during the past decade has highlighted the functional role of perivascular adipose tissue (PVAT) in regulating the contractility of the underlying vascular smooth muscle cell layer. However, the mechanisms underlying these observations are not fully understood. PVAT has a protective role as it could induce vasorelaxation in different anatomical positions. However, there is a considerable evidence that the development and progression of coronary artery disease could be attributed to coronary PVAT. This review provides a comprehensive review of the vasomotor effect of PVAT that identifies the coronary PVAT as a necessary paracrine organ with a significant role in physiology and associated pathologies, and calls for basic cardiovascular research to solve this issue.

Keywords: Perivascular adipose tissue, coronary arteries, vascular tone, vasoconstriction, vasorelaxation.
adipokines. These molecules include hormones (such as adiponectin, leptin and sex steroids), inflammatory cytokines (for example, interleukin-1, interleukin-6, tumour necrosis factor-α (TNF-α)), other proteins (as angiotensinogen) and reactive oxygen species 6–8.

The substantial role of the endothelium in regulating the homeostasis of the underlying smooth muscle cell layer has become clear in recent decades. More recently, the concept of endocrine and paracrine role of the adipocytes is suggested in the vasoregulation as numerous adipokines have been identified to elicit haemodynamic effect 9,10. However, the impact of the adipokines is still obscure as they appear to have both advantageous and deleterious effects on vascular biology and pathophysiology 11.

**PVAT effect in regulation of vascular tone:** Based largely on the assumption that PVAT is an extraneous tissue, PVAT is routinely removed in vascular functional studies as it is supposed that PVAT even could impede the diffusion of exogenous molecules into the vascular tissue. The claim of the PVAT as a mere supportive structure was firstly denied by Soltis and Cassis (1991) who first described that PVAT could significantly attenuate vascular responsiveness of Sprague-Dawley rat aorta to noradrenaline 12. So the claim that the physical presence of PVAT could mechanically impede the diffusion of vasoactive substances, and subsequently the anti-contractile effect, was questioned.

To date, many studies have been performed in this field showed that PVAT has the ability to induce vasorelaxation 13,14. Subsequently, the term perivascular contractile factor was firstly introduced in the literature in 2007 15. In fact, what makes PVAT’s role in body homeostasis unique is the close proximity with the vessels. Although the exact mechanism of different adipose-derived relaxing and constricting factors (ADRFs and ADCFs) is yet to be identified, a number of potential PVAT-derived bioactive substances have been suggested to affect the vascular contractility, for instance, NO, hydrogen sulphide (H₂S), angiotensin 1-7, methyl palmitate, reactive oxygen species (ROS) and angiotensin II 5. Obviously, the majority of these substances are normally produced in physiological conditions and exacerbated during pathological status including inflammatory conditions 16.

**Signalling of coronary PVAT:** Coronary circulation has its own peculiarities, such as blood flow is mainly during cardiac diastole, and its regulation mainly by metabolites and not neural. In addition, coronary arteries are functionally end arteries so blockage of CA results in ischemia and infarction of the cardiac muscles supplied by artery 17.

Payne et al. have presented novel findings that highlight the potential detrimental role of PVAT in regulating vascular tone of coronary arteries. They demonstrated that perivascular adipose tissue could reduce endothelium-dependent dilatation of canine coronary arteries by impairing NO production 18. Then, the same group also published the first report which suggested PVAT-derived leptin as a potential contributor to coronary atherogenesis in metabolic syndrome. An increase in epicardial PVAT leptin aggravated coronary endothelial dysfunction in metabolic syndrome via a PKC-β-dependent pathway 4. Another study of coronary arteries from Ossabaw swine showed that PVAT could induce a contraction via activation of voltage-dependent ion channels, and attenuate H₂O₂-mediated vasorelaxation. In addition, PVAT was responsible for enhanced vasoconstriction of porcine coronary arteries in obesity 19. In line with this study, leptin was demonstrated to enhance coronary vasoconstriction and smooth muscle proliferation via a Rho-kinase-dependent pathway 20. The same group have shown that PVAT can attenuate vasodilation via inhibiting distinct subtypes of K⁺ channels in coronary smooth muscle of lean versus diet-induced obese pigs 21.

Chemerin was an another interesting adipokine identified firstly in PVAT around the rat aorta and superior mesenteric artery, and has the ability to contract the vessels 22. These findings are supported by Kostopoulos et al. (2014) who confirmed the expression of chemerin and its receptor CMKLR1 in human coronary artery, and PVAT. In addition, they found that chemerin is positively correlated with coronary atherosclerosis 23. In line with this study, the atherosclerosis in human aorta and coronary artery is positively correlated with the expression of chemerin in PVAT 24. These findings describe a new potential mechanism of how PVAT can modulate blood pressure and affect cardiovascular pathophysiology. Interestingly, elevated serum levels of chemerin have been reported in different cardiovascular diseases such as coronary artery diseases 25, hypertension 26, and preeclampsia 27. However, other adipokines in PVAT could balance or enhance the vasoconstrictor effects of chemerin, for instance, the chemerin:adiponectin ratio is considered as a predictor of metabolic syndrome 28.
In addition, our study which was conducted on porcine coronary arteries (PCA) showed that fresh PVAT could enhance porcine coronary arterial tone through the release of thromboxane and PGF$_{2\alpha}$. This study, for the first time, identified clear sex differences in the regulation of coronary artery tone by PVAT, with thromboxane has a role in PVAT-dependant vasoconstriction in females while PVAT-derived PGF$_{2\alpha}$ plays a role in the contraction of PCAs from males 20.

Reactive oxygen species (ROS) may play a role in bi-directional signaling between coronary artery PVAT and the vascular smooth muscle 30. This study is performed in individuals with type 2 diabetes and proposed this PVAT-vessel interaction as a novel therapeutic target for the prevention of vascular complications of type 2 diabetes. However, it is unknown whether the same signaling interaction is present in normal individuals. We have found that increased NADPH oxidase (Nox) expression and activity in PVAT may also influence the contractile effects on PVAT in the porcine coronary circulation during normal conditions (unpublished data). In addition, another study demonstrated resistin as an adipokine that reduces the endothelium-dependent and endothelium-independent vasorelaxation via increased superoxide radical production and decreased eNOS expression in porcine coronary artery 31.

**Pathophysiology of coronary PVAT:** It became increasingly clear that PVAT has a role in cardiovascular pathophysiology. In addition to its disadvantageous effect on the vascular tone, researches showed that pericoronary fat may act as a local risk factor for other cardiovascular pathologies, for instance, PVAT is associated with atherosclerosis in the coronary arteries 32. Furthermore, an apparent link has been found between an increase in PVAT and coronary artery disease 33. In fact, coronary PVAT exhibits a rather proinflammatory phenotype compared to the visceral and subcutaneous depots. Chatterjee et al. (2009) found that both human coronary PVAT and adipocytes secrete higher proinflammatory cytokines levels compared to visceral or subcutaneous depots 34. Interestingly, a recent study found that the phenotype of PVAT around internal thoracic artery (ITA) is closer to that of subcutaneous adipose tissue than that of PVAT around coronary artery, which may result from inherent variations in adipocytes 35. The authors concluded that the decreased atherosclerotic plaque burden in the internal thoracic artery could be due to the protection of ITA-PVAT from metaflammation and consecutive adipose tissue remodelling.

Additionally, Okamoto et al. (2001) showed that balloon overstretch injury could induce accumulation of neutrophils and macrophages in PVAT of porcine coronary arteries 36. The authors suggested that this accumulation could possibly occur through the release of cytokines and/or reactive oxygen species. This is supported by the findings of a recent study which showed that increased epicardial and PVAT are independent risk factors of cardiovascular diseases 37. The authors suggested evaluating the thickness of epicardial and perivascular adipose tissue (PVAT) and the adipokine-cytokine profile as possible model for the assessment of drug effectiveness in patients with coronary heart disease. Although we are still far from using PVAT as a potential local therapeutic target for controlling coronary artery tone, a recent study showed that a technique of non-invasive imaging for PVAT inflammation could be used to clarify the roles of PVAT in the presence and severity of vasospastic angina and the pathogenesis of coronary artery disease 38. In hypoxia, coronary arteries are relaxed to protect the heart from ischaemic damage via, at least partly, the generation of H$_2$S. Interestingly, a recent study showed that PVAT can augment hypoxic relaxation of coronary arteries through a mechanism involving H$_2$S and cystathionine-β-synthase 39.

Noteworthy, rodents were utilized commonly to study the function of PVAT in different anatomical positions, apart from coronary arteries due to the absence of PVAT around the coronary arteries of rodents. Conversely, the researches generally that studied coronary arterial PVAT were conducted on human or pigs, which are more representative to human than rodents. Although this is considered as advantageous point to the studies of the coronary arteries, the human studies particularly were conducted in pathological rather than physiological conditions as the human vessels used were from patients with severe coronary artery disease.

**Conclusion**

Whilst many studies showed the ‘good face’ of PVAT in inducing vasorelaxation in different anatomical regions (mainly aorta, mesenteric and internal thoracic arteries), studies on coronary arteries demonstrated the ‘bad face’ of PVAT, as one of the peculiarities of the coronary circulation, in that PVAT caused vasoconstriction. Our current knowledge about PVAT in coronary circulation can be potentially utilized therapeutically to target CAD. Future studies are required to evaluate the vasomotor signalling
substances/pathways that are originated from PVAT and regulate the vascular tone of the coronary arteries in both physiological and pathological conditions.

Anti-fungal Activity of Ginger Oil Against Aspergillus Fumigatus and Aspergillus Niger Causing Aspergillosis

Diyar Sagban Alwan

Ministry of higher Education & Scientific Research, University of Diyala, Iraq

Abstract

Aspergillosis is a common infectious disease causing many economic losses, especially poultry. Antibiotic resistance and infection recurrence attracted the researchers to find a safe and alternative anti-fungal substances instead of using the conventional antibiotics. In this work, anti-fungal activity of ginger oil in comparison to ketoconazole were evaluated against A. fumigatus and A. niger causing aspergillosis. The saxolite was used for extraction of ginger oil using n-hexan as organic solvent. Several treatments were used 5%, 10%, 15%, 20% and 25% in order to determine the minimum inhibitory concentration (MIC) ginger oil using the well diffusion assay. Ginger extract (15%) and ketoconazole (20%) were identified as the (MICs) against A. fumigatus. The diameter’s average of the fungal inhibition zones were 1, 3.1 and 5.2 cm when the ginger extract was used at 15%, 20%, and 25%, respectively. In addition, the diameter’s average of the Aspergillus inhibition zones were 0, 1.5, and 2.5 cm when 15%, 20%, and 25% of ketoconazole, respectively were applied. In regard to Aspergillus niger, our findings showed that 5% ginger extract was identified as the MIC. The diameter’s average of the fungal inhibition zones were 1, 3.2, 4.7, 6.2, and 7.7 cm when ginger extract was used at 5%, 10%, 15%, 20%, and 25%, respectively. Moreover, the diameter’s average of the Aspergillus inhibition zones were 0.9, 1.8, 3.3, 4.9, and 6.4 cm when 5%, 10%, 15%, 20%, and 25% ketoconazole, respectively were applied. No fungal inhibition was observed when 0% of antimicrobial agents, as negative control, was used. In comparison to ketoconazol, ginger extract had higher anti-fungal properties against the growth of A. fumigatus and A. niger. Because of its antifungal potential against isolated Aspergillus species, the author suggested ginger oil as a safe natural derived antimicrobial for treatment of aspergillosis.

Keywords: Aspergillosis, A. fumigatus, A. niger, ginger oil, ketoconazol, anti-fungal.

Introduction

Aspergillosis is one of the most common infectious disease affects both humans and animals, especially poultry, causing many economic losses. A. fumigatus and A. niger are the main causes of the infection. The infectious agents are opportunistic fungi, require only moisture and organic substances to grow. They widespread, almost everywhere; in the soil, water and air. These fungi possess a number of enzymes, which facilitate and maintain the balance of metabolic reactions. A. fumigatus species are associated with several health threatening and economic losses, especially when the infection is being an epidemic.

The risk factors of A. fumigatus and A. niger are represented by the production of ergot mycotoxins. These toxins cause a wide range of diseases ranging from allergic reactions to direct systematic injury such as, respiratory aspergillosis, when the respiratory system is the main portal of the fungi entry. After inhalation, a large number of fungal pores are transmitted through the upper respiratory tracts to the lungs. Then, the spores are vegetated and the fungal hypha are elongated (grown) as network, and eventually causing tissue destruction what allow the small size spores to penetrate the pulmonary vesicles. Several factors have been reported contributing to the development of the aspergillosis including; age, abuse of cortisone, HIV infection, malnutrition, smoking and high concentration of ammonia.

As eukaryotes, controlling of Aspergillus infection is still a challenge because of their structure and
metabolic processes are as same as in human, animal and plant. So, the antimicrobials that influence on the fungi growth could interfere with the normal physiological functions of the host cells. Many of anti-fungal agents are available but very few are without side effects\textsuperscript{10,22,23}. Antibiotic resistance and infection recurrence after treatment are motivating the researchers to find a safe and alternative anti-fungal agents instead of using the synthetic antibiotics which their dangerous side effects are known. Recently, the plant extracts and oils are non-toxic and biologically effective against a wide range of bacterial and fungal pathogens with no side effects on the humans or animals\textsuperscript{24-30}. This study comes to evaluating the anti-fungal activity of ginger oil in comparison to ketoconazole against \textit{A. fumigatus} and \textit{A. niger} causing aspergillosis.

**Material and Method**

**Samples Collection and Fungal Growth Conditions:** The fungi species, \textit{A. fumigatus} and \textit{A. niger} were isolated from infected poultry having aspergillosis. The samples were taken and processed, then fungal isolation at the microbiology Lab., Veterinary Medicine/ Diyala University. The czapke Dox agar was used for the isolation and identification of the \textit{Aspergillus} spp. After fungal inoculation into the culture media, the agar plates were incubated aerobically at 37°C for 24 hr. \textit{Aspergillus} isolates were kept into czapke Dox agar slants for spore formation in the refrigerator.

**Preparation of Stock Solutions of Ketoconazole:** The antibiotic, ketoconazole, was prepared in various concentrations. The stock solution 10 mg/ml was prepared by dissolving 50 mg of antibiotic into 5 ml of 100% DMSO and mixed well using the vortex mixer. A second dilution of ketoconazole 1 mg/ml was prepared by transferring 1ml from the first stock solution (10 mg/ml of antibiotic) into 9 ml of 100% DMSO and mixed well using the vortex mixer. All stock solutions were kept in the sealed vials at room temperature until they were used for preparation of other various dilutions.

**Preparation of ginger extract:** The sexolite were used for extraction of the soluble active compounds from ginger. In this work, the n-hexane was used as organic solvent. This assay was performed according to (31) with minor modifications. Briefly, 30 g of crushed ginger’s rhizomes was transferred into the extraction thumb of the sexolite. Then, 300 ml of n-hexane organic solvent were added and mixed with the crushed rhizomes and left for 10 hours. The produced extract was kept in the tightly closed tubes and its anti-fungal activity was evaluated against the tested pathogenic fungi; \textit{A. fumigatus} and \textit{A. niger} by antagonistic test.

**Preparation Dilutions of Antimicrobial Agents:** Several concentrations of ginger extracts and ketoconazole were prepared as following: 5%, 10%, 15%, 20%, and 25% in order to evaluate their antimicrobial activity against isolated \textit{Aspergillus} species. The concentrations were prepared based on the following equation:

\[
C_1 \times V_1 = C_2 \times V_2
\]

**Preparation of Fungi Spore Suspension:** Spores suspension was prepared by the addition of 5 ml of distilled water into the fungal spores, which were grown before onto the czapke Dox agar slants. By using a sterile brush, the fungal spores existed on the surface of agar slant were scratched, suspended in the water and collected in the sterile glass tubes.

**Antagonistic test:** Antagonistic assay was performed in order to evaluate the antimicrobial activity of ginger extract and ketoconazol against \textit{A. fumigatus} and \textit{A. niger} which were isolated from poultry aspergillosis. Briefly, the czapke Dox agar was prepared, sterilized by autoclave and 50 ml of the culture medium was transferred into 250 ml flasks. Before solidification of Czapk Dox agar, 1 ml of spore suspension was added to 50 ml of the culture medium and shaked well then poured into sterile petri-dishes. After solidification of agar, 8 mm wells were made and the antimicrobial substances with pre-determined concentrations were added. All agar plates were incubated aerobically for 24 hours at 37°C. After incubation, the diameters of the zones of the fungal inhibition were measured in millimeters using a digital caliper.

**Discussion**

The antimicrobial effect of ginger extract and ketoconazole against the growth of *Aspergillus fumigatus* was illustrated in Tables (1 and 2). Our data showed that 15% (T4) and 20% (T5) of ginger extract and ketoconazole, respectively were identified as the minimum inhibitory concentrations (MICs). The diameter’s average of the inhibition zones were 1, 3.1, and 5.2 cm when ginger extract was used at 15% (T4), 20% (T5), 25% (T6), respectively. In addition, The diameter’s average of the inhibition zones were 0, 1.5, and 2.5 cm when 15% (T4), 20% (T5), 25% (T6) of ketoconazole, respectively were applied. No inhibition zone was observed when the negative control (0% of antimicrobial agents) was used. The best antimicrobial activity of ginger extract and ketoconazole was noticed at 25% (T6) with which, the diameters’ average of the inhibition zones were 5.2 and 2.5 cm, respectively.

In regard to antimicrobial activity of ginger extract and ketoconazole against *Aspergillus niger*, our findings in Tables 3 and 4 showed that 5% (T2) of ginger extract was identified as the MIC. The antimicrobial activity was progressively increased with the concentrations of ginger extract. The highest concentrations were used, the lager anti-fungal activity was noticed. The diameter’s average of the fungal inhibition zones were 1, 3.2, 4.7, 6.2, and 7.7 cm when ginger extract was used at 5% (T2), 10% (T3), 15% (T4), 20% (T5), 25% (T6), respectively. Moreover, The diameter’s average of the inhibition zones were 0.9, 1.8, 3.3, 4.9, and 6.4 cm when 5% (T2), 10% (T3), 15% (T4), 20% (T5), and 25% (T6) of ketoconazole, respectively were applied. No fungal inhibition was observed when 0% of antimicrobial agents, as negative control, was used. The author suggested that the anti-fungal potential of ginger extract against *Aspergillus fumigatus* and *Aspergillus niger* is possibly because of the extract composition of several active compounds specifically, zingiberol, zigiberine, bisabolene, paradole, Gingerol33,34. Gingerol was reported as an acidifying agent which responsible for antimicrobial potential of ginger extract

In comparison to ketoconazol, the data in tables 5 and 6 showed that ginger extract had higher anti-fungal properties against the growth of *Aspergillus fumigatus* and *Aspergillus niger*. The virulence factors and cell wall properties of *Aspergillus fumigatus* make them more resistant to the tested antimicrobials than *Aspergillus niger*.36

Esthetic Utility and Stem Cell Implication with an Innovative Surgical Procedure

Abdullatif A. Aljuboury¹, Sinan S. Farhan²

¹Professor Doctor, Periodontal Surgery, Immunology, University Alfarahidi, College of Dentistry, Baghdad, Iraq, ²Lecturer, Anatomy and Surgery, Al-Rafidain University, Baghdad, Iraq

Abstract

Introduction: The classic therapeutic surgical procedure could not follow the upstanding new esthetic demands with the utility of stem cell. The aim is to show the clinical utility of an innovative surgical technique out coming both values, therapeutic and esthetic purposes with the activation and implication of stem cell.

Material and method: Five cases of human adult subjects have been operated with the innovative surgical procedure.

Results: Full coverage of the surgical field with new healthy gingival tissues.

Discussion: Tissue engineering using mesenchymal stem cells (MSCs) is a recent therapeutic modality that has several advantages. MSCs have high proliferation potential and may be manipulated to permit differentiation before being transplanted, suggesting they may be an ideal candidate for regenerative procedures. The regenerative therapy needed a specific regenerative technique that allow the genetic factors to play their roles in finishing the outcome of the surgery

Conclusion: This surgical technique showed to be clinically practicable with ability to activate gingival stem cells to achieve the specialization of the gingival tissues and giving a pleasant healthy protected clinical appearance as well it showed a faster healing process and less postoperative complications when a biologic glue (tissucol) applied as hemostasis and substitution material instead of traditional suture.

Keywords: Stem Cell, Gingiva, Esthetic Surgery, Tissucol, Hung-up suture.

Introduction

Since the fifties of last century a hundred of periodontal surgical techniques were provided and applied, mostly for therapeutic purposes, aimed to excise the over growth, regenerate the attachments or to maintain an acceptable dento-gingival relationship. Most of these basic techniques ended with a false successfulness or with some ugly gingival appearances. The scientist tried to inter artificial adjunctive substances, which are experimentally applied first, then commercially marketed in addition to its expensiveness, needs a high surgical skill in order to improve a successful attachment and reduction in depth of the true pockets. Regenerative treatment of periodontal damage is a demanding task, many chemical and biological material synthesized to create a favorable fibrous periodontal attachment and to fulfill the requirement of tissue building in addition to the appropriate flap technique. The application of regenerative materials must be save, ease to use and a biological origin. one of these material is the tissucol or tissue seal[1] which is derived from natural human fibrin and fibrinogen, able to replace the blood clot inside the pocket and as well the surgical field, it is a biological glue [1]. As we knew the thickness and amount of blood clots play a major role in wound healing [2] as it is thick as the healing time prolonged and increase possibility of epithelial invasion inside to give an unfavorable mixed attachment. The gingival cases almost without need an attachment of periodontal fibers but surely needs to repair the gingival unit fibers [3]. Not all cases of gingival problems could be treated with a single unique procedure when it is complicated with a biological defect e.g. genetic [4] and not all cases of gingival growth could be rottenly indicated for gingivectomy, some needs to establish a protective barrier to avoid a recurrence or worsen the case after a while. It requires respecting
the basic rules: 1- performance of high quality oral hygiene control. 2- To create a helpful dento-gingival relationship. 3- To maintain a healthy, pleasant, esthetic gingival appearance. 4- To eliminate as much as possible the anatomical defects that could be a risk for disease occurrence.

The aim of this study is to realize a clinical feature of the applicability and practicability of our innovative surgical procedure that gathers regeneration, creation of a protective ability and an esthetically acceptable appearance by activating and implicating the local stem cell of the surgical field.

**Material and method**

Young adult subjects have been chosen having a multifactorial gingival problem which could not match the indication of any known surgical technique.

**Case one:** Female, young adult, 18 years old, systemically healthy, complaining from gingival enlargement with absence of attached gingiva on lower anterior segment with difficulty on brushing with no bone loss.

**Case two:** Female, adult, 25 years old, systemically healthy, with gingival enlargement involving entire marginal, papillary and the insufficient narrow attached gingiva, extended up to alveolar mucosa and showing the impression of lips no bone loss.

**Case three:** Female, adult, 29 years old, systemically healthy, mal-aligned and mal-post teeth, gingival enlargement. Thin, narrow and loose attached gingiva. Shadow of alveolar bone is clinically visible, slight bone loss around the mal-post teeth.

**Case four:** Female, 31 years old, healthy, complete loss of attached gingiva, high lip lining attachment up to the gingival groove making a Diasthema-like, incisors diverged and drifted.

**Case five:** Female, 15 years old, healthy, crowded teeth, gingival growth covering half-length of teeth in arches, complete loss of attached gingiva of lower anterior segments, slight horizontal bone loss, high and long maxillary frenal attachment, ugly looking.

**Indications:** Narrow, insufficient or absent attached gingiva accompanied with gingival enlargement and associated with high frenal attachment that interfere or prevent proper oral hygiene control. When there where malty contraindications at once. Narrow attached gingiva, thin delicate attached gingiva, shallow vestibule, high Frenal attachment either all or partly gathered in case. When gingivectomy alone is contra indicated, also the apical replaced flap is contra indicated and frenectomy as well. When there is ugly alveolar buccal bone, visible root eminences, with bone shadow and possibility of future fenestration. When there is 2-3mm horizontal bone loss with gingival enlargement. Horizontal moderate and multiple gum recessions. For esthetic to remove the (Black gum), for creation a protective attached gingiva. And to facilitate personal home care.

**Technical Principles:** Customize the keratinized gingival tissues.

Internal beveled incision with variable angle degree depends on the gingival margin thickness to excise the lining and maintain the outer portion.

Both side vertical or oblique incisions extended deeply toward the base of vestibule.

Reflect Mucoperiosteal flap. The separation of the mucosal tissue must extend deeply up to the vestibular base.

Cut the muscular insertions around the surgical field. Remove the Frenal attachment completely.

Create deep enough horizontal groove in the bony wall (1mm depth) to stabilize the muscular fibers at the level of apical third of the roots. Create few holes perpendicular to the alveolar bone in between the roots to reach the cancellous bone to create bleeding points. Achieve root planning when needed, curate to remove the old attached gingival or periodontal fibers. Make the biological width around the teeth if necessary.
Osteoplastic step if necessary and bone crest remodeling if needed. Plane the expose roots and that of biologic width.

Make to position the old marginal gingiva at the base of the vestibule. Apply the tissucol (if available) by its special applicator to cover the entire surface area of the surgical field, introduce the solution in to the embrasures and to cover the cemento-enamel junction, it will set in minutes and act as hemostasis then apply a periodontal pack.

OR create a hung-up suture, make it loose, suspended around the present teeth.

Apply a suitable periodontal pack to adapt the flap and suture against the alveolar bone at the deepest point of the vestibule.

Results

All cases showed a suitable and healthy new gingival granulation tissue with a complete coverage of surgical field. The gingiva presented the anatomical characters of papillary, marginal and attaché gingiva. The tissucol acted as homeostasis, stopped bleeding in seconds after application, shortened the period of healing and reduces the post-operative complications and pain when compared with the hung-up stiches procedure. Clear and clean granulation tissues are created one week later.

Discussion

Recently the periodontal surgery doesn’t just for therapy of damaged supporting structures, but also for esthetic and to facilitate daily oral hygiene control even the underlying structures is intact.

Some cases are simply treated with routine techniques, other could be more complicated and multifactorial, and a unique indication could not be suitable to realize the basic rules. Any technique has indications and contra-indication, even they have been routinely copied from generations, still adding limitation in use to match the needed result. However, limited success of these applications, along with the morbidity generated by some of them, has led medical science to seek alternatives that use biologic mediators to solve biologic problems.

Wound healing or the regenerative process in a specific tissue requires a combination of fundamental events, such as appropriate levels and sequencing of regulatory signals, the presence and number of progenitor cells that respond to the reparative signal [5].

Tissue engineering using mesenchymal stem cells (MSCs) is a recent therapeutic modality that has several advantages [6]. MSCs have high proliferation potential and may be manipulated to permit differentiation before being transplanted, suggesting they may be an ideal candidate for regenerative procedures [7]. Precise identification of cells capable of regenerating the periodontium is valuable because no predictable regeneration procedure has yet been described [8]. (MSCs) have several advantages, These include high-quality regeneration of damaged tissues without forming fibrous tissue, cells capable of self-renewing at a high rate of proliferation, and differentiating into multiple cell lineages including mesodermal, endodermal, and ectodermal [9]. MSCs have been isolated from different oral tissues cells, periodontal ligament, and dental papilla derived cells and alveolar bone marrow [10]. Their participation in maintaining and repairing those tissues has been proposed. Thus, similarities with skin in structure and cell populations would hint that similar progenitor populations could exist in gingival connective tissue [11]. This idea is consistent with the oral tissues’ ability to repair without scars, reflected by
a minimal inflammatory response\textsuperscript{[12]}. Consequently, the identification and characterization of stem cells present in the gingiva tissue could give valuable information about the function and regenerative potential of this tissue to be applied in regenerative therapy \textsuperscript{[13]}. The regenerative therapy needed a specific regenerative technique that allow the genetic factors to play their roles in finishing the outcome of the surgery \textsuperscript{[14]}. Our innovative procedure appeared useful, practicable, giving excellent clinical result, able to create a suitable protective gingiva with functional and healthy dento-gingival relationship. Indeed it needs a high surgical skill of the operator. Healing taking normal duration in young-adult and adult subjects with two weeks packing. Stem cell activation and specialization looks great, creating attached, marginal and papillary gingival tissues.

Abstract

Based on maternal mortality data in South Kalimantan on years 2017 shown that the preeclampsia and eclampsia are leading causes of maternal and perinatal morbidity and mortality in South Kalimantan. From totals data of 75 death cases, preeclampsia and eclampsia have 19 cases, followed by pregnancy bleeding with 18 cases, 5 cases of infection and another causes 33 cases. The General Hospital Ulin Banjarmasin data about maternal mortality in the year 2017 showed that from a total of 13 cases, 6 cases were caused by preeclampsia and eclampsia. The total number of delivery in the General Hospital Ulin Banjarmasin 2017 was 1,505, founded about 251 incidences of preeclampsia with characteristics of 60% at term pregnancy, 32% over 35 years, primipara 24%, 9% obese. This research aim to analyze factors related to preeclampsia at Delivery Rooms in the General Hospital Ulin Banjarmasin on years 2017. This research is a quantitative study with a case-control research design to examine the factors that are related (independent variables) to preeclampsia cases in General Hospital Ulin Banjarmasin (dependent variable). The number of samples in this study was 95 cases and 95 controls with sampling techniques by simple random sampling. The results showed that there was a relationship between mother ages (p=0.011), gestational age (p=0.000), obesity (p=0.001), meanwhile parity factor showed no relationship (p=0.862). Whereas the dominant factor related to the incidence of preeclampsia in the delivery room at The General Hospital Ulin Banjarmasin was obese with OR=2.835. There is a relationship between mothers ages, gestational age, and obesity to the incidence of preeclampsia at Delivery Rooms in the General Hospital Ulin Banjarmasin in the years 2017. Nevertheless, the parity found no relationship. The dominant factor to the incidence of preeclampsia at Delivery Rooms in the General Hospital Ulin Banjarmasin in the years 2017 related to the obesity.

Keywords: Mothers ages, gestational age, obesity, parity, preeclampsia.

Introduction

Preeclampsia is the occurrence of specific hypertension in pregnancy, which involves various multi-organs in the body. It usually occurs in the week above 20 weeks’ gestation, sometimes appearing near the end of pregnancy and can also occur as superimposed preeclampsia due to a pre-existing state of hypertension.1 The frequency of preeclampsia in Indonesia around 3-10%, South Kalimantan in 2017 found data of pregnant women as much as 90,386 people with a high risk of 20%, namely people with a risk of pre-eclampsia as much as 47% of total risk pregnancies so that it ranks first of all risk factors there.2

The proportion of maternal deaths in Indonesia, namely bleeding reached 28%, pre-eclampsia by 24%, infection by 11%, complications of preeclampsia by 8%, long parturition of 5%, and abortion by 5%. Data from the South Kalimantan Provincial Health Office in 2017 The maternal mortality rate of 75 people with the highest cause was preeclampsia with 19 people, bleeding 18 people, infection with 5 people.3 General Hospital Ulin Banjarmasin in 2017 found maternal mortality rates of
13 cases, 6 of which were caused by pre-eclampsia and eclampsia or by 56% of 1,484 live births. So if converted into scale per 100,000 births, the maternal mortality rate is 600/100,000 live births.3

Risk factors for the incidence of preeclampsia include primipara (first pregnancy), previous history of pre-eclampsia, history of thrombophilia, systemic lupus erythematosus, age >40 years, parity (number of deliveries), gestational age (gestational age), obesity, diabetes mellitus, multiple pregnancies (multiple pregnancy) in vitro fertilization (IVF), chronic hypertension, kidney failure or both, a history of pre eclampsia in the family.1

Data of The General Hospital Ulin Banjarmasin in 2017 total patients in the VK maternity numbered 2387, childbirth 1.505 cases with preeclampsia of 251 (9.5%) of all patients in obstetrics and gynecology. The cases of preeclampsia ranked highest in ten obstetric cases, which were around 42%. Data on cases of preeclampsia in the General Hospital Ulin Banjarmasin, gestational age in aterm pregnancies (36 weeks to 42 weeks) is 60%, in preterm pregnancies (20 weeks to 35 weeks) is 40%, in women over 35 years of age is 32%, occurs in pregnancy first (primipara) is 24% in pregnancies that are more than two (multi-para) are only 14%, and obesity is 9%.4 Based on the data above, researchers need to research the risk factors for preeclampsia at the General Hospital Ulin Banjarmasin.

Materials and Method

This study used an analytic observational approach with case-control study design.6 The place of research was the delivery room of the General Hospital Ulin Banjarmasin. Time of study from March to May 2019. The population in the study were all pregnant, and childbirth mothers in the delivery room in General Hospital Ulin Banjarmasin in 2017 as many as 1,484 people, pregnancy and childbirth in preeclampsia were 251 people. Samples taken from the existing population are determined by purposive sampling, ie the research is determined by certain criteria determined based on the research objectives.7

Relationship between Age of Mother and Preeclampsia in VK Ulin Hospital Banjarmasin:
The blood circulation system is related to the elasticity of blood vessels where changes in blood volume will require good adaptation to blood vessels. Young people under 20 years old, children or adolescents up to 18 years the level of elasticity of blood vessels is still not mature or optimal. If at this age, a pregnancy occurs, efforts to adapt to changes in blood volume will have an impact on cardiac output. This event can be at risk of a failure of adaptation to the cardiovascular system so that as far as possible this age, pregnancy is prevented.7

Women aged >35 years are susceptible to the risk of chronic hypertension. Older women who show an increased incidence of chronic hypertension as they age, are at greater risk of developing preeclampsia. The incidence of preeclampsia can occur at all ages during pregnancy, but most are found at the age of ≥35 years because at this age with increasing age, degenerative diseases begin to appear.5,8 In hypertension, there is muscle tension near the spiral arteries and lumen spinal arteries, causing vasoconstriction; this fails arterispiral remodeling. Blood flow to the uteroplacenta will decrease and cause hypoxia and ischemia.5,9

Women at the optimal age of 20-35 years have an optimal circulation system in the heart so that they can carry out the pregnancy process properly and be able to adapt to changes in the blood circulation system. The risk of preeclampsia is almost doubled in pregnant women aged 40 years or more, both in the first pregnancy and in more than one pregnancy.10

Relationship of Parity (Number of Labor) Mothers with Preeclampsia in VK Ulin Hospital Banjarmasin: Primigravida pregnancy is a process of adaptation to the results of conception, in the normal state of the body there is a fetomaternal tolerance process so that the pregnancy can proceed well. The immune system has the task of recognizing and reacting to all foreign proteins that enter the body that is considered as foreign objects including the results of conception, then the reaction of fetomaternal intolerance has a high likelihood due to the incidence of preeclampsia in primigravida.

Primiparous pregnancy has an increased risk of preeclampsia, three times more likely than higher parity, whereas for multiparity only has a 1% chance of preeclampsia. It is estimated that the incidence of preeclampsia increases in nulliparity because the mother’s immune system still considers paternal cells to be antigenic and trigger the occurrence of desensitization resulting in preeclampsia. For newly married women with new husbands, the incidence of preeclampsia can increase, in addition to frequent sexual intercourse before pregnancy can reduce the incidence of preeclampsia.12

The immune system will recognize the results of conception in subsequent pregnancies so that paternal proteins that enter the trophoblast-shaped body are well tolerated. This fetomaternal tolerance will take place if the woman does not change partners, but if a new partner is present, the risk of the occurrence of preeclampsia persists even though it is more than one pregnancy.

Relationship between Gestation Age (Age of Pregnancy) and Preeclampsia in VK Ulin Hospital Banjarmasin: Preeclampsia cases of early preeclampsia are more dominant than late preeclampsia because gestational age associated with the incidence of preeclampsia is below 37 weeks, which means patients may have shown clinical symptoms since under 34 weeks (early onset).13,14 The last few years the distribution of preeclampsia is determined by a new concept, which is based on gestational age or gestational age, where this concept holds to gestational age when the clinical symptoms of preeclampsia occur. This classification is based on the onset of preeclampsia, namely early onset and late onset. Early onset is preeclampsia in pregnancy before or during gestation to 34 weeks, while late onset occurs in pregnancies over 34 weeks. This classification has been widely accepted that these two things are forms of preeclampsia that have different etiologies.15,16

The abnormal placenta is one that is thought to be the main pathophysiology in early preeclampsia while predisposing to cardiovascular or metabolic risk that causes endothelial damage and overreacting acts as pathophysiology in late preeclampsia. This difference has been supported by an analysis of pathological findings in the placenta and maternal factors that circulate.7,17

Relationship between Obesity and Preeclampsia in VK Ulin Hospital Banjarmasin: Obesity is closely related to insulin resistance, which is also a risk factor for preeclampsia. Obesity is one sign that leads to diabetes in pregnancy, where fibroblast growth levels correlate with fetal growth which is characterized by the presence of macrosomia and hyperplasentosis which increases the risk of preeclampsia.18 Increased blood and plasma cells
in pregnancy require increased cardiac output, as is the case with increasing BMI in obesity. Body compensation in obese pregnant women through hypervascularity for the fulfillment of placental blood circulation and hyperplasentosis is possible due to increased needs.19

Women who are overweight, obese, and unhealthy have a higher risk of developing slow-onset preeclampsia with severe conditions. When grouped according to gestational age at delivery, there is a statistically significant increased risk for the potential for late-onset preeclampsia at 34 weeks’ gestation. In obese women, twice the risk of preeclampsia compared to women with normal weight.20

The results of the study found a significant association between obesity and the incidence of preeclampsia (p <0.05) along with the results of the study, obesity is a risk factor for preeclampsia, the risk increases with higher maternal BMI.21 This increase the risk of preeclampsia by 2.47 fold, while women with a BMI >35 before becoming pregnant compared to BMI 19-27 had a fourfold risk.

a. Variable (s) entered on step 1: Age, Parity, Gestation, obesity

Conclusion

Based on the results of the study, there was a relationship between the age of the mother and the incidence of preeclampsia in the delivery room at Ulin Hospital Banjarmasin. There was no relationship between parity (number of deliveries) and the incidence of preeclampsia in the delivery room at Ulin Banjarmasin Hospital. There is a relationship between gestational age (gestational age) and the incidence of preeclampsia in the delivery room at Ulin Hospital Banjarmasin. There is a relationship between obesity and the incidence of preeclampsia in the delivery room at Ulin Hospital Banjarmasin. The most dominant factor associated with the incidence of preeclampsia in the maternity room at Ulin Hospital Banjarmasin is obesity.

Abstract

Background: Hyperchloremia is elevation of serum cholesterol level above normal (> 200 mg/dl). There are an association between cardiovascular diseases and high level of blood cholesterol. There are many risk factors of hypercholesterolemia as genetic, environmental, systematic disease as diabetes mellites and some drugs factors.

Subjects and method: A cross sectional study was conducted on adults who were attending Samara general hospital outpatients clinic during the period from 5th February-30th April 2017. The information regarding the problem and demographic characterestics of persons was obtained according to a questionnaire and the weight, height, blood pressure, total blood cholesterol level was recorded.

Results: The frequency of hypercholesterolemia among sample study was (54%). There is no significant association between frequency of hypercholesterolemia according to gender, age group, body mass index, family history and smoking habit but it has been reported that a significant association between high serum cholesterol and presence of hypertension, cardiac diseases and diabetes mellites.

Keywords: Hyperchloremia, Epidemiology, Samara.

Introduction

Hypercholesterolemia is defined as the presence of high levels of cholesterol in the blood (a form of hyperlipidemia) (1, 2). Normal serum level of cholesterol is < 200 mg/dl (< 5 mmol/l) and considered high (200 mg/dl and above) (3,4).

Cholesterol is manufactured by all animal cells. Steroid hormones and bile acid precursors are cholesterol. It is transported in blood plasma as lipoproteins which classified according to their density (very low, intermediate, low- and high-density lipoprotein (5).

It has been documented the relation between longstanding high serum cholesterol and atherosclerosis (6), these processes may lead to narrowing of affected arteries and may cause a clot which obstruct blood flow (7). There is a correlation between hypercholesterolemia and coronary heart disease (8) and it has been documented increase of risk five times than those with normal level of blood cholesterol (9).

The most important risk factors of hypercholesterolemia are a combination of environmental and genetic factors. Environmental factors include obesity, diet, and stress, diabetes mellites (8)and certain medications and other systematic diseases) (6). It has been found an association between high level of blood cholesterol and cigarette smoking, diabetes mellites and obesity (10). There is an effect of diet on blood cholesterol but the effect varies between individuals (11).

Patients and Methods

A descriptive study was conducted on adults attending outpatient clinic in Samra general hospital. The study started from 5th February-30th April 2017. The patients were sent for investigation of blood total...
cholesterol. The sample study individuals demographic information was obtained according to structured-designed questionnaire and by direct interview. The cholesterol level was considered high if it exceeds 200 mg/dl. Blood pressure, body weight, height, were measured in addition to obtain from patients investigation the total blood cholesterol level.

Statistical Analysis: By using SPSS 25.0 statistical software package the results were presented as the frequencies, per cent and Chi-square test was used to assess association. Statistical analysis at p-value < 0.05 was considered significant.

Results

It has been revealed that the frequency of hypercholesterolemia among study sample was 54% (Fig.1).

P value =0.04 - Significant association

**Discussion**

It has been documented in the current study that the frequency of serum hypercholesterolemia was (54%). This result is similar to result obtained by Al-Nozha et al in Saudi Arabia (12), and higher to that reported in Egypt (38% (13), and by other study done by WHO (36%) (14), in Kuwait (10.6%) (15), in Oman (15.6%) (16), in Sudan (7.8%) (17), in other studies in Saudia (32%) (18), in India (33.2%) (19), other studies (37%) (20), in Korea (1.2%) (21). The current result is lower than that reported in north Kerala in India the prevalence of hypercholesterolemia was 63.8% (22), in other studies (57%) (23), in Nigeria (62.5%) (24) and in Poland (66.4%) (25).

Regarding the gender in the sample study there are no differences in frequency of hypercholesterolemia between male and female (54%). This result is nearly to similar to that reported in Saudi Arabia (12). It is higher to that reported in Egypt (male 39.7%, female 38.3%) but there is no significant association (13) like other studies (26, 27). Other studies in India revealed that hypercholesterolemia is more frequent among female (67.6%) than male (57.6%) with a significant association(22).

In the current study the frequency of hypercholesterolemia was more frequent among age group more than 40 years (55.9%) and below age group below 40 years (48.7%) but there is no significant association (P value = 0.442). This result was nearly similar to that reported in Saudi Arabia (12), while in Egypt about (38.9%) above age 20 years and (38.7%) below 20 years without significant association (13).

In the current study the frequency of serum hypercholesterolemia is more frequent among persons with body mass index more than 25 Kg/M² (55.1%) than those with body mass index less than 25Kg/M² (51%) but there is no significant association (P value= 0.71). This result is nearly similar to result reported by Al-Nozha et al in Saudi Arabia (12). In India it has reported that about (69%) of those with body mass index more than 25Kg/M² having hypercholesterolemia and (59%) among those with normal weight (22) while in Egypt the result of hypercholesterolemia among those with high BMI and normal BMI was (48.8%,33.9%) respectively (13). Many studies reported that there are a significant association between obesity and hypercholesterolemia (28, 29, 30, 31).

In current study the frequency of hypercholesterolemia among patients with and without hypertension was (65.5%, 46.7% respectively) and among patients with and without cardiac disease was (87%, 48% respectively). Statistically, there is a high association (P value = 0.025 for hypertension and P value = 0.001 for cardiac diseases). This result is more than that reported in Fayoum in Egypt (frequency of hypercholesterolemia among hypertensive and non-hypertensives 54.5%, 36.8% respectively) and also there is a significant association (13). A significant relation was reported by hypercholesterolemia and high blood pressure by other studies (27,32).

There was a significant association between diabetes mellitus disease presence and hypercholesterolemia among study sample group (P= 0.04). The frequency of hypercholesterolemia in this study among diabetic and nondiabetic patients was (71.4%, 50%) respectively. This result is going with results of other studies.
which reveal that diabetes mellitus is one of causes of hypercholesterolemia and there are a strong association between them \(^{(8,10)}\).

**Conclusions**

The current study revealed that there are a significant association between hypercholesteremia and hypertension, cardiac diseases and diabetes mellites.

The Effect of Information, Expertise, and Supervision on the Obedience of Narcotics and Psychotherapy Reporting Officer

Erlina Syamsu1, Husaini2, Syamsul Arifin3, Roselina Panghiyangani4, Meitria Syahadatina Noor3

1 Banjarmasin Health Office, Kalimantan Selatan, Indonesia, 2 Master of Public Health Science, Faculty of Medicine, Lambung Mangkurat University, 3 Department of Public Health, Faculty of Medicine, Lambung Mangkurat University, 4 Department of Biomedicine, Faculty of Medicine, Lambung Mangkurat University

Abstract

Obedience can be influenced by several factors, including information, expertise, and supervision. This study aims to analyze the influence of information, expertise, and supervision on the obedience of narcotics and psychotropic reporting officers in pharmacy service units in Banjarmasin city. The method was an analytical observational study with cross-sectional study design. The sample was 102 respondents using simple random sampling method. The research instrument uses a questionnaire that has been tested for validity and reliability. Data analysis with descriptive and statistics, namely chi-square and multiple logistic regression. Respondents who have quality information will obey with psychotropic narcotics reporting (p=0.000). Respondents who have good skills (expert) will obey to psychotropic narcotics reporting (p=0.000). A respondent who has good supervision will obey to psychotropic narcotics reporting (p=0.005). The analysis using multiple logistic regression analysis showed variable information (p=0.001; Exp. B=6.993), expertise (p=0.012; Exp.B=4.691), and control (p=0.039; Exp.B=2.910) with 95%. There is the influence of information, expertise, and supervision on the obedience of narcotics and psychotropic reporting officers, with the most dominant variable is information.

Keywords: Information, expertise, supervision, obedience, report.

Introduction

Drug prevention cannot be separated from prevention, eradication, and supervision efforts. One form of supervision is the Narcotics and Psychotropic Reporting System Application (SIPNAP) which is developed and managed by the Directorate of Pharmaceutical Production and Distribution of Pharmaceuticals, the Ministry of Health of the Republic of Indonesia which aims to ensure the availability of Narcotics and Psychotropic for health services and/or the development of science and technology. Narcotics and Psychotropic Reporting is an obligation for pharmaceutical service units to the Head of District/City forward to the Head of the Provincial Health Service and Head of the Local Food and Drug Control Center online each month in accordance with the Regulations from Ministry of Health of the Republic of Indonesia number 3 of 2015 concerning circulation, storage, destruction and reporting of Narcotics, Psychotropics and Pharmaceutical Precursors.

According to a study by Milgram in 1963, obedience is one type of social behavior, where someone obeys and obeys the requests of others to do something because of an element of authority. Information is a significant factor in social influence. Sometimes someone wants to do something they do not want to do after they have been given some information; someone often influences others by giving them logical information or arguments about what they should do.

Expertise is specialized knowledge, training, and skills can also be a source of power. Someone submits to the expert and follows his advice because they believe that the knowledge of the ruler will help us achieve our goals. There is a significant relationship between
training variables and knowledge of SIPNAP reporting, so that information and expertise are crucial for a narcotics and psychotropic reporting officer. Narcotics and psychotic reporting is a form of supervision that aims to determine the use of narcotics and psychotropic drugs in the legal pathway and is very important as the International Narcotics Control Board (INCB) report so that it is known how much national consumption of narcotics and psychotropic drugs so that availability can be guaranteed for the benefit of health services and/or the development of science.

The study aims to find out the influence of information, expertise, and supervision on the obedience of narcotics and psychotropic reporting officers in pharmacy service units in Banjarmasin City.

Materials and Method

This study uses a tool or instrument in the form of a questionnaire modified by researchers from previous studies containing questions about the influence of information, expertise and supervision on the obedience of report reporting officers for narcotics and psychotropic drugs at the pharmaceutical service unit in Banjarmasin City. The independent variables examined and revealed through questionnaires included information, expertise, and supervision. While the dependent variable is obedience.

The population in this study were 142 pharmacists or pharmaceutical technical personnel who were assigned as narcotics and psychotropic reporting officers in pharmaceutical service units (pharmacies, IFK, IF clinics and IF hospitals) in Banjarmasin city that had reported narcotics reports and psychotropic drugs in the SIPNAP application from January to December 2017, with sample calculations based on the Lameshow formula, namely 92 people plus 9.2 (10%) so that there were 102 people and the method of sampling using a simple random sampling method.

Findings and Discussion

Effect of information on obedience: Based on the continuity correction test results with a confidence level of 95%, the p-value=0.000 is obtained so that the decision is Ho rejected (p<0.05) which means that information has a significant effect on the obedience of narcotics and psychotropic reporting officers. PR results of 4.182 (95% CI 1.980 - 8.831), which means that quality information produces obedience 4.182 times better than respondents with information that is not qualified.

Respondents who obeyed to make narcotics and psychotropic reporting as many as 52 people did indeed have information that was biased with a score range of> 24-40 as many as 46 people while six others had information that was not qualified of the 46 people (100%) who have quality information, there are 32 people (69.57%) who do have quality information with an average score of 36 while the other 14 people (30.43%) are the opposite. Based on the facts found in the field in this case because the 14 officers had to ask the clerk SIPNAP Banjarmasin City Health Office for delete and revise report that has been submitted due to an error in the listing on the stock card. Information is data that has been processed and can be felt by the recipient and has a real value, to make decisions now or in the future. Information systems are inseparable from input-process-output which is processed by the system so that it produces useful output. Partially information quality factors through relevant information indicators, information speed, and information consistency had a positive effect on Employee Work Effectiveness in the Health Resources Sector of the West Java Provincial Health Office. Likewise, information quality has a positive effect on information satisfaction with a p-value of 0.000 as well as other studies, which concluded that there was a difference in the quality of information before and after development (p=0.0001).

Effect of expertise on obedience: Based on the continuity correction test results with a confidence level of 95%, the p-value=0.000 is obtained so that the decision is Ho rejected (p<0.05) which means that expertise has a significant effect on the obedience of narcotics and psychotropic reporting officers. PR results of 4.297 (95% CI 1.889 - 9.773), which means that excellent expertise produces obedience 4.297 times better than respondents with inadequate expertise.

Respondents who obeyed to make narcotics and psychotropic reporting as many as 52 people did have excellent skills with a score range of>30-50 as many as 46 people while five others had inadequate expertise. Psychotropic reporting is a form of supervision that has a significant effect on the obedience of narcotics and psychotropic reporting officer. The dependent variable is obedience.

Information is data that has been processed and can be felt by the recipient and has a real value, to make decisions now or in the future. Information systems are inseparable from input-process-output which is processed by the system so that it produces useful output. Partly information quality factors through relevant information indicators, information speed, and information consistency had a positive effect on Employee Work Effectiveness in the Health Resources Sector of the West Java Provincial Health Office. Likewise, information quality has a positive effect on information satisfaction with a p-value of 0.000 as well as other studies, which concluded that there was a difference in the quality of information before and after development (p=0.0001).
SIPNAP reporting by operating a computer or laptop or smartphone. The skills possessed by someone will make skilled in doing specific skills. Expertise will make someone able to do something according to what has been taught. Training on reporting systems is essential, mainly if the reporting system is based on information technology (IT). There is a meaningful relationship between training variables and knowledge of reporting. With training, it will provide excellent expertise for officers. Knowledge, skills, hardware, software, LAN, and method related to management information systems (p <0.05). The number of operators in the pilot health center (e-Puskesmas) was categorized as lacking because it was not yet available in each service unit, 48 new people attended the training (80%). The application of applications and software has a significant influence on the dependent variable, namely the performance of the part of human resources with significance values of F and T below 0.05. The medical record information system had an effect on physician performance and from the results of the t-test.

**Effect of supervision on obedience:** Based on the continuity correction test results with a confidence level of 95%, the p-value = 0.005, then the decision is Ho rejected (p <0.05) which means that supervision has a significant effect on the obedience of narcotics and psychotropic reporting officers. PR results were 1.935 (95% CI 1.191 - 3.146), which means that proper supervision resulted in obedience 1.935 times better than respondents with inadequate supervision.

Respondents who obeyed to make narcotics and psychotropic reporting as many as 52 people did have proper supervision with a range of scores > 27-45 as many as 39 people while 13 others had inadequate supervision of the 39 (100%) people who have proper supervision, there are 25 people (64.10%) with proper supervision with an average score of 35 while the other 14 people (35.90%) are the opposite. Based on the facts found in the field, the 14 officers were rarely active in social media where online supervision was carried out by SIPNAP officers at the Banjarmasin City Health Office. Supervision is one of the factors that influence obedience. One of the apparent factors of obedience is the permanent presence or supervision of a researcher. If researchers leave the room and give their instructions over the telephone, obedience will decrease. There is an influence between supervision and obedience, the value of p=0.013. Likewise, direct supervision of the hospital leadership had an effect on the performance of nurses (28.62%), indirect supervision of the implementation of indirect supervision (13.32%), indirect influence of the implementation of supervision directly (15.97%), and the implementation of indirect supervision (15.97%).

**Effect of information, expertise, and supervision on obedience:** Information variable has a significant value of 0.001 with a wald value of 11.235 and a regression coefficient of 1.945. The significant value is <0.05 so that Ho is rejected or means that information has a significant partial effect on the obedience of narcotics and psychotropic reporting officers. The expertise variable has a significant value of 0.012, with a wald value of 6.251 and a regression coefficient of 1.546. The significant value is <0.05 so that Ho is rejected or means that expertise has a significant partial influence on the obedience of narcotics and psychotropic reporting officers. The supervision variable has a significant value of 0.039, with a wald value of 4.276 and a regression coefficient of 1.068. The significant value is < 0.05 so that Ho is rejected or means that supervision provides a significant partial effect on the obedience of narcotics and psychotropic reporting officers.

From the overall independent variable, the most dominant influence on obedience is the information variable (p=0.001) with a beta exponent value (Exp. B) of 6.993, which means that officers with quality information will have 6.993 obedience with officers with information that is not qualified.

Based on the results of the multivariate analysis of three independent variables, variable information is the most dominant variable who influence obedience with narcotics and psychotropic reporting officers. It is known that in total, respondents who are more obedient in reporting narcotics and psychotropic drugs (52 people) are more than respondents those who have excellent skills (47 people) are followed by respondents who have information that is difficult (46 people) and by respondents who have proper supervision (39 people). Based on the factual data, excellent expertise is more than quality information and proper supervision; this is because if the variable itself turns out the expertise that most influences obedience, meaning that without the interaction of quality information and proper supervision, expertise will be most affect obedience. Factually there is zero reporting that does not require data on information on narcotics and psychotropic use to be reported in SIPNAP reporting, and even without proper supervision, so that enough with officers who
have excellent expertise, the zero reports can be reported on SIPNAP reporting online. The findings in the field based on the characteristics of the respondents did show that the younger officers had excellent skills and conversely the older officers had inadequate expertise. However, if the three variables are tested together then the most dominant or most influential information on obedience because after being tested together it turns out that expertise and supervision encourage information to be the most influential factor in obedience with narcotics and psychotropic reporting in pharmacy service units in Banjarmasin city. Quality information is indeed the most dominant or very influential on obedience because based on the facts in the field there are indeed reporting officers who ask SIPNAP officers to delete or edit reports that have been sent and reporting officers will send back (repeat) so that the effect on obedience, in this case, is timeliness of delivery of reports of narcotics and psychotropic substances. If expertise can be improved with education and training, supervision can also be increased by internal and external supervision, but quality information is indeed required to be easily obtained, complete, thorough, suitable and timely and avoid recording errors on the stock card so that the physical goods and there is no difference in stock card. Be clear based on these exact reasons that cause quality information is the primary key of reporting narcotics and psychotropics so that information becomes the most dominant or most influential variable compared to other independent variables. Simultaneously, the Management Information System had a positive effect of 63.50% on the Work Effectiveness of Employees in the Field of Health Resources West Java Province Health Office. Likewise, the overall weighted average value of information quality before system development was 7.51 and after system development 21.87 with a difference of 14.36. The results of the statistical test also show p <0.05, which means there are differences in accessibility, completeness, clarity, speed, timeliness, and accuracy of information before and after system development. 

**Conclusion**

There is the influence of information, expertise, and supervision on the obedience of narcotics and psychotropic reporting officers, with the most dominant information variable among the three variables.

**Ethical Clearance:** This research has gone ethical feasibility testing by the Ethical Research Commission of the Faculty of Medicine, University of Lambung Mangkurat.

Effect of Some Factors and Variables on the Frequency-Time Distribution of the Otoacoustic Emissions

Adnan AL-Maamury¹, Dhifaf Ahmed²

¹Department of Medical Physics, College of Science, Al-Karkh University of Science, Baghdad, Iraq, ²Bilad Alrafidan University College, Baquba, Iraq

Abstract

The hearing process of the ear consists of two parts, the first part is related to the ear and its anatomy and the second part is related to the sound and its properties. Therefore, it is expected that there are a number of factors and variables, including those related to the ear, including sound related to the audio process. In this study, the effect of two of these factors on the otoacoustic emission is studied in general and in particular the frequency map. The relationship between frequency and quality factor is examined by changing the stimulus level.

Keywords: Hear process, frequency map, ear, stimulus level, sound.

Introduction

The hearing process is very important to human communication in individuals¹. Our auditory ability is due to the complex automated transmission that takes place within the inner ear that turns the waves caused by pressure into signals transmitted through the auditory nerve to the brain. Takes mechanical energy and produces electrical energy². The inner ear contains an amplification system that leads to the generation of sounds within the cochlea and is transformed into the ear canal through the middle ear. These sounds are known as otoacoustic emissions (OAEs). OAE are acoustic signals generated from within the inner ear, which can be recorded in the ear canal using a sensitive microphone³⁴. OAE are a consequence of the nonlinear and active pre-processing of sound in the cochlea³. OAE was first demonstrated by (David Kemp in 1978)⁵. Otoacoustic emissions have since been shown to arise through a number of different cellular and mechanical causes within the inner ear⁶,⁷. Studies have shown that OAEs disappear after the inner ear has been damaged, so OAEs are often used in the laboratory and clinic as a measure of inner ear health³.

OAEs have been used to explore the differences in the auditory system between sexes, with a number of studies suggesting that females have larger OAEs than males⁸,⁹. There are several evidence to suggest that the outer hair cells in the human ear are enhanced by the sensitivity of the cochlea and frequency selectivity¹⁰. The mechanical process resulting from the transmission of sound through the ear to the movement of the tympanic membrane causes the transfer of the wave in the cochlea fluids along the basilar membrane. Therefore, the outer hair cells on the basilar membrane are part of this. This active process is emitted from an incoming signal to the auditory nerve and the incoming signal travels back to the outer ear canal through the middle ear where it can be detected¹¹. Each part of the basilar membrane has a maximum sensitivity to the frequency closer to the characteristic oval window with higher frequencies, so the high frequency responses will have the shortest time to move back to the outer ear canal.

Otoacoustic emissions are measured by a probe placed in the ear canal containing microphone that records sounds in the external ear canal. TEOAE is brief acoustic stimulus with a wide frequency spectrum respond to a large part of the basilar membrane, the acoustic stimulus is used with the spectrum at a range of (1000- 4000 Hz)¹¹. At high frequencies, spectroscopy of the TEOAE response can reveal cochlear damage due to noise or toxic drugs of the ear¹²,¹³,¹⁴.

Method

We study here the otoacoustic emission of the ear using the nonlinear model by controlling two variables, the stimulus level and the quality factor, noting the effect of the factors on the distribution of frequency - time by studying a set of frequencies.
As in Adnan Al-Maamury (2018)(19), Adnan Al-Maamury (2015)(15) and Moleti et al. (2009)(17), we refer the nonlinear model is mathematically described as follows:

\[ \frac{\partial^2 P(x,0,t)}{\partial x^2} = \frac{2\rho}{H} \ddot{z}(x,t) \]  
\[ \ddot{z}(x,t) + \gamma_{bm}(x) \dot{z}(x,t) + \omega^2_{bm} z(x,t) = \frac{P(x,0,t)}{\rho_{bm}} \]  

In the above equations, the fluid density is denoted as \( \rho \), the BM surface density is \( \rho_{bm} \), BM transverse displacement at the longitudinal position is \( x \) and time is \( t \), and it is assumed that a cochlear duct of rectangular constant cross section of length \( L \) and half- height \( H \).

The dynamics of a passive oscillator driven by differential pressure is described by Equation (2).

The relation between longitudinal position \( x \), angular frequency and passive damping constant of the tonotopically resonant are set by Greenwood (1990)(18) as in Talmadge et al. (1998)(16).

\[ \omega_{bm}(x) = \omega_0 e^{-k_0 x} \]  
\[ \gamma_{bm}(x) = \gamma_0 e^{-k_1 x} + \gamma_1 \]

The quality factor is denoted as \( Q(x) \) and the local passive quality factor is defined as:

\[ Q(x) = \frac{\omega_{bm}(x)}{\gamma_{bm}(x)} \]

**Results and Discussion**

There are some factors and variables have a clear effect on the hearing mechanism of these factors, anatomy of the ear and nature, age and other related to the sound such as the stimulus level of the sound and the quality factor.

In this study, otoacoustic measurements of the ear were taken with two variables, namely the stimulus level and the quality factor to study the relationship between the auditory process represented by frequency - time distribution and the factors expected to affect the auditory process. This relationship was studied by a set of different frequencies (0.8227, 1.304, 2.067, 3.271, 4.134 and 5.197) KHz. The results of the research that obtained the of the otoacoustic emissions are presented in the form of steps and according to the selected frequencies, as follows:

**First step: the frequency (0.8227 KHz):** In this case, the otoacoustic emission is studied for a different set of quality factors (2, 4, 6, 8, 10, 1, 14, 16, 18 and 20). Different stimulus levels (30, 40, 50, 60, 70, 80 and 90) dB are used for each value of the quality factor.

According to this method, arithmetic sets show the frequency-time distribution, this distribution shows the relationship between frequency and time and according to the method, it will be clear that there are some differences in time due to the effect of changing the stimulus level and the quality factor.

Figure 1 shows all the information for frequency 0.8227 KHz where it contains seven different curves each curve showing the relationship between time and quality factor. It refers to a single stimulus level, so the number of curves equals the number of stimulus levels used in the computations. It is generally concerned with frequency 0.8227 KHz and all its information. It shows the frequency-time distribution and shows the relationship between time and the quality factor. It also gives information for the frequency-time relationship by changing the quality factor and the stimulus level.

![Figure (1) shows the relationship between the frequency 0.8227 KHz and other parameters](image-url)
Second step: the frequency (1.304 KHz): In this case and the following cases the same technique is used in the first step to study the otoacoustic emission. The same values of the coefficient of quality and intensity levels are used in calculations.

According the results, the frequency-time distribution shows the relationship between frequency and time and according to the method, it will be clear that there are some differences in time due to the effect of changing the stimulus level and the quality factor.

![Figure (2)](image2.png)

**Figure (2)** relationship between the frequency 1.304 KHz and other parameters

Third step: the frequency (2.067 KHz): In this case, Figure (3) shows all the information for frequency (2.067) KHz where it contains seven different curves each curve showing the relationship between time and quality factor. Each curve in the figure refers to a single stimulus level, so the number of curves equals the number of stimulus levels used in the computations. It is generally concerned with frequency (2.067) KHz and all its information. It shows the frequency-time distribution and shows the relationship between time and the quality factor. It also gives information for the frequency-time relationship by changing the quality factor and the stimulus level.

![Figure (3)](image3.png)

**Figure (3)** shows the relationship between the frequency 2.067 KHz and other parameters
Fourth step: the frequency (3.271 KHz): In this case, Figure (4) shows all the information for frequency (3.271 KHz) where it contains seven different curves each curve showing the relationship between time and quality factor. Each curve in the figure refers to a single stimulus level, so the number of curves equals the number of stimulus levels used in the computations. It is generally concerned with frequency (3.271 KHz) and all its information. It shows the frequency-time distribution and shows the relationship between time and the quality factor. It also gives information for the frequency-time relationship by changing the quality factor and the stimulus level.

![Figure 4](image1)

Figure (4) shows the relationship between the frequency 3.271 KHz and other parameters

Fifth step: the frequency (4.134 KHz): In this case the same technique is used to study the otoacoustic emission. According to this method, arithmetic sets show the frequency-time distribution, this distribution shows the relationship between frequency and time and according to the method, it will be clear that there are some differences in time due to the effect of changing the stimulus level and the quality factor.

![Figure 5](image2)

Figure (5) shows the relationship between the frequency 4.134 KHz and other parameters
Sixth step: the frequency (5.197 KHz): The last case does not differ from all previous cases in terms of calculations, taking into account the use of two parameters, the stimulus level and the quality factor. In the otoacoustic emissions calculations, the stimulus level is changed according to the values (30, 40, 50, 60, 70, 80 and 90) dB, at the same time, the value of the quality factor (Q) is changed according to the values (2, 4, 6, 8, 10, 12, 14, 16, 18 and 20).

According to this method, arithmetic sets show the frequency-time distribution, this distribution shows the relationship between frequency and time and according to the method, it will be clear that there are some differences in time due to the effect of changing the stimulus level and the quality factor.

Figure (6) shows all the information for frequency (5.197 KHz) where it contains seven different curves each curve showing the relationship between time and quality factor. Each curve in Fig. 6 refers to a single stimulus level, so the number of curves equals the number of stimulus levels used in the computations.

Finally, good information is available on the relationship between frequency, stimulus levels, quality factor and time for all cases.

![Figure (6) relationship between the frequency 5.197 KHz and other parameters](image)

Conclusion

It is concluded that the quality factor and stimulus levels have a clear vary effect on the otoacoustic emission. The behavior of the quality factor and its effect on the otoacoustic emissions is based on the low and high values and the effect is clear to the low values, this result is consistent with previous studies.\(^{19, 20}\)

In general we believe that there are some variables have an effect on the auditory process as an example of these influential factors and variables roughness, As roughness has an effect on other transactions and variables.\(^{21}\) As for the effect of the stimulus level, the behavior of the stimulus levels divided into two groups according to their effect on the otoacoustic emission, the first group is the low stimulus levels such as 30 dB and 40 dB and the second group is high stimulus levels such as 80 dB and 90 dB.

For low frequencies such as 0.822 KHz, it is observed that the effect of the stimulus levels is clear, as the low levels such as 30 dB are different from the high levels in terms of the time value of the otoacoustic emission as the change in time is greater.

The high stimulus levels such as 90 dB, the time of the otoacoustic emission ranges from 8 ms to 11ms for the quality factor values 2 to 20. While the time of the otoacoustic emission of the low levels ranges from 10 ms to 16 ms for the values 8 to 20 for the quality factor and similar to the high levels of values 2 to 8 for the quality factor, this situation is shared by a range of frequencies such as frequency 0.8227 KHz.

As for frequencies 1.304 KHz the effect exists but is different from the previous group, the stimulus levels effect is different for the quality factor values less than 8, while the values greater than 8 have almost the same
effect. The frequency 2.067 KHz is a characteristic frequency in terms of the behavior of the stimulus levels and their effect on the otoacoustic emission for all values of the quality factor. Through the results of all frequencies. For frequencies 4.134 KHz and 5.197 KHz, the change of time is from 9ms to 12ms for all levels and for almost all the values of the quality factor. According to the results obtained in this study, it is concluded that levels are classified into two categories, the first category is the low stimulus levels and the second category is the high stimulus levels. The quality factor in terms of its values is classified into two categories: the first category is the low values and the second category is the high values. The frequencies are classified into three categories: Class I is the low frequencies, Class II is the intermediate frequencies and Class III the high frequencies. Where the frequency 2.067 KHz is the best frequency in terms of systematic results.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Medical Physics, College of Science, Al-Karkh University of Science, Baghdad, Iraq and all experiments were carried out in accordance with approved guideline.

Abstract

In order to preclude relapse after the orthodontic treatment have been completed, majority of orthodontists depend on the permanent retention with bonded lingual retainer wires. It is essential to study the home dental bleaching effect on ions release from permanent retention wires with the increasing demand for bleaching to have gorgeous smile. Our vitro study intended to demonstrate the home dental bleaching gel (carbamide peroxide) effect on Nickel release from orthodontic fixed retainer wires, and how does the type of retainer wire, the carbamide peroxide concentration and the exposure duration effect of carbamide peroxide on the release of nickel ions. The sample was composed of 60 lingual retainer wires of two types (3 braided strands/orthotechnology, and 6 coaxial strands/orthotechnology) and two types of at-home bleaching gel (35% carbamide peroxide/opalescence PF/Ultradent, and 16% carbamide peroxide/polanight SDI). By using a brush, a thin coating of bleaching gel about 1-mm thickness was added onto one surface of the wire and kept for (30 minutes for 35% carbamide peroxide bleached wires and 90 minutes for 16% carbamide peroxide bleached wires -following the instructions of the manufacturer), for each kind of bleaching, after that the wires were bathed and kept at room temperature in 10 ml of artificial saliva in a wrapped container, for 7 days this process was repeated day-to-day. Via flameless atomic absorption spectrophotometer in ppm, nickel ions release was measured. Non significant differences were result between two types of wires and between 30% carbamide peroxide and control group, 16% carbamide peroxide showed significantly less Nickel release compared with control group and 35% carbamide peroxide group. Nickel release was not affected by the wire kind, but if may be affected by the carbamide peroxide concentration and the exposure time. The 16% carbamide peroxide documented the smallest values, that means the nickel release from retention wires was decreased as the exposure time increased to low carbamide peroxide concentration.

Keywords: Nickel Ions, Orthodontic Retention, Wires, Dental Bleaching.

Introduction

At the present time, many orthodontists suggested the non-extraction orthodontics that could be attributable to the use of particular innovative systems which can treat border line cases professionally to acquire attractive wide smile, young-looking facial profile with no extraction. After completion of orthodontic treatment, majority of those orthodontists depend on permanent retention with bonded lingual retainer wires for non-extraction cases talked about above (furthermore to treat spacing and median diastema cases) in order to avert relapse and to realize teeth position immovability after active orthodontic treatment. Furthermore, the self-assurance and social self-perception significantly affected by the color and appearance of the teeth (¹), and a lot of patients pursue tooth bleaching that can be accomplished in the office as well as, at home (²).

Home dental bleaching available as gel form, by at ray it applied on the teeth with an expectable volume of the bleach and can cover all teeth excellently extending to all lingual and interproximal surfaces. Therefore, many orthodontists favor it use in office to acquire persistent pleasing results (³).

The behavior of wire can be modified as the fixed retainer wire and bleaching gel come in contact with each other. And the increasing demand for bleaching after orthodontic treatment and since the white smile, its mandatory to estimate the available at home dental bleaching agents’ effect on ion release from
permanent retainer wires. In dentistry and specifically in orthodontics, nickel is used in a wide range of a material alloy such as: arch wires, bands, and brackets in these situation used in short time period around 2 years while in permeant wires it remain in oral cavity for several years or even decades \(^4\).

Allergic and sensitivity can be resulted from nickel \(^5\), and known as allergen immunologically \(^6\). 4.5-28.5% of individuals reported to have sensitivity from nickel \(^9\). The manufacture of fixed retainer wires is from Stainless steel alloy that comprises 8%-12% nickel, 17%-22% chromium and additional elements like: copper, iron, molybdenum, manganese, silicon and sulfur \(^7\). The wire is designed from three to six fine strands, and as an alternative to be plain round or rectangular wire, they were twisted as multistrands so as to increase mechanical retention and in principle the rate of Ni release of these wires might be dissimilar in comparison to straight plain wires \(^8\).

This study aimed to determine whether the home dental bleaching agents influence nickel release from fixed retainer wires and to afford evidence about the most appropriate dental home bleaching concentration and duration for patients with fixed retainers.

**Materials and Method**

The sample in our study included 60 lingual retainer wires of two types with 30 wires each:

1. 6-Strand (6S) stainless steel coaxial wire (Truforce, Orthotechnology).
2. 3-Strand (3S) stainless steel braided wire (Braided Retainer Wire, Orthotechnology).

Each kind classified into three groups: control group (C), 16% carbamide peroxide (polanight, SDI Australia) bleached group (B1) and 35% carbamide peroxide (Opalescence PF, Ultradent) bleached group (B2), 10 wires included in each group. A section of 22.0 mm in length was cutted from each sample wire and ligated through suture in such a way that the wire length can’t be affected and in order to simplify wire handling through day to day repeated procedure.

Before testing, with aceton, the samples were wiped and with ethanol cleaned ultrasonically for 1 min, rinsed with distilled water and dried out. A thin coating of bleaching gel about 1-mm thick was applied by brush onto the wire and left for 30 minutes, in the 35% carbamide peroxide bleached specimens (B1). However, in the 16% carbamide peroxide bleached group (B2), following the instructions of the manufacturer, the same procedure mentioned above was repeated except the time which was 90 minutes. For 7 days this procedure was repeated in order to simulate the instructions given to the patient daily, after each bleaching procedure, by running water the gel was washed for 10 seconds and in 10 ml synthetic saliva in a closed container at room temperature, the wires were stored as they ligated by suture to keep them suspended in the synthetic saliva from all around. Figure 1

![Figure 1: Samples stored in artificial saliva.](image)

The synthetic saliva mentioned above (The electrolytic media) comprised of: - 0.7g NaCl, 1.2g KCl, 0.26g Na2HPO\(_4\), 0.2g K2HPO\(_4\), 1.5g NaHCO\(_3\), 0.33g KSCN, 0.13g urea and 1000 ml deionized water, the saliva PH adjusted to 6.7 ± 0.10 via the pH-meter, to be similar to that of human saliva \(^9\), and that was used as the testing solution.

We removed the wires from the solution, at the day of the test and the measurement of Nickel ions release was done by flameless atomic absorption spectrophotometer (AA-6800 SHIMADZU/graphite furnace). Figure 2

The results analysis was made by two-way ANOVA test and further by pairwise comparisons.

![Figure 2: Flameless atomic absorption spectrophotometer (AA-6800 SHIMADZU/graphite furnace)](image)
**Results**

Non-significant differences between the wire types (3S and 6S) and significant differences between bleaching types was revealed by Two-way ANOVA test. The pairwise comparison show the significant difference between bleaching type due to the significant differences between the control group and 16% carbamide peroxide (B2) and between the 35% carbamide peroxide (B1) and (B2) in each type of retainer wires.

![Image of Nickel release from fixed retainer wires groups measured in ppm]

**Discussion**

The ion release from diverse metallic dental products after they exposed to oral environment that may influence their corrosion vulnerability and result in ion release from them was studied by several earlier studies (10, 11).

Currently it is very essential to evaluate the biocompatibility of frequently used metallic alloy in the oral environment and how corrosion and ion release from the alloy can be affected by this alteration, consequently may influence the durability of this metallic part of the appliance or result in allergic reaction at vulnerable patients. Owing to long duration of orthodontic treatment and retention, this topic revenue a distinctive importance. Retention after orthodontic treatment may takes years or even permanently, it is important to know how dental bleaching agents comprising peroxides influence stainless steel fixed retainer wires with the increasing patients’ requirements for attractive smile and white, well aligned teeth. In patients that have sensitivity to nickel, dental alloys with elevated nickel content should not be used(10).

In 1994 Bour and his coworkers (12) proposed that cytotoxic response can be resulted from a threshold concentration of about 30 ppm of Ni. Extended contact of orthodontic appliances can cause local pain and swelling in the neighboring tissues and the subsequent corrosion products (13), the additional described side effects are edema, gingivitis, gingival hyperplasia, DNA instability and alteration in cellular metabolism (14). Loss of substance from the material, alteration in its structural features, or loss of structural integrity can be resulted from corrosion. Various forms of electrochemical corrosions can ensue in the oral cavity, attributable to the salivary electrolytic capabilities. One of the factors that can influence this process is dental bleaching thus this study intended to evaluate whether Nickel release from stainless steel fixed retainer wires is affected by the commercially available at-home bleaching agents. The result of tour study revealed non-significant difference between control group (mean= 27.77 for 3S and 28.75 for 6S) and opalescence 35% carbamide peroxide (B1) of two types of fixed retainer wires (mean= 28.45 for 3S and 30.67 for 6S), significant difference only seen between control group wires and polanight 16% carbamide peroxide group (B2) (mean=12.17 for 3S and 9.42 for 6S) and between B1 and B2 groups with less mean values scored for B2 group. Non-significant difference was seen between two types of wires in all groups this agree with Milheiro and his coworkers (15).

The reaction rate and oxygen release of carbamide peroxide tissue surfaces was established to be much slower, mainly at oral and room temperatures. It was demonstrated that carbamide peroxide is greatly effective in reduction of plaque buildup and caries incidence. Furthermore, it has been tested to treat oral candidiasis in neonates. Its efficacy was established with no any adverse effects. Since Nickel release from stainless steel reaches its highest level after 7 days, in our study the immersion time in artificial saliva was not exceeded one-week (16).

Peroxides is the chief constituent of at-home bleaching agent commercially accessible, that can cause corrosion in variable degree to stainless steel in 2011 Sharma and Kumar determined that with the increased concentration of peroxides its corrosivity
increases. Moreover, the stainless steel alloy used in orthodontic wires can be affected by peroxides concentration from slight influence in low concentration to slight corrosion at higher concentrations [25]. Current study presented a non-significant difference between control groups and B1 groups, this may be because of carbamide peroxide stability and short application time of opulence 35% carbamide peroxide which was 30 minutes, in comparison to control group this time may be inadequate for production of more nickel release. On the other hand, B2 group was significantly lower than control group to realize that it is imperative to know stainless steel behavior in response to variable peroxides concentrations [17].

According to Johnson Diversity [18] stainless steel can be protected from corrosion connected with ion loss once it is freshly fabricated by: initially, treatment and cleaning with nitric acid in order to eliminate free iron from the surface then on this surface, passive layer formed gradually and naturally as chromium oxide resulted from the reaction between the chromium at the surface and oxygen in the air. The term passive refers to steel now being ‘unreactive’. During passivation, the thin oxide layer, that has produced at the metal surface, makes the surface non-reactive to hydrogen peroxide and averts the metal form putrefying the peroxide [19]. In 2014 while reviewing the oxide coating steadiness at stainless steel surface of medical implants Naoun and his coworkers [20] said: this coating is quite essential for protection of medical implants, chemical agents such as hydrogen peroxide can alter its attitude. When used medical implants go through different phases in which hydrogen peroxide is involved [20].

Miyazawa and his coworkers [21] studied the hydrogen peroxide influences on stainless steel corrosion and determined that; as $\text{H}_2\text{O}_2$ reduced from 100 to 10 ppb, the oxide film thickness first increased and then it diminished. This meant that thin oxide film causes large dissolution rate and vice versa and give explanation about the less Nickel ions loss of fixed retainer wire in our study at low peroxide concentration which may be because of thick oxide film growing on the wire that may cause less reactivity in the wire as it immersed in synthetic saliva and consequently less Nickle release in B2 groups. The safety and serviceability of new products and procedures received great attentions by researcher as the dentistry goes to be more aesthetic in recent times. Narrow studies accomplished about durability of permanent retention wires in the oral cavity under variable environments, in this area Milheiro and his coworkers [15] studied the action and PH of mechanical loading on Nickle release from retention wires and established that resilient consequence on the Ni release from orthodontic retention wires caused by mechanical loading and in comparison to acidity mechanical loading has less impact on Ni release.

With the emergence of new systems and tendencies inspire non-extraction treatment in orthodontics, permanent retention with fixed retainer wires lingually or palatally used nowadays more than before. The wire serviceability in the oral cavity could be affected by to different influences and conditions wires as stay in the oral cavity for a long period or permanently. Because of overall tendencies toward perfect smile by patients particularly after completion of orthodontic treatment, teeth whitening and bleaching is exceedingly required recently, this leads to the question whether bleaching safe in a permanently retained orthodontic cases and what are the available option of dental bleaching could be used in this cases.

Our study focused on this area of research. Results estimate that some of the at- home dental bleaching agent can be used safely in patient wearing fixed retainer, further studies needed in this field to evaluate other dental bleaching options and their influences on permanent retention wires.

Conclusions

Generally speaking, in a patient with fixed retainer wire tested at-home dental bleaching agent can be used safely. Type of retention wire haven’t any effect on Ni release, although carbamide peroxide concentration and exposure time can influence Nickel release with the 16% carbamide peroxide recorded the smallest values that means increasing time exposure to low concentration carbamide peroxide, nickel release from retention wires reduced.

Parental Responsiveness of Mindest-Based Nursing on Early Sexual Education to Prevent Child Sexual Abuse

Elok Permatasari, Kuntoro, Shrimarti R. Devy, Wiwin Hendriani

1Student of Doctoral Program of Public Health, Public Health Faculty, University of Airlangga East Java Province, Indonesia, 2Lecture of Public Health Faculty, University of Airlangga Surabaya, East Java Province, Indonesia, 3Lecture of Psychology Faculty, University of Airlangga Surabaya, East Java Province, Indonesia

Abstract

Parents need to emotionally engage and spend more time with the child as a response to the child’s psychological needs. One study explains that the parental response (both father and mother), in the form of support to the child, is a potential factor as a protection against the incidence of sexual abuse in children. One of the preventions through parenting that can be done by parents is to provide appropriate and correct sexual education in accordance with early child growth and development. Explanatory research was conducted to 170 pairs of parents (170 fathers and 170 mothers) from early child (aged 3-6 years) in Jember. The results show that parents’ mindset about sexual education has an important contribution to shape parenting skills, especially in preventing children from the risk of sexual abuse (sig = 0.000). Most parents feel that it is not easy to convey sexuality information, but they have a positive understanding of the role of early sexual education as an effort to prevent child sexual abuse. The main obstacles are on how to convey the child sexual education and to trust the early child to be self-reliant in taking a stand on the conditions at risk. It is important for parents to change the mindset that early child has the ability to learn and protect children from sexual abuse through early sexual education in day-to-day care.

Keywords: Child sexual abuse, early sexual education, parenting.

Introduction

Indonesia is in an emergency condition of sexual abuse according to the Indonesian Child Protection Commission. This is because the number of sexual abuse in Indonesia is quite high. The cases reached 1001 in 2015, and dramatically increased to 1424 cases in 2017. The victims of child sexual abuse were 73% more likely than adults. The vast majority of victims of sexual abuse are male (60%) with cases of sexual abuse in the form of sodomy (54%).

Early child (aged 3 - 6 years), based on the concept of Freud’s psychosexual development, is in the phallic phase. This phase is a phase in which children begin to have an interest in their genitals, as well as sex differences. This phase is an important phase for parents to raise caring awareness to teach and protect against the risk of sexual abuse in children. Sexual experience is a natural part of the developmental stage of children that allows children to learn to understand their bodies and the rules that shape sexual behavior are not at risk in children in the future.

Sexual abuse often occurs in families with low support and harmony. Family support in this case is the response or concern of parents in meeting the needs of children, especially in an effort to prevent sexual abuse in children. Another study explains the same thing, that sexual abuse in early child occurs due to risk factors from people closest, especially parents. It was explained that ineffective parenting process became the originator of vulnerable early child victims of sexual abuse. Parents have a function as educator and protector for children of early age. This is because early child (3-6 years) should spend most of his time with parents. Children not yet entering regular schooling interact more with the primary environment, especially parents. The family has a primary/primary role in preventing child sexual abuse. In principle, each family has great potential to teach children how to deal with child abuse.

The concept of parenting based on the perspective of Baumrind Theory explains that there are two parenting dimensions that parents have in applying parenting to children. The dimensions of parenting include
responsiveness and demandingness. Responsiveness refers to the extent to which parents deliberately provide encouragement or motivation by adjusting, supporting, and approving the needs and demands of children. Important aspects of responsiveness include warmth, reciprocity, clear communication, and individual-centered discourse, and attachment \(^9\). This study was conducted to analyze the responsiveness dimensions of parents of early child especially in the effort to prevent sexual abuse in early child. Parental support shows a strong connection to child feelings of security as a responsive form of nurturance \(^10\). Previous research has shown that fathers are better able to identify KSA signals than mothers, since fathers are more likely to be suspicious of strangers \(^11\).

Based on their ability to grow up, children of three can effectively be taught self-protection skills especially from the risk of sexual abuse. Parent and family involvement in training is important, and repeated exposure helps children retain their knowledge and understanding of prevention efforts \(^12\). Another study also explains that families who communicate effectively with children do not report cases of sexual abuse occurring in their children, whereas inadequately communicating parents report some form of sexual abuse experienced by their children \(^7\).

Characteristics of parents in care will contribute to the interpretation of sex and sexual education for early child as a form of prevention of sexual abuse in children. The parent mindset will affect knowledge, belief, value, and attitude \(^13\). Talks about sexuality and prevention of sexual harassment between parents and children, in many studies are still hampered by cultural factors and beliefs. When parents want to talk to their children about preventing sexual abuse, many feel that they lack the skills or language to do so \(^14\).

The mindset which often inhibits parents of early child in providing early sexual education as a form of parental response in care to prevent sexual abuse occurs in their children. Based on this background, this study aims to analyze the four indicators of the dimension of responsiveness in parenting with the parental mindset in providing sexual education in early child as a form of prevention of sexual abuse.

**Material and Method**

This research is an explanatory research that aims to emphasize to find picture of causality among several sub variable of research through hypothesis testing. This study aims to analyze the dimensions of responsiveness in the care of parents’ mindset about early sexual education in an effort to prevent child sexual abuse. The subjects of this study are parents of children of this age (3-6 years) who live in urban areas in Jember. The sample in this study amounted to 170 pairs of parents (170 fathers and 170 mothers) taken by simple random sampling from 10 kindergartens in the urban area of Jember.

The dimensions of parental responsiveness were measured using a parental response skill questionnaire of 24 questions covering 4 responsiveness indicators: 1) self-esteem of early child; 2) Effective communication between parents and young children; 3) Support to establish self-reliance in children and 4) Form of affection given to children. Parental mindset of early sexual education was measured using a gender-based mindset scale questionnaire consisting of 24 questions covering 3 indicators: 1) belief (belief about the impact of early sexual education on sexual prevention); 2) value (assessment of the provision of sexual education in early child) and 3) parental attitudes in the role of educator in parenting.

**Findings**

**Respondents’ Characteristics:** Most of the maternal respondents in the study were aged 26-35 years (66%). The education level of most mothers is high school graduation (38.2%), and most mothers work as housewives (45.9%).

While the respondents’ father, most aged 31-35 years (34.1%). Similar to maternal respondents, most fathers have senior high school graduates (42.4%) with employment as self-employed or private sector employees (75.3%).

Most of these parents have 5-year-olds (40%) with male sex (51.8%).

The parents’ mindset in this case is related to the parental mindset about the importance of providing early child sexual education to early child. The mindset will contribute to the concept of providing sexual education in early child. The results show that most parents have a good mindset (52.94%) about the importance of early sexual education to prevent child sexual abuse. Mother has a higher mean mindset score (mean = 76.85) than the father’s mean score on the importance of sexual education in early child.

Based on the three indicators of mindset, it is known that belief scores of parents’ beliefs about the positive and negative impact of giving sexual education in early child have the highest mean score (mean = 28.15) compared to other indicators. Parents are more convinced that sexual education will be able to protect their daughters from the risk of sexual abuse. The weakness in the mindset is related to attitudes in applying the provision of sexual education for fathers and mothers to early child. This is shown from the lowest average attitudinal value (mean = 21.98) compared to other indicators.

</table>
Based on the results of the tabulation of research data, it shows that most parents have good response skills in either category (90%). The mean maternal skill response (mean = 87.31) is better than the father’s response skills (mean = 84.20) in preventing sexual abuse in early child.

</tbody>
</table>

Based on four indicators of response, the average value of mother majority is higher than the father. Parents have a good response especially on indicators of giving love to young children (mean = 22.04). The weakest parental response ability based on the four indicators of responsiveness is in terms of effective communication with early child (mean = 20.63). Most parents find it easier to communicate openly and positively to girls than boys (84.15%).

**Parental Mindset on Early Sexual Education to Parental Response Skill in Daily Parenting:** The results of statistical analysis using linear regression showed significant parental mindset influence on early sexual education on parental response skills to prevent sexual abuse in early child (p-value = 0.000). The results of this analysis are also supported by the results of multivariate analysis showing the same value (p-value = 0.00) that the mindset contributes to the formation of parenting response skills in care, especially in the prevention of sexual abuse in early child. Indicators that play an important role in this case are the value (value) and attitudes (attitude) parents about the importance of giving sexual abuse in girls and boys.

**Discussion**

In particular, the parental mindset about early child sexual education is built on beliefs, values and attitudes (13). Most mothers feel it is important to take sexual abuse precautions with education in early child, but most of them are just beginning to provide sexual education when the child age turns to 4-6. Most mothers are not yet confident to provide sexual education to younger children even though they believe that sexual education is important for children (15).

Morally, children are entitled to receive the necessary support and information that they will need to make responsible decisions regarding sex and sexuality (16). The results of the study illustrate that most parents already have a good sense of the importance of early sexual education. Early sexual education is believed to be the majority of respondents as a protective factor in the incidence of sexual abuse in children of this age. Their obstacles in applying the parenting is about how to convey the message of preventing sexual abuse with appropriate language and in accordance with early child development.

Improving the ability of parents to communicate expectations and values about sexuality can help support children in making sound decisions about sexual behavior as adolescents (17). The lowest average score indicates that parents often do not provide balanced education to boys and girls. Based on the results of the study conducted in Garwita Institute Jember, the existence of patrilineal culture in Jember causes differences in the provision of sexual education in boys and girls. More parents feel the need to communicate intensively with their daughters compared to boys. This is because they are more confident that their son has better knowledge so there is no need for too many parental exceptions (18).

Parents can try to communicate at different times with their children, often the topic is started by their children, including when driving in the car, at dinner, and bedtime (19). Effective communication with young children is light and fun communication using positive, easy-to-understand languages. Not by using language or information that is frightening, especially when discussing information prevention of sexual abuse in children.
Conclusion

Parental mindset about early sexual education is an important focus in developing parenting skills in preventing child sexual abuse. Knowledge gained by parents through information from the media and the parenting education process held in Kindergarten is not enough to help improve parenting skills, if the parent mindset is still curative in the sense that their children are not at risk of becoming victims of violence sexual. So often there is a change of care done if their children have been victims of sexual abuse\(^{(20)}\). The findings in this study can be used as a recommendation that effective prevention of sexual abuse by involving parents not only by providing education to increase parental understanding about the risk of sexual abuse in early child. However, there should be the needs to be deeper and sustainable efforts to change parental mindset of curative thinking into preventive thinking for continuous effective parenting as an effort to prevent sexual abuse in early child.

Microbiological Diagnosis of Bacteria Isolated from Otitis Media

Eman Mohammed Tahir¹, Hadeel Abdulhadi Omear¹, Nada Khalil Yaseen²

¹Collage of Science-Biology-Tikrit University, Tirit, Iraq, ²Collage of Medicine-Tikrit University, Tikrit, Iraq

Abstract

Otitis media is an infection or inflammation in the part or whole of the mucous membrane of the middle ear cleft; it is amongst the most common diseases associated with multiple microbial pathogens within the middle ear and has worldwide distribution, particularly among children. The current study was conducted to investigate the bacterial causes of Otitis Media (acute and chronic). The swabs were collected from patients (n=105) suffering from ear discharge (Otitis Media, acute or chronic) (42 males and 63 females) referred to Salah Al-Din teaching hospital (ENT department) under the supervision of otolaryngologist to avoid any possible contamination during the period from July to December 2018. The ages of the patients ranged between (8 months to 80 years). Bacterial culture was done in regular conditions and biochemical tests were done by using commercial media. Bacterial cultures were positive in 93.3%, while 6.6% patients revealed negative in culture. The most common bacteria isolate included *Pseudomonas aerogenosa* followed by *Staphylococcus aureus*.

Keywords: Otitis Media, P. aerogenosa, S. aurous, Biochemical tests, Bacterial cultures.

Introduction

Otitis Media is a poly-microbial multifactorial disease, which is an inflammation of the middle ear that outcomes in the middle ear effusion, irritability, fever, and infection of tympanic membrane¹, it is one of the most common problems in the progressing world², and is continues to be one of the commonest childhood diseases and linked with multi microbial pathogens inside the middle ear³. Precedent studies⁴-⁹ have reported otitis media to possess worldwide propagation, it might result from bacteria, fungi and virus¹⁰. It considered as the most common respiratory tract infection of babyhood and early childhood¹¹. The more horizontal Eustachian tube and is shorter in children allows the microorganisms to enter from the nasopharynx to middle ear⁴. Otitis media may be classified as acute or chronic followed by suppurative or non-suppurative. It may be named as “specific Otitis media” has been utilized to explain tuberculosis and syphilitic otitis media as it may presence of acutely or chronically, with or without purulence and it may namely “adhesive otitis media” has been utilized to describe tympanosclerosis (hyaline degeneration and calcification) and adhesion construction within the tympanic cavity but should be further carefully be regarded as a complication of otitis media¹². It occurs in both gender and at different ages and varying estimates and the children less than the age of Ten years are often more susceptible to the injury, especially whose visiting the public swimming pools, kindergarten and nursery¹³. The etiologic bacteria in otitis media may be aerobic as (*P. aerogenosa*, *S. aureus*, *Proteus mirabilis*, *Streptococcus pyogens*, *E. coli*, *Klebsiella spp.*) or anaerobic as (*Peptostreptococcus*, *Propionibacterium*, *Bacteroides*)⁹,¹⁴. In current study, in acute otitis media, *S. aureus* was predominant organism isolated from middle ear; while the most common microorganism found in Chronic suppurative otitis media is *P. aerogenosa*¹⁴. Many studies have indicated that the source of G+ bacteria that causes otitis media is nasopharyngeal cavity, and the source of G- bacteria I auditory canal contamination¹⁵. Acute otitis media can cause pain which lead to sleeplessness for both parents and child, and also can cause perforation in the eardrum, in up to 97% of children with ASOM; pathogenic bacteria have been isolated from the nasopharynx¹. If severe infection

goes untreated long enough, high fever can occur and cause febrile seizures. The aim of the present study is to determine the pattern of bacteria isolates in patients with Acute Suppurative Otitis Media (ASOM) or Chronic Suppurative Otitis Media (CSOM) by microbiological culture, and biochemical Method.

**Material and Method**

**Clinical specimens and patient data:** Clinical specimens and data were collected from 105 patients with ASOM or CSOM who was visit Salah Al-Din teaching hospital (ENT department) under the supervision of otolaryngologist to avoid any possible contamination, these samples collected during the period from July to December 2018. All samples kept in disposable transport media to maintain the vitality of microorganisms until the specimens are processed.

**Identification of Bacteria:** All samples were inoculated on culture media viz. MacConkey agar plate, blood base agar plate, chocolate agar plate. The inoculated MacConkey and Blood agar plates were incubated aerobically at 37°C for 24 hours. After incubation they were examined for evidence of growth. The colony characters were studied by staining with gram stains kit, and examined under the 100x objective. The bacterial species, then isolated were identified by morphology, characteristic of culture, and biochemical test according to the standard techniques16-17.

**Isolation of Staphylococcus aureus:** S. aureus was inoculated onto Nutrient broth at 37°C for 24 hours then streaked onto Mannitol Salt agar to confirm identified due to this agar contain highly salt (7.5%), and S. aureus tolerant high salt as well as its able to ferment mannitol sugar. Plates are incubated aerobically at 37°C for 24 hours and examined after 24 h for yellow colony surrounded by halo zone incubated aerobically at 37°C for 24 hours and examined after 24 h for yellow colony surrounded by halo zone18. Catalase and coagulase test were performed to confirmation of result. This bacteria positive for catalase and coagulase tests. API 20 Staph kit was used to confirm the diagnosis.

**Isolation of gram negative bacteria:** All gram negative bacteria were inoculated onto nutrient broth at 37°C for 24h and then streaked onto MacConkey agar media19, and identified by using biochemical tests and API 20 E. The tests were read after incubation at 37°C for (24-48) hours18.

**Biochemical tests:** Various tests were carried out on gram negative bacteria (Indole, Methyl red, Vogas- Proskauer, Citrate, Urease, Kligler Iron agar, Catalase, Oxidase tests). All biochemical tests were done according to MacFaddin20. All isolates of P. aerogenosawere sub- culturing on cetrimide agar plate, which contain antibiotic inhabited growth of other gram negative bacteria.

**Results and Discussion**

In this study, the female was seen more susceptible to infection with otitis media than the male (59/98: 60.20%) (39/98: 39.79%), this result was agreeing with Ekpo et al.27 who found the male to female ratio was 1:16, but dis-agreed with some reports12,22. Other study in South Africa found that the male was more susceptible (64%) than the female (36%) to infect with otitis media26. The most common age group affected was (26-30) years (18.36%) followed by (21-25%) years (15.30%), (0-5) years (13.26%), and (6-10) years (12.24%). This result similar to Patigaroo et al.28 who found the most our patients were young and middle-aged, and Gul et al.,24 who refer to the most common age group more susceptible to infection with otitis media was (21-30) (22%), but disagreed with Ayub et al.12 that found children more susceptible to infection (Table 1).

1. Bacteria Isolates from Acute Otitis Media:

In the present study, the results showed that the S. aureus was predominant organism isolated.
from middle ear, which reached (9/25) (36%), were confirmed by Gram’s Method, catalase and coagulase tests followed by *Pseudomonas aerogenosa* (7/25) (28%). The third most common organism in this study was coagulase negative *S. epidermidis* were (5/25) (20%) as shown in Figure 1. Mixed growth was present in 1 sample. This results identified according to microbiological and biochemical and API tests. The results were agree with previous reports\(^21,25,26\) that identified 35 isolate of *S. aureus*, and dis-agree with Ch.Al-Yas\(^22\) that found *S. aureus* in only 6 isolates, and with Ayub et al.\(^12\) that detect *S. aureus* in 5% of isolates. As well as the results of present study are quite contrast to results\(^25\), which was the most common isolates was *Streptococcus spp.* (47.74%) followed by *Moraxella spp.* (23.84%). All isolates of *S. aureus* were appear to be capable to ferment mannitol when culturing on Mannitol Salt agar medium and the media turned into yellow color as it shows in Figure 2.

![Figure 1](image1.png)

**Figure 1**: Distribution of pathogenic bacteria [ASOM]

2. **Bacteria Isolates from Chronic Otitis Media:**
Out of 78 ear swabs cultured, 73 (93.58%) had bacterial growth. Amongst these, the most common pathogenic species were *Pseudomonas aerogenosa* (29/73) (39.72%), were identified by produce some greenish pigmentation on MacConkey agar medium and also gave fishy odour. Strongly oxidase positive was confirmed *P. aerogenosa*. followed by *P. aerogenosa*, *Staph. Aureus*, which was observed in (26/73) (35.6%) cases, as shown in Figure (2), this result was similar to\(^17,21,24,25\), but was dis-agreed with\(^3,25,23,28\) which they found that the most common isolates are *S. aureus*. Mixed growth was observed in 4 samples, this result was agree with\(^25\) which found that 3 samples (3.44%) of no growth, 3 samples (3.44%) of mixed growth, and 81 samples (39.1%) positive growth of single bacteria. Some studies showed that the source of infection in otitis media were enteric bacteria and *P. aerogenosa* is not needful to be the nasopharyngeal rout but may be through contamination of fecal of the auditory stream\(^29\). Another study refers to another way helps transfer pathogens to middle ear is to use incorrect Method for cleaning the external ear\(^30\). All isolates of *P. aerogenosawere* appear to be able to growth on Cetrime agar and produce Blue-green color due to production of pyocyanin pigment as it shown in Figure 4.

4. Diagnosis of G- bacteria by using API 20 E: API 20 E kit was used to confirmed diagnosis for G-bacteria, Figure 3 showing the result of 3 type of G-bacteria (Acinetobacter baumanii, Citrobacter freundii, Proteus volgaris).

![Figure 3: Diagnosis G-bacteria by using API-20 E system](image)

Diagnosis is done according to manufacturer’s instructions (Biomerieux) according to (15).

5. Biochemical tests of Staphylococcus spp.: S. aureus showed positive results with coagulase, catalase, mannitol fermentation, urease test, β-hemolysis and methyl red (MR) test. It showed negative results with oxidase and vogues proskauer test. However, S. epidermidis showed positive results only with catalase.

6. Diagnosis of G+ bacteria by using API Staph: API Staph. kit was used to confirmed diagnosis for G+ bacteria, a single pure colony cultured aerobically on Mannitol Salt agar or blood agar medium for 18-24hr was transferred to the test tube which contained 5 ml of normal saline, Mixed by using the mixer (perfectly). An inoculation box (Tray and Lid) was prepared by distributing 5ml of sterile distilled water to the wells of the tray to provide the humidity for bacterial growth. The tray was incubated at 35°-37°C for 18-24 hour. After the incubation period was finished, the following reagents were added (VP, NIT, PAL), after 10 minutes, the results were reading.

![Figure 4: Diagnosis of S. aureus by using API-20 staph system](image)

Diagnosis is done according to manufacturer’s instructions (Biomerieux) according to (15).

Ethical Clearance: The blood was collected from the Al-Karkh Materity hospital after their investigation. Oral consent was taken before enrolled the patients in the study.

The Relationship Between Family Support and Family Burden Towards Readmission

Erma Erfiana1, Meri Neherta2, Netrida3

1Master Program of Nursing Faculty of Nursing Andalas University, Limau Manis, Padang, West Sumatera, Indonesia, 2The Relationship between Family Support and Family Burden towards Readmission, 3Master Program in Nursing of Nursing Faculty of Andalas University

Abstract

The number of readmission of psychiatric patients in Padang, West Sumatera, is still very high. This is due to some factors such as the family support and family burden in taking care of the family members with mental disorder that are not good enough. Meanwhile, the Readmission itself can increase the finance and the service quality of the psychiatric hospital. The purpose of this study was to know the relationship between family support and family burden towards the readmission of psychiatric patients at HB Sa’anin Padang Psychiatric Hospital. This study was analytic descriptive with cross-sectional study approach. The sample of this study was 106 respondents. This study used purposive sampling technique based on the inclusion criteria in which the family did the readmission < 1 month or ≥ 1 month at HB Sa’anin Padang Psychiatric Hospital. To collect the data, the researcher used family support and family burden questionnaire. To analyze the data, the researcher used Logistic Regression. The researcher found that there was a significant relationship between family support and family burden towards the readmission (p value <0.05) in which the most dominant variable was the family burden towards readmission. The inadequate family support in taking care of family members with mental disorder would have an impact on patients’ healthcare at home. Ideally, family should become the source of support for family members. On the other hand, for those who didn’t have good understanding of patients’ healthcare, it could be a burden and a problem for the family to take care the mental disorder patients so that the family decided to do readmission for the mental disorder patients. This study is expected to give an input for the psychiatric hospital to improve the education for the family about the mental disorder patients’ healthcare at home after the patients return from hospital.

Keywords: Readmission, Family support, and family burden.

Introduction

Schizophrenia is one of the most severe mental disorders. According to WHO (2012), there are 24 billion people in the world suffered from schizophrenia between the ages of 15 to 35 years. Schizophrenia cases often occur and the patients also often experience readmission repeatedly with a 30-day return indicator(1).

The prevalence of mental disorders in some countries experiencing readmission after 30 days of returning from hospital occurred in the United States, Japan and Brazil. Most of Americans were diagnosed with mood disorder and schizophrenia as many as 12.6%(1). In Japan, there were 62% patients with schizophrenia diagnose conducting readmission in 2014(2).

Readmission towards the psychiatric patients after 30 days of returning from hospital with the same diagnose is a negative result for psychiatric patients(2). This may be due to many factors, such as illness or relapse, low social support, low family income, increased stigma accompanying schizophrenic patients(3),family inability towards patients’ treatment, non-compliance in taking medicine given by the hospital(4),Moreover, the families feel the burdens in taking care of the family members with mental disorders(5).

Readmission is the main source of costs for the health system, in which the re-enrollment, especially for the hospital as an indicator of hospital performance that may impact on the quality of health services(6).Mental health services community can be a solution for the families by providing information and education through
therapeutic communication, thereby increasing the ability of the families to take care of the family members with mental disorders, and reducing the prevalence of readmission at hospital towards psychiatric patients(7).

**Research Methodology:** This research used descriptive analytic design with cross sectional study approach. The setting of the research was at HB Sa’anin Padang Psychiatric Hospital. The variables were family support, family burden, and readmission. The respondents of this research were the families of the patients with mental disorder who visited HB Sa’anin Padang Psychiatric Hospital. The sampling technique used was purposive sampling technique with the sample as many as 106 families who did readmission towards family members with mental disorder.

The data were collected by using questionnaires given to each family who visited the Psychiatric Hospital and conducted readmission <1 month and ≥ 1 month. The questionnaires about family support were taken from the theory Friedman, 2011 consisted of 24 items of questions about emotional, informational, judgmental and instrumental support. The measurement used median. The family burden theory (CSI) consisted of 13 items of questions which consisted of subjective burden and objective burden.

After that the researcher did analysis data using simpleregresion logistik to know the significant relationship between independent variable and dependent variable if p-value <0,05. The researcher used Logistic Regression analysis to know the dominant variable in relation to the readmission by using Backward LR method to see which variable had the most significant relationship with readmission using SPSS 20 software.

**Findings**

**Univariate Analysis:**

**Table 1: The Family Support and Family Burden towards Readmission on the Patients with Mental Disorder at HB Sa’anin Padang Psychiatric Hospital**

</tbody>
</table>

From Table 5, the results revealed that the variable most closely related to the readmission towards the family members with mental disorder was family burden. Family burden was the most dominant variable in which the value of p-value = 0.035. From the analysis results, it was obtained the value of Odd Ratio (OR) = 6,247 times underwent the readmission within less than 1 month for those with heavy family burden in taking care the family members with mental disorder compared with for those with light family burden in taking care the patients at home.

**Family Support:** It was supported by the result of the questionnaires in which the family gave less judgmental support. 71.7% of the families rarely spent their time to train the patients with routine activities at home. 69.8% of the families rarely helped the patients in taking the medicine and observing whether the patients really took the medicine. In their study, based on the family support surveillance, there are 40% of the family give worst family support to the patients who are not compliant in treatment while there are 49.4% of the family give good family support to the patients and it causes the patients being compliant in treatment. The family support will affect the compliance of the patients in treatment. The better the family support given by the family, the less the relapse happens. It also will reduce the readmission in a short-term or long-term period.

In (9), it is stated that family support towards psychiatric patients is important because with affection, empathy, attention given by the family, the willingness to spend time with the patients will make the patients feel appreciated and loved. This condition enables the patients to take medicine cooperatively and willingly so that it will reduce the readmission towards the psychiatric patients.

The psychiatric patients need family support especially in the treatment process, thus helping the psychiatric patients to go back to the community. The psychiatric patients who do not get enough family support will stigmatize themselves so that it will cause the non-compliance in taking medicine and treatment(10).

According to (16), she states that taking the medicine irregularly and discontinuing the treatment as symptoms subside towards the psychiatric patients will cause relapse and increase the readmission compared with the psychiatric patients who are compliant in taking medicine. Therefore, the families should pay attention to the psychiatric patients’ treatment at home.

The family support consists of informational, judgmental, instrumental and emotional support. It can be done by giving support in treatment, giving compliments, providing information about the patients’ treatment, giving empathy and compassion to the patients so that the patients feel owned and loved. It also raises the patients’ self awareness to recover, makes the patients be compliant in undergoing treatment, and reduces the readmission(10).

**Family Burden:** The burden felt by the family could be caused by several reasons: 45.3% experienced their thoughts often focused on the patients; 42.5% caused by emotional changes in the family; 86.8% felt uncomfortable in taking care of the patients; 85.8% felt lack of sleep; and 78.3% often had financial problems in treating patients at home.

Based on the result of the research conducted on family members in China, it is stated that the burden of family members doing readmission is a strong correlation between the family members and the patients. It can be caused by the fear about the patients did some violence, the disturbance for the family daily activities (8.3%), and the anxiety experienced by the family. The anxiety felt by the families is a psychological response because the families have less understanding about how to take care the patients. The anxiety is also an emotional burden for the family to take care the patients(5).
The family burden is significantly high in family members with mental disorders, where the families feel uncomfortable at home and also suffer from sleep disorders. This also affects the physical health of the family\(^{(12)}\).

Physical health problems are also associated with the burden felt by the families either in the form of subjective burden and objective burden. The families think that having a family member with mental disorder is a disgrace that made the family feel embarrassed and anxious towards the psychiatric patients\(^{(3)}\).

The problem of stigma in the prevention of psychiatric patients is still a significant constraint for patients and families. It can be seen from the characteristics of the community that are not supportive so that the families want to re-enter the family members with psychiatric problems to the psychiatric hospital\(^{(7)}\). The family should be a source of support for the psychiatric patients but for those who are lack of understanding about how to take care the psychiatric patients will think it is as a burden and problem for the family.

The families as the caregivers for the psychiatric patients at home facing various barriers bear the burden in taking care of the psychiatric patients who are not compliant in taking medicine that can lead to the relapse\(^{(9)}\).

The non-compliance in taking medicine remains as one of the greatest challenges on the psychiatric patients. Based on the study, there were 40%-50% patients whom were not compliance in treatment.

**Multivariate**

**Family Burden:** Family burden is an unpleasant level of experience in the family as a result of the condition of the family members. This condition can lead to the increase of emotional and economic stress for the families as well as the family distress level of experience\(^{(12)}\).

The presence of a person with a mental disorder in the family is often associated with some objective and subjective burden on family members, especially those who have care givers in taking care of the mental disorder patients. Based on the research\(^{(13)}\), the families with the mental disorder family members experienced 32.1% heavy burden in taking care of them. The family felt emotional burden facing the change of the patients’ behavior and the financial burden in Nepal.

The burden can be felt by the families when the caregivers do not get the help or other family support they need so that the caregivers will do what they can, physically or financially. Consequently, the caregivers will easily experience fatigue, stress, anxiety, and depression. This study also suggests that the emotional burden will be more severe for the families if the families as the caregivers give less affection as a caregiver\(^{(14)}\).

The families as the caregivers at home face various barriers and bear the burden of taking care of the clients who are not obedient or the family that have much pressure will easily get stress in taking care of the family members with mental disorders. If the families do not face the burden and understand in taking care of the patient, the family will optimally play the role and function in taking care of the patients with mental disorders\(^{(9)}\).

The caregivers are responsible for the care of family members with mental health disorders at home who often undergo changes in their lives that can produce stress and burden. To avoid those things, the family should understand the symptoms of recurrence on the patients\(^{(15)}\).

**Conclusion and Suggestion**

**Conclusion:** Good family support will affect the patients’ healthcare treatment compared to the family who gave less support. The forms of the family supports that can be given by the family are such as instrumental, assessment, emotional, and informational support. The less support given by the family can be caused by several reasons such the burden in taking care of the patient, the pressure experienced by the family, the stress, and also the lack of family understanding related to how to take care of the family members with mental disorders that can cause readmission.

**Ethical Consideration:** The study was conducted after going through the procedure of ethical review pass with the research ethics committee at BLU RSUP Dr. M. Djamil Padang

**Source of Funding:** Self

**Conflict of Interest:** To obtain a master’s degree in nursing

Baby Friendly Hospital Initiative in the Middle East Countries: A Review of the Literature

Fakher Abobaker Ahmed Gli1, Dale Spence2, Finoa Lynn3, Richard Tubman4, Zeyad Mohammed Sadeq5

1College of Nursing-Kirkuk University-Iraq, 2Senior Lecturer-Queen’s University Belfast-UK, Professor Linda Johnston-University of Toronto-Canada, 3Lecturer-Queen’s University Belfast-UK, 4Consultant Neonatologist-Belfast Trust-UK, 5College of Medicine-Kirkuk University-Iraq

Abstract

Background: Successful implementation of the Baby Friendly Hospital Initiative programme with continued prenatal and postnatal support for mothers is of great importance at the local, national and global levels, and effectively contributes to the increased initiation, duration and exclusivity of breastfeeding.

Aim: The aim of this review is to identify any published studies on BFHI related to the promotion, support and protection of breastfeeding in Middle East countries and regions.

Method: Three electronic search databases were used: Cumulative Index of Nursing and Allied Health Literature (CINAHL plus); Medical Literature Analysis and Retrieval System Online (Medline) (1946 to 2018); and Excerpta Medica database (EMBASE). In addition, a hand search of relevant journals was conducted, including the International Breastfeeding Journal and Journal of Human Lactation, and the Iraqi Virtual Science Library and Iraqi Academic Scientific Journals database. The search was limited to studies published in English or Arabic. No limits were placed on the search in relation to publication date.

Results: A total of 1542 records were identified from the database searches, 400 of which were duplicates of the 1142 records screened by title and abstract, 1130 were excluded, as they mostly related to breastfeeding and not the BFHI programme. The full texts of 12 studies were reviewed and inclusion and exclusion criteria were applied, resulting in 5 studies eligible for inclusion in this review.

Conclusion: Two main gaps have been identified through the literature review. First, there is a dearth of studies which apply Organisation Readiness for Change (ORC) theory to assess clinical and non-clinical staffing levels required to deliver the BFHI programme. Second, few researchers have sought to understand how the organisational cultures of individual hospitals influence compliance with the Ten Steps to Successful Breastfeeding and the Code.

Keywords: Baby Friendly Hospital Initiative (BFHI), the Ten Steps to Successful Breastfeeding, International Code of Marketing Breastmilk Substitutes (the Code), Organisational Readiness for Change (ORC), barriers and facilitators to BFHI.

Introduction

Studies have shown that successful implementation of the BFHI programme with continued prenatal and postnatal support for mothers is of great importance at the local, national and global levels, and effectively contributes to the increased initiation, duration and exclusivity of breastfeeding.1

The rationale for this literature review is to explore the barriers and facilitators to implementing and sustaining the BFHI programme in the Middle East. Specifically, this literature review poses two questions:
1. What are the barriers and/or facilitators to implementation and sustained compliance with the BFHI program?

2. What are the levels of knowledge, attitudes and practices of staff working within accredited Baby Friendly hospitals or those working towards accreditation?

The aim of this review is to identify any published studies on BFHI related to the promotion, support and protection of breastfeeding in Middle East countries and regions. The review will also help to gain an understanding of the Method previously used in Middle Eastern studies to evaluate the BFHI programme, and identify any gaps in the literature, helping to inform the current study by leading to a clear conceptualisation of the problem under examination.

Method

Search strategy: In order to identify relevant published literature related to the review questions above, a systematic search strategy was developed. The search acronym of Population, Exposure, Outcomes, and Study setting (PEOS), which is commonly used in search strategies to identify qualitative and observational research, was used to develop a list of search terms comprising Medical Subject Headings (MeSH terms) and keywords.

The terms were identified and classified into five categories: i. Population (nurses, midwives, physician, or administrators), ii. Exposure 1 (Breastfeeding, Baby Friendly, BFHI or BFI), iii. Exposure 2 (organisational theory, organisational culture or change management), iv. Outcomes (knowledge, attitudes, practices, barriers or facilitators), and v. Study setting (Middle East). Three electronic search databases were used: Cumulative Index of Nursing and Allied Health Literature (CINAHL plus); Medical Literature Analysis and Retrieval System Online (Medline) (1946 to present); and Excerpta Medica database (EMBASE).

In addition, a hand search of relevant journals was conducted, including the International Breastfeeding Journal and Journal of Human Lactation, and the Iraqi Virtual Science Library and Iraqi Academic Scientific Journals database. The search was limited to studies published in English or Arabic. No limits were placed on the search in relation to publication date.

Selection process: Following the identification of records from the electronic search and hand search of journals, duplicate records were removed. Inclusion and exclusion criteria were then introduced to screen the title and abstract of each record of the remaining records, the full text was obtained to assess each study’s eligibility for inclusion in this review. Inclusion and exclusion criteria were applied.

Data extraction and synthesis: Studies eligible for inclusion were analysed to extract data on the study setting, year of publication, objectives, sample, Method used to conduct the study, the main findings and those presented in tabular form. A narrative synthesis of the studies enabled each of the review questions to be addressed and conclusions to be drawn.

Critical appraisal tools for quality assessment of included studies: A critical appraisal of the included studies was conducted. This quality assessment was carried out using the relevant Critical Appraisal Skills Programme (CASP) tool. Critical Appraisal Skills Programme (CASP) tool for qualitative research studies and cohort studies consists of 10 questions. All of the key elements in the research were evaluated to determine quality and credibility in order to provide evidence for the subsequent focus of the research and justification for the study design.

Results

Systematic search process: Initial searches in electronic search databases were conducted in May 2014 and were updated in August 2017 using the systematic search strategy. Figure 1 presents the Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) flow diagram which reports each stage of this process. A total of 1542 records were identified from the database searches, 400 of which were duplicates of the 1142 records screened by title and abstract, 1130 were excluded, as they mostly related to breastfeeding and not the BFHI programme. The full texts of 12 studies were reviewed and inclusion and exclusion criteria were applied, resulting in 5 studies eligible for inclusion in this review.
Evidence of barriers and/or facilitators to the implementation and sustainability of the BFHI in the Middle East

The first review question involves reporting the findings on barriers and/or facilitators to implementation and sustained compliance with the BFHI programme. Studies included in this review provide evidence for this review questions in their research objectives. The first study by Gokcay1 aimed to document practices in the context of the Ten Steps, in order to identify factors which affect the implementation of BFHI programme and make recommendations for improving practice. Several barriers to the implementation of BFHI were identified by this study, specifically related to each of the Ten Steps. They included the absence of a specialised hospital team on lactation management; low number of healthcare staff trained in breastfeeding; inappropriate hospital setting, environment and overcrowding; patient preferences; absence of breastfeeding policy; high turnover of administrative staff; no BFHI courses; lack of staff numbers; no antenatal education about breastfeeding; disagreement among some of physicians about early initiation of breastfeeding; lack of knowledge in nurses about how to maintain breastfeeding; and no breastfeeding support groups.

The second study, by Edward2, described the unique challenges faced by two BFHI hospitals during the accreditation process. It used a problem-solving approach through conducting steering groups, and pre- and post-knowledge tests about breastfeeding and the Ten Steps to Successful Breastfeeding were also applied. The study revealed many of the challenges faced in the implementation of BFHI programme at the study site. They included insufficient breastfeeding policies in written form; different opinions on breastfeeding among staff; and breastfeeding was not seen as a high priority issue among delivery room staff. Formula feeding was normal in the postnatal wards; there was poor coordination between hospital facilities; women attend the hospitals with little or no antenatal education and rely on their families for breastfeeding education more than clinical staff; mixed feeding was a normal practice among mothers; and there was delayed initiation of breastfeeding.

The third study, conducted by Al Ghazal3, was a campaign developed to encourage breastfeeding culture by providing professional support and facilitation during the BFHI accreditation process. This included the development of breastfeeding education resources, professional support, and organising seminars in healthcare facilities and community settings. In addition, the campaign aimed to create community awareness through social media. The study resulted in the accreditation of 11 healthcare facilities.

Evidence on the knowledge, attitudes and practice of staff working with the BFHI in the Middle East: The second review question seeks to report any findings related to the levels of knowledge, attitudes and practices of staff working within accredited Baby Friendly hospitals or those working towards accreditation. Studies included in this review provide evidence which relates to this question. The first study, by Sallam4, evaluated the knowledge, attitudes and practices of healthcare staff and women regarding the initiation of breastfeeding within first hour of life in one hospital. The study revealed that there was a significant statistical difference between the total score of nurses’ practices in the paediatric department, as they were higher than their counterparts in the gynaecology and obstetrics departments. Also, the study showed that the most frequent factors associated with delayed initiation of breastfeeding were caesarean section, maternal anaemia, maternal illness during pregnancy and delivery and premature birth. The recommendation made by this study was to reactivate the BFHI programme at the study site, which indicates that this hospital had lost the BFHI certification due to non-compliance with BFHI standards.

The second study is prospective cohort study survey by Mosher5, designed to study staff opinions in
the context of the BFHI programme in two hospitals (BFH and non-BFH). The results indicated that the staff in the accredited BFH were more familiar with BFHI components. Also, weaknesses which affect exclusive breastfeeding and compliance with BFHI were identified, including a high rate of formula and mixed feeding among the samples (mothers) upon discharge from the non-BFHI hospital, and a high rate of mixed feeding among the samples (mothers) upon discharge from the BFHI hospital.

**Quality assessment of the included studies:** The methodological design of the study by Gokcay\(^3\) was largely based on the WHO/UNICEF reassessment process of the BFHI (1992). This approach is considered a rigorous research mechanism to study the BFHI, as multiple means were used to access the required data, and the tools were derived mainly from standardised tools (WHO/UNICEF, 1992) to reassess the BFHI programme. In terms of sample selection, the numbers are based on the instructions of WHO and UNICEF, and those selected were the most appropriate to provide access to this type of data. This is due to the fact they worked in the clinical departments covered by the BFHI, or were non-clinical staff who held responsibility for the administration of BFHI.

The study by Edward\(^4\) has been described as action research, and used a five stage cycle approach by convening a steering group to study the Ten Steps to Successful Breastfeeding. This problem solving approach is considered a novel approach, as it has not previously been used to study the BFHI programme. The selection method of participants for this study is clear, and they are the most appropriate to provide access to this type of knowledge. The methodology of data collection does not justify why the steering group was chosen and how it was conducted in terms of language, duration, number of participants per group, method of documentation; all of which were not mentioned.

The study by Sallam\(^5\) evaluated knowledge, attitudes and practices regarding the initiation of breastfeeding within the first hour of life. It was conducted through surveys via questionnaire. Systematic random sampling was used, the selection of samples in this study is satisfactory and most appropriate to provide access to this type of knowledge, but is not based on a specific BFHI document. Therefore, we can say that the selection of samples involves unjustified mixing of different groups (i.e. physician and mothers). This is reinforced by the fact that the status of the questionnaire used is unknown, i.e. whether it is a standardised, reliable and valid tool, which may compromise the reliability and validity of the data obtained. The study did not mention any changes to its design or whether they occurred or not.

The study by Al Ghazal\(^6\) was a campaign developed to examine developing breastfeeding culture in 11 healthcare facilities, with a focus on BFHI programme by providing professional support and facilitation for the BFHI accreditation process. It was conducted through multisectorial and multidirectional campaigning, using an educational program. The campaign focused on breastfeeding education through capacity building in both healthcare workers and professional support to facilitate BFHI accreditation. It included the development of educational content and resources; organising and conducting seminars in healthcare facilities and community settings; and increasing community awareness through social media.

The study by Mosher\(^7\) examined staff opinions in the context of the BFHI programme. A prospective cohort study survey method was utilised, conducted between December 2013 and September 2015. The sample was drawn from two healthcare facilities (BFH and non-BFH), 9 hospital staff from the accredited BFH including administrative and maternity staff, and an unknown number from non-BFH. Also, 277 women who attended the study site were also recruited. This was the first study about the BFHI programme in the researchers’ country. The study recruited hospital staff from different levels (clinical and non-clinical). This has potential to provide comprehensive views from all those involved in the implementation of the BFHI programme. The participants were followed up on for six months by trained researchers.

**Discussion**

When a BFHI hospital is evaluated, it is important to obtain a review of relevant data according to WHO/UNICEF. This includes breastfeeding rates for the hospital and/or city; hospital breastfeeding policy; training records; training curriculum followed; BFHI implementation documents; annual hospital birth rates; and numbers of hospital beds. Whether required within the research objectives or obtained through achieving another objective, this may be useful for other facilities seeking to implement the initiative, and to improve the expected outcomes of its implementation. The studies

\(^1\)Indian Journal of Public Health Research & Development, October 2019, Vol. 10, No. 10

\(^2\)September 2019, Vol. 10, No. 10

\(^3\)Gokcay, 1992

\(^4\)Edward, 1992

\(^5\)Sallam, 1992

\(^6\)Al Ghazal, 1992

\(^7\)Mosher, 1992
from Middle Eastern countries included in this review did not consider this advice as relevant to the BFHI.

The lack of theoretical underpinning to support research development and progress is evident in the studies included in this review. Also, there is a lack of adherence with BFHI standards. Additionally, staff knowledge, attitudes and practices regarding the BFHI programmewere available, and affected by organisational factors. A new approach in the research field indicates that the best method to evaluate any programme is the mixed method as it measures rates and perceptions.  

**Concluding Remarks**

Two main gaps have been identified through the literature review. First, there is a dearth of studies which apply Organisation Readiness for Change (ORC) theory to assess clinical and non-clinical staffing levels required to deliver the BFHI programme. Second, few researchers have sought to understand how the organisational cultures of individual hospitals influence compliance with the Ten Steps to Successful Breastfeeding and the Code.

**Conflict of Interest: Nil**

**Source of Funding:** This study was funded by the official representative of the Iraqi Ministry of Higher Education and Scientific Research (MOHESR) in the UK and Ireland.

**Ethical Clearance:** Ethical approval and permission to access participants was obtained from the School of Nursing and Midwifery Research Ethics Committee, Queen’s University Belfast and the Ministry of Health in Iraq.

Antenatal Care Quality Analysis Using the European Foundation Quality for Management Method in the Hospitals in Surabaya

Muhammad Ardian C. L.1, Farouk Ilmid Davik2

1Department/SMF Obstetry Ginekology, Medical Faculty, Airlangga University, Dr.Soetomo Hospital, Surabaya, East Java, 2Department of Health Administration and Policy, Faculty of Public Health, Airlangga University, Surabaya, East Java

Abstract

The Maternal Mortality Rate (MMR) in East Java is among 10 regions with the highest rates in Indonesia. Some medical factors constituting the determinant proxies which contribute to the maternal death include pre-eclampsia and eclampsia (36.07%) and bleeding (21.81%), heart disease (12.93%), infection (6.07%) and other causes (22.90%). The purpose of this research is to analyse the quality of antenatal care by using the European Foundation Quality for Management (EFQM) at Hospitals in Surabaya.

This research is an observational descriptive research with a cross-sectional study design. The population on this research comprises of 60 hospital staff who provide antenatal care service, including medical staff and administrative staff, who are chosen through a purposive sampling. The research is conducted between September 2017 and February 2018 at the obstetrics and gynaecology polyclinic at Airlangga University Hospital, Jemursari Islamic Hospital and Haji General Hospital.

The research result shows that the antenatal care service provided at Airlangga University Hospital is categorized as pretty good with a score of 58%, comprised within the phase of development III which covers an orientation to the system with service development innovation for patient. The antenatal care service provided at Jemursari Islamic Hospital is categorized as good, comprised within the phase of development IV with a score of 61%, focusing on the chain of internal and external organization (customers) which become the main highlight in the service development. Meanwhile, the antenatal care service provided by Haji General Hospital falls into the phase of development II which focus on the process of service provided with a score of 39%, thus categorized as poor.

As a conclusion, the analysis result on the quality of antenatal care using the approach of EFQM method at the hospitals in Surabaya is included in the category of pretty good, where the EFQM score of Airlangga University Hospital is considered as pretty good with the score of 580, the antenatal care at Jemursari Islamic Hospital is considered as good with the score of 616 and the antenatal care at Haji General Hospital is considered as poor with the score of 392. The quality of antenatal care in private hospitals is superior than the antenatal care in public hospitals.

Keywords: MMR, European Foundation Quality for Management, Antenatal Care.

Introduction

Maternal Mortality Rate (MMR) is a growing problem and consists of an important issue in the medical world. The MDGs target for MMR in 2015, which is 102 per 100,000 live births, was not accomplished so that its continuation is necessary in the Sustainable Development Goals (SDGs). Maternal and child health is still a priority program and an achievement target for the Sustainable Development Goals (1).
The depiction of maternal and child health in Indonesia is not satisfying yet. East Java is one of the provinces included in the 10 regions with the highest maternal and infant mortality rate in Indonesia. Despite the fact that the MMR in East Java tends to decrease from a general perspective, but the MMR is still considered as high in absolute terms. In 2014, the MMR in East Java has attained 93.52 per 100,000 live births. This number has reached the MDGs’ target of < 102 per 100,000 live births. However, in terms of the national target, that number is still problematic because it is still far from the target determined by the National Strategic Plan which is 80 per 100,000 live births. The high prevalence of MMR is caused by several factors which can be clustered as proxy determinant, intermediate and contextual (2). The medical factors that belong to the proxy determinant and that contribute to the maternal mortality are pre-eclampsia and eclampsia (36.07%) and bleeding (21.81%), heart disease (12.93%), infection (6.07%) and other factors (22.90%) (3).

The low number of the utilization of maternal health service during the pregnancy also contributes to the maternal morbidity and mortality. Yet, there is an increase in the coverage of access for pregnant mothers who receive antenatal care (ANC) from the health workers. In 2014, the prevalence of ANC has attained 81.6% during the first trimester or K1 whilst the frequency of ANC with the 1-1-2 pattern or K4 has attained 70.4 or 70.4%. One of the Method to reduce the MMR and to improve the maternal care is by increasing the quality of ANC service, especially at the hospitals (4).

ANC service in the hospitals should be improved in a comprehensive, integrated and qualified manner so that every problem which may occur during pregnancy and which potentially trigger a complication leading to the maternal death can be detected and prevented. Thus, one of the causative factors of maternal death may be handled because of a quality ANC service in the hospitals. The European Foundation for Quality Management (EFQM) is a tool to assess the service performance of an organization. The EFQM Model in the health service may be used as a self-assessment instrument at all level of health care, including the antenatal care service in the Type B Hospitals as an advanced referral health facility (5). The general purpose of this study is to determine the quality of ANC provided in the Type B Hospitals in Surabaya by using the European Foundation Quality for Management (EFQM) Model.

Method

The approach used in this study is the observational descriptive approach with a cross-sectional design. The locations in this study are Airlangga University Hospital, Haji General Hospital and Jemursari Islamic Hospital. The study period is 6 months, starting from the creation of research proposal in September 2017 up until February 2018. The unit analysis in this study is the hospital, and the populations consist of the staff in 3 (three) Type B hospital in Surabaya which are Airlangga University Hospital, Haji General Hospital and Jemursari Islamic Hospital. The populations include either the medical staff or the non-medical staff related to the ANC service in the Obstetrics and Gynaecology Polyclinic. The total of population in this study is 60 people. This study chooses the hospital staff as the research object because they are directly involved in the provision of ANC service for patient. The Obstetrics and Gynaecology Polyclinic is also one of the polyclinics who engage in the implementation of the individual ANC service. A purposive sampling is used as a sampling technique in this study.

Result

Based on the calculation result of each sub process of the service, it can be continued by calculating the process as indicated in the Table 1. This calculation is performed based on the quality management theory of the European Foundation Quality for Management (EFQM). The total process calculation of ANC in Airlangga University Hospital, Jemursari Islamic Hospitals and Haji General Hospital is shown in the Table 1 below.

Table 1. Calculation Result of the Service Process in Airlangga University Hospital

| Process Score | 2,90 |
| % Process Achievement | 58,00 |
| Process Criteria | 580,00 |
It can be concluded that the majority of ANC process management in the hospital in Surabaya is in the phase III or level III based on the EFQM criteria, which means that there is an orientation to the system with the process achievement percentage of 58% or ranged between > 40% - 60%. Thus, the general ANC service at the hospital as well as its supporting functions are already managed in accordance with the existing system. So, the highlight in its management still focuses in the external customers. The sub process assessment result indicates a high score for 1b and 1d, which means that the service process has been done appropriately by using a continuous innovation to fulfil the needs of patients and stakeholders. The radar diagram of ANC in Airlangga University Hospital is as follows:

![Figure 1. Airlangga University Hospital ANC Radar](image)

Based on the Figure 1, it is shown that the antenatal care radar of the Airlangga University Hospital focuses on the process management 1b and 1d where the service process is carried out appropriately by using a continuous innovation to fulfil the needs of patients and stakeholders. The ANC in Airlangga University Hospital is considered as pretty good with EFQM score of 580.

Table 2. Calculation Result of the Service Process in Jemursari Islamic Hospital

<td>Process Criteria</td>
<td>616,00</td>
</tr>
</tbody>
</table>

Based on the Table 2 above, it can be concluded that the majority of ANC process management in the hospital in Surabaya is in the phase IV or level IV based on the EFQM criteria, which means that there is an orientation to the chain with the process achievement percentage of 61.60% or ranged between > 60% - 80%. Thus, the general ANC service in Jemursari Islamic Hospital focuses on the ANC process management and the patient assessment. This orientation considers that the internal factor of an organization is something which should be pointed out. The orientation to the chain has already positioned the stakeholders as the strategy partner of an organization to fulfil the ever-changing needs of the customer.

![Figure 2. Jemursari Islamic Hospital ANC Radar](image)

Based on the Figure 2, it is shown that the ANC radar of Jemursari Islamic Hospital focuses on the process management 1b and 1d where the service process is carried out appropriately by using a continuous innovation to fulfil the needs of patients and stakeholders.

</tr>
<tr>
<td></td>
<td>% Process Achievement</td>
<td>39,20</td>
</tr>
<tr>
<td></td>
<td>Process Criteria</td>
<td>392,00</td>
</tr>
</tbody>
</table>
Based on the Table 3 above, it can be concluded that the majority of ANC process management in the hospital in Surabaya is in the phase II or level II based on the EFQM criteria, which means that there is an orientation to the chain with the process achievement percentage of 39.20% or ranged between > 20% - 40%. Thus, the general ANC service in Haji General Hospital focuses on the process of providing health care to the patient as well as its improvement.

Findings

Antenatal Care Process is Planned and Developed Based on the Patient’s Needs and Expectation: The purpose of patient’s needs and expectation assessment is to observe the gap wideness between them. The inexistence of gap between the needs and the expectation results in an optimal satisfaction of patient. Each hospital is required to always maintain the trust from all patients by improving the service in order to increase the patient satisfaction. Thus, the hospital needs to be scrupulous in determining the patient’s needs as a way to fulfil their expectation and increase the satisfaction on the service that has been given. The reason for this is because in principle patient satisfaction is a long-term strategy which requires a commitment for the sustainability of a hospital in carrying out its duties \(^6\).

The research result shows that the calculation of service which is designed and developed based on the needs and expectation of patient has achieved the number of 51% (Airlangga University Hospital), 58% (Jemursari Islamic Hospital) and 47% (Haji General Hospital). This indicates that in the implementation of sub process of ANC Airlangga University Hospital, Jemursari Islamic Hospital and Haji General Hospital are all in the phase of development III which is system-oriented. The tendency to this orientation is located in the external customers where they play a role of a main point of the hospital service process control. It is based on the perception that people’s satisfaction and option is a priority for hospital\(^7\).

Relation Improvement and Management with Antenatal Care Patient in the Hospital in Surabaya: The hospital is not only required to be as a systematic and complex medical health care provider but also as a health care provider which maintains a good relationship with the patient and the community. Based on the study result on the ANC patient relationship sub process, the achievement point for Airlangga University Hospital is 66%, 61% for Jemursari Islamic Hospital and 39% for Haji General Hospital. This result indicates that the patient relationship sub process in Airlangga University Hospital and Jemursari Islamic Hospital is included in the chain-oriented phase of development IV. Meanwhile, Haji General Hospital is process-oriented. In each hospital, the relation between health workers and patients should be built to maintain a communication related to the medical service. This may influence the ANC service quality process provided by the health workers in Type B hospitals in Surabaya either mentally or socially.

European Foundation Quality for Management Score for Antenatal Care in the Hospital in Surabaya: Based on the study result, the service process calculation shows that the ANC process in Airlangga University Hospital is oriented to the system with a total score of 58% and categorized as quite good according to TQM. The ANC provided in Jemursari Islamic Hospital gains an EFQM score of 61.60% (phase IV) and is categorized as good quality. Meanwhile, the EFQM score of Haji General Hospital is 39.20%, categorized under the process-oriented group and still considered as poor quality. This is supported by the achievement of score majority from the service process to the service sub process according to the total quality management which is comprised within the phase of development IV and is chain-oriented.

Based on the illustration of the position of management in each sub criteria shown in the radar chart,
it can be observed that the total quality management score of Airlangga University Hospital and Jemursari Islamic Hospital in the service suitability in using the innovation to fulfil the needs of patients and stakeholders almost reaches the target, whilst Haji General Hospital mainly focuses on the service produced and provided for patients. It is different from the planned and developed service based on the patient’s need and expectation which attains the lowest position in terms of the total quality management target.

**Conclusion**

The result of antenatal care assessment with EFQM method in the hospitals in Surabaya indicates that the overall antenatal care quality in Airlangga University Hospital is considered as quite good with a score of 580, the ANC in Jemursari Islamic Hospital is considered as good with a score of 616 and ANC in Haji General Hospital is considered as poor with a score of 392. This means that the antenatal care quality in the private hospitals are superior than the antenatal care quality in the public hospitals. It is important for the hospitals to improve the antenatal care quality to be total quality management oriented by performing a periodic service result evaluation weekly at the Obstetrics and Gynaecology Polyclinic and a periodic training and test about ANC service for all staff. The purpose of this training is to upgrade the staff’s knowledge regarding the service in accordance with the current development so that it can be applied when they provide the related service. The test can be carried out as an indicator of achievement from the training.

Antibacterial Activity of Zinc Oxide Nanoparticles Against Acinetobacter baumannii

Firas Nabih Jaafar1, Mustafa Shakir Hashim2, Huda Zuheir Majeed1, Laith Baseim Ali3, Reem Saadi Khaleel2, Nadia Kamil Bashar1, Anaam Hameed Batah1

Abstract

Thirty Acinetobacter baumannii were isolated and identified from different sources. The antibiotic sensitivity test for these bacteria was done against ten antibiotics, showing different high levels of resistance. ZnO particles with the sizes (20 to 520) nm were prepared chemically and used as antibacterial for the most resistible bacterial isolates against ten antibiotics. It was found that the most effective size was 20 nm with the highest inhibition zones.

Keywords: A. baumannii, nano Zinc Oxide and Antibacterial activity.

Introduction

Acinetobacter baumannii (A. baumannii) is anaerobic, immotile, gram negative bacillus and pleomorphic. It has been isolated from skin, respiratory system and its secretions of infected patients [1,2].

It was found that this bacteria had the ability to change its genetic structure from avirulent to virulent by gaining genes encoded of virulence from Pseudomonas, Salmonella and Escherichia, especially in environments filled of patients treated with board spectrum antibiotics such as intensive care units of hospitals[3]. As bacterial isolate, A. baumannii is considered as the most causing problems to health care workers due multiple antibiotic resistance.

Spread of multiple antibiotic resistant bacteria is due to random use of antibiotics besides acquiring resistance genes from habitat [4]. This problem was overcome by the using of nanoparticles which showed high antimicrobial activity against resistant bacteria with less toxicity.

Nano technology is playing a great role in the field of antibacterial materials. In this important field, Zinc oxide nanoparticles (ZnO NP) are considered to be one of the most active nanoparticles. It was synthesized simply, eco-friendly and had good antimicrobial activity [5].

This study aimed to identify the most resistible A. baumannii isolates against ten antibiotics, then using ZnO NPs as antibacterial against these isolates.

Materials and Method

Samples preparation: 30 isolates of A.baumannii were isolated from different sources (e.g. wound, burn, urine, blood and sputum), bacterial isolates were isolated and identified according to[6], then by VITEK 2 System (Version 5.01 BioMerieux).

Suspension of each of the 30 A.baumannii was isolated (0.5 concentration of McFarland Standard). It was prepared by inoculating culture of the stock to separate tubes containing 3 ml of Mueller Hinton Broth (Difco, USA), then incubated at 37°C/24 h.

Antibiotic sensitivity test: The sensitivity of isolates to antibiotics was done by Kirby-Bauer disc diffusion method using the following antibiotic discs: Tobramycin, Gentamicin, Ciprofloxacin, Chloramphenicol, Cephalazidine, Cloxacillin, Piperacillin, Amoxicillin, Amikacin and Imipenem. Isolates were recorded either as sensitive (S) or resistant (R) depending on [7].

Synthesis of ZnO NPs: ZnO NPs were prepared by adding different weights of Zinc acetate dehydrate

Zn(CH3COO)2.H2O to isopropanol alcohol(100 ml). Then few drops of mono ethanol amine (MEA) was added to get a clear and homogenous solution
The solution was agitated for one day \[8\]. Six solutions were prepared and coded as it was listed in Table (1). ZnO NPs size was measured by using “Brookhaven instrument” and 90Plus particle sizing software Ver. 5.34.

To test the structure of the prepared ZnO, it was deposited on glass substrate by spin coating machine. Agitated solution (100μl) was added on the surface of substrate when it was rotating with 2000 rpm speed. After coating, the sample was annealed at 400 °C for 1 hour. Orientations of ZnO were measured by Shimadzu X-ray diffractometer.

**Antimicrobial Activity:** The bacterial suspension (24 h age) for each isolates of *A. baumannii* was prepared formally. Then 100μl of each bacterial suspension was put on Mueller-Hinton agar plates then spread by swabs and were left to dry. Wells were made in agar by cork. 50 μl of each (1 to 6) of ZnO NPs were put in each well. Then the plates were incubated at (37°C/24 h). Inhibition zones diameters were recorded.

**Statistical Analysis:** The Statistical Analysis System- SAS program 20 was used to evaluate the differences in the parameters of this study.\[9\]. Chi-square test was used to significance comparison between percentage and LSD. Least significant difference test was calculated to find significance between Means in the study.

**Results**

The evaluation of bacterial resistance against ten antibiotics: Identification of bacterial isolates were done by the colony morphology and stained smear was examined microscopically to check shape, structure, arrangement and gram stain reaction of bacterial isolates. Biochemical tests were done and confirmation was done by using VITEK 2 System.

The bacterial isolates showed different levels of resistance against the used antibiotics as shown in Table (2).

From statistical view, there were significant differences between the used antibiotics in this study at level (P<0.05). So some of these antibiotics were effective for therapy but others like Chloramphenicol and Cloxacillin (there resistance percentages were so high about 93.33 and 100% respectively). This means that those antibiotics were not good enough to treat these bacterial infections.

Cephatazidime was the most effective antibiotic because its resistance percentage was 46.66%, while it was 53.33% for both Ciprofloxacin and Tobramycin and it was 56.66% for Gentamycin.

These antibiotic resistance variations were a result for random use of antibiotics for long period without use of traditional ways such as culture and antibiotic sensitivity test.\[11\].

Maraki et al. reported that the resistance to Imipenem and Amikacin were 82.67% and 83.67% respectively.\[12\]. This result was so close to our results. Boroumand et al. showed that Tobramycin resistance was 55.2%, this is in agreement with current results.\[13\]. Another scientific group informed that for Cephatazidime, the resistance was 44.5%\[14\], which is so closely to our results.

* = Significant at (P<0.05), NS= Non-Significant.
In addition to its natural resistance, *A. baumannii* is developing resistance under antibiotic pressure. They had gene over express of different efflux pumps, Beta-Lactamase 210 different types, many Oxacillinase enzymes (e.g. OXA-21like, OXA-23like and OXA-51like), and lower permeability of outer membrane[15].

**The estimation of ZnO characterization:** Fig.1. shows the indexed XRD pattern of ZnO film. This pattern refers to polycrystalline of the film. Diffraction peaks were connected to the ZnO wurtzite structure (JCPDS Card, No. 36-1451).

![Figure 1](image1.png)

**Figure (1) XRD of Zn oxide film on glass substrate**

Fig.2. shows that the solution1 and 6 contain ZnO NPs with different diameters, most of particles inside solution 6 had diameter equal to 20 nm. On the other hand, most particles in solution 1 had diameter 520 nm.

* : significant at (P<0.05), NS: Non-Significant.

**Discussion**

By reading the data in table 3 it is clear that there were high toxicity of ZnO NPs against *A. baumannii*. A maximum inhibition zone (3.3 mm) was recorded for isolate No. 6 (solution code 4). There were significant difference at level (P<0.05) for all isolates except four isolates (15,16,21 and 27).

The activity of ZnO can be explained by the disruption effects of ZnO NPs on the microbial cells[16]. Li et al. confirmed that the bactericidal activity differs according their size, stability and concentration in culture [17].

ZnO NPs is mentioned as “generally recognized as safe” (GRAS) by the U.S. Food and Drug Administration. More smaller size of ZnO NPs had more anti bacterial activity due to high ratio of surface to volume, So it can be used as bacteriocidal and bacterio-inhibitor especially for nosocomial infections[18].

The ZnO NPs were toxic for both gram-negative and Gram-positive bacteria (e.g. *Escherichia coli* and *Staphylococcus aureus*, etc.) and its therapeutic characters are depending on its size. Also, mixed bacterial combinations could be killed by these nanoparticles. Bacteriocidal effects of ZnO NPs was attributed to their nano-sizes and large surfacetovolume ratio. This makes interaction with cell membranes of microbes directly, in addition to metal ions exit from cell in solution [19].

**Findings**

ZnO NP represent an effective therapy for this bacteria especially for multiple resistant isolates and their effectiveness is size-dependent.

**Conclusions**

Current used antibiotics have different effects on *A. baumannii* and ZnO NP are good choice for killing this bacteria.

Effect of Selected Breathing Retraining Exercises on Symptoms and Quality of Life among Asthmatic Children

Gehan M. Amin¹, Gehan A. El-Samman², Azza A. Attia²

¹Assistant Lecturer, ²Professor, Pediatric Nursing, Faculty of Nursing-Cairo-University

Abstract

Diaphragmatic and pursed lip breathing are nonpharmacological approaches that designed to improve ventilatory efficiency, respiratory muscle function, and exercise tolerance, in turn improve asthma symptoms and quality of life among children. The aim of the current study was to evaluate the effect of selected breathing retraining exercises on asthma symptoms control and quality of life among children. Time series quasi-experimental research design was utilized. A convenient sample of 30 children with bronchial asthma was recruited. The study findings revealed that the highest total mean score of asthma control were detected before breathing retraining exercise which decreased significantly in immediate after the intervention and it began to rise slightly again one month after. There were a highly statistically significant improvement in the total mean score of pediatric asthma quality of life across immediate and one month after. The study concluded that selected breathing retraining exercises improving an asthma symptom control and quality of life among children. It is recommended that breathing retraining exercise can be used and integrated with the routine care for children with asthma with emphasize to be performed at home.

Keywords: Breathing retraining exercise, asthma symptoms control, quality of Life, children with asthma.

Introduction

Breathing retraining exercises is an essential component in physical therapy programs designed for patients with asthma to correct their symptoms and improve their QoL. Diaphragmatic breathing (DB) is a technique in which the diaphragm is used to expand the lungs that result in decrease the respiratory rate, decrease oxygen demand, and use less effort and energy to breathe¹. Pursed lip breathing (PLB) is the breathing technique that consists of exhaling through tightly pressed lips and inhaling through nose with mouth closed. It decreases air trapping in the lungs, decreases the work of breathing, improves breathing patterns, and keeps the airways open longer².

Controlling of asthma symptoms considered the main stone in management of asthma in children. The most common asthma symptoms are coughing, particularly at night, in the early morning and with exercise, breathlessness, chest tightness and wheezing. When asthma symptoms get worse, it is known as an asthma attack³.

Recurrent asthma symptoms will affect children quality of life as they develop sleeplessness, daytime fatigue, reduced activity levels and school absenteeism that result in reduced activity levels and restrictions in participation in peers activities. Also the disease management and routines often requiring compliance with health regimes and placing extensive behavior demands on children, which could potentially impact on QOL⁴.

The new millennium has shown that asthma is still among the most frequent inflammatory chronic diseases in childhood that causes greatest disability and frequent hospitalization among children. Repeated, unpredictable episodes of breathlessness and distressing chest symptoms are a fact of life for children with asthma. Unfortunately, children continue to die or experience life-threatening attacks⁵.

Hypotheses:
1. Children with bronchial asthma who will receive selected breathing retraining exercises, their symptoms will differ after practicing exercise than before.
2. Children with bronchial asthma who will receive selected breathing retraining exercises their quality of life will differ after practicing exercise.

Material and Method

Participants: A convenient sample of 30 school age children with bronchial asthma.

Setting: The study conducted in chest outpatient clinic at Cairo-University Specialized Pediatric Hospital, Cairo, Egypt.

Data Collection Tools:

1. A structured interview sheet: It included child and parents’ personal data as child age, gender, rank, parents’ age, level of education, occupation and child disease history, family history of asthma, fathers’ smoking and the main asthma trigger affecting the child.

2. Observational checklists: It is adapted from steps of breathing retraining exercise and included two checklists as the following:
   I. Checklist of diaphragmatic breathing: includes six steps, done step scored one and not done scored 0 and the total score was six
   II. Checklist of PLB: involved five steps, done step scored one and not done scored 0 and the total score was five

3. Asthma Control Questionnaire (ACQ): This scale was developed by and consisted of 23 items that measure three domains of pediatric asthma quality of life including: emotional function (8 items), activity limitation (5 items) and symptom quality of life (10 items). Responses were scored on a 7 point likert scale from 1 (all the time) to 7 (none of the time). Overall QoL score is calculated from the mean score of all the items. Summation of 1 in each item = 23 and indicate maximum impairment, and $7 \times 23 = 161$ that indicate better QoL.

4. Pediatric Asthma Quality of Life Questionnaire (PAQLQ): it was developed by and consisted of 23 items that measure three domains of pediatric asthma quality of life including: emotional function (8 items), activity limitation (5 items) and symptom quality of life (10 items). Responses were scored on a 7 point likert scale from 1 (all the time) to 7 (none of the time). Overall QoL score is calculated from the mean score of all the items. Summation of 1 in each item = 23 and indicate maximum impairment, and $7 \times 23 = 161$ that indicate better QoL.

Tool Validity and Reliability: The study tools (Observational checklists, ACQ and PAQLQ) were submitted to 3 experts in pediatric nursing and pediatrician to ensure the content validity. Coefficients’ alpha between questions was 0.7 for observational checklists and 0.9 for ACQ and PAQLQ.

Procedure: Written consent was obtained from caregivers and oral acceptance from the children after description of the aim and nature of the study. The researcher attended to outpatient chest clinic 2 days/week from 9 am to 12 pm. Through an individual interview with each child and caregiver, the researcher provided complete information about prevention of asthma triggers correct use of inhaler. The 4 study tools were administered by the researcher before intervention as the first assessment and one month after that. The second time assessment was administered using 3 tools (checklists, ACQ and PAQLQ). In the first session of intervention; the researcher started immediately to discuss and demonstrate of breathing retraining exercises for each child individually and guided the child to perform the exercise for the first 15-20 minutes, and the researcher start to correct the wrong steps and guide the child to repeat the exercise for other 15 minutes in a session by performing the exercise 5 times and take a period of rest for few minutes and so on until the end of 15 minutes. Also the caregivers were asked to encourage the child to apply DB and PLB for at least two times at home daily. The period of intervention was 6 weeks, two sessions per week were provided to each child. The total number of sessions was 12 sessions to each child. The evaluation were done twice; the first time carried out at the end of session twelve immediately and the second time one month after that. The results of the two times of assessment before the intervention were similar; therefore the data of two times were integrated as only one time before.
**Statistical analysis:** Data were coded and tabulated using SPSS, version 22. The data analyzed using appropriate descriptive and inferential statistical tests. Qualitative data were expressed as frequency and percentage. A comparison between variables carried out by using Chi square and paired-sample t-test. Correlation among variables was done by using Pearson correlation coefficient. A p-value less than 0.05 were considered statistically significant.

**Findings**

Table (1) demonstrated that 70% of children, their age less than 10 years old with the mean of 8.7 ± 2 years. Less than three quarters of children (73.3%) were males, and 60% ranked as the first child.

Table (1): Percentage Distribution of Children’ Personal Characteristics (n=30).

Table (2) Comparison between the Total Mean Scores of Asthma Symptoms, Medications, FEV1 and Total Asthma Control Before, Immediate and One Month After Breathing Retraining Exercise.

The total mean scores of asthma symptoms control were improved immediate (8 ± 4.40) and one month after (12 ± 4.5) than before (29 ± 5.6). There were a highly statistically significant improvement between the total mean score of asthma control between before and immediate and before and one month after.

Discussion

The current study results revealed that more than two thirds of children their age less than 10 years and less than three quarters were males. These results supported by 9 who found that asthma was common in age less than 10 years and bronchial asthma was reported more common in boys than girls.

The finding of the current study showed that the total mean score of asthma symptoms control improved significantly immediately and one month after breathing retraining exercise compared with before. These findings goes in line with 10 and 11 who concluded that asthma symptoms control improved after performing breathing retraining exercises in children. From the researcher point of view, this improvement might be due to compliance of children on breathing retraining exercise for twelve sessions and also they did the exercise at home, in addition the caregivers tried to avoid exposure of children for asthma triggers as possible.

Two thirds of children and three fifth had completely controlled asthma immediate and one month after breathing retraining exercise respectively in comparison with the highest percentage of children had poorly controlled asthma before. This result goes in line with 12 who concluded that bronchial asthma is well controlled after breathing retraining exercise. From the researcher point of view that might be due to positive effect of the exercises on the respiratory rate that lead to improvement of ventilatory function and also avoiding asthma triggers as possible.

These results support the first study hypotheses which stated that children with bronchial asthma who will receive selected breathing retraining exercises, their symptoms will differ after practicing exercise than before.

It was found that the highest total mean score of quality of life was detected immediately and one month after compared to the lowest mean score before and these improvements were statistically significant. These results were consistent with 13 and 14 who reported that there were highly statistically significant improvements in total score of pediatric asthma QoL in children following breathing retraining exercise.

There were highly statistically significant negative correlations between the total score of asthma control and PAQoL before, immediate after and one month after breathing retraining exercise. These results were congruent with 15 who found that there were a relation between asthma control and quality of life scores in asthmatic children.

These results accept the second hypotheis of the study which stated that children with bronchial asthma who will receive selected breathing retraining exercises, their quality of life will differ after practicing exercise than before.

Conclusion

Breathing retraining exercises improve asthma symptoms control and all domains of quality of life among children with asthma.

The study recommended the following:

- Breathing retraining exercise can be used and integrated with the routine care for children with asthma with emphasize to be performed at home to improve asthma symptoms and quality of life.
- Educational pamphlets or booklets about the technique of breathing retraining exercises should be provided for children and caregivers in outpatient clinic.

Ethical clearance: A written approval was obtained from the ethics and research committee of the Faculty of Nursing - Cairo University. Written informed consent was obtained from the caregivers and oral acceptance from children was confirmed after explaining the purpose, nature and benefits of the study. Children were informed that participation in the study was voluntary; anonymity and confidentiality of the data were assured. Consent was taken from the main author of the current study tools (ACQ and PAQLQ).

Conflict of Interest: The authors declare that there is no conflict of interest.

Source of Funding: The fund was partially covered by the Faculty of Nursing.

Abstract

The purpose of the present study was analyzing public health, social economy and law enforcement efforts of the community around Poboya gold mine area. The research method was quantitative survey on the community around Poboya gold mine area, Palu. The sample was 125 people. The research variables were public health status, social economy, and law enforcement effort. The data analysis was descriptive analysis on each variable. The research result was the common health issues among the respondents in the past month were skin diseases (75.2%), ARI (65.60%), hypertension (42.40%) and cramping on legs/arms (35.20%). The public health status was mostly normal (IMT 18.5-25.0) (48.00%) and underweight (IMT < 18.5) (42.40%). The occupations were gold miners (52.00%) and farmers (38.40%). The respondents’ income was low, although most of the respondents were miners. The common types of crime around the gold mine area based on people’s reports were harassment (72.0%), fraud (68.0%), and prostitution (60.0%). The conclusion is gold mine location near human settlements causes health issues related to mining activities, such as mercury exposure and change of occupation and land conversion, as well as high crime rate in the mining area which raises concerns among the community around the mine area.

Keywords: Public health status, income, criminality.

Introduction

Traditional mining activities in Poboya, Palu have been happening since 2008. These activities have a positive impact, i.e. opening employment, but also negative impacts in the form of reduced environmental quality and potential of damaging conservation area, Raya Forest Park. The gold mine activities use mercury and potentially contaminate 400 thousand people living in Palu. A study by the Department of Health of Palu in 2014 showed that 7 of 10 samples of Clean Water Quality Standard wells in Palu had mercury content of 0.005 ppm¹.

Generally, traditional gold mines use mercury in mining activities to absorb gold from rocks. Mercury usage could impact public health², environmental degradation, which in the long term may reduce land productivity³. A previous study in Poboya found agricultural land conversion into gold mine area with very high level of mercury pollution⁴.

Economically mining activities give revenue to the state and local government. However, mining activities also have massive and significant environmental and social impacts. The research result shows that the land/soil damage level in the gold mine location is severe and causes physical environmental impacts, such as soil degradation, loss of nutrients for plant growth, reduced surface water discharge, high traffic causing road damage and air pollution.
Gold mine is an opportunity for farmers to get better quality of life because for most people farming only provides food while gold mining yields income. Agricultural production lowered in 2009 in Bombana mine. Beside due to drought caused by long dry season, it also happened because some farmers left their agricultural lands to be gold miners despite their lack of experience, in order to get instant revenue. Unlike agricultural activities which require a long time to reap the result, the income from mining can be obtained in a day.

Potential crimes in the community around the mine area are caused by a stipulation in Article 162 of Mineral and Coal Law, which regulates punishment for every person hindering or disturbing mining business only with reference to Article 136 on settlement of land rights. Environmental conservation. Many miners don’t pay attention to good mining techniques in terms of conservation of reserve, occupational health and safety, and environmental management.

The purpose of the present study was analyzing public health, social economy and law enforcement efforts of the community around Poboya gold mine area.

**Method**

The research method was quantitative survey on the community around Poboya gold mine area, Paluin 2019. The research sample was people living in Poboya Urban Village, Palu. The research sample was 125 people.

The research variables were public health status, social economy, and law enforcement effort. Public health status was measured by questionnaire to determine health issues in the past month related to mercury exposure, and assessment of the respondents’ nutritional status anthropometrically by body mass index. The social economic data of the society included occupation and income. The law enforcement effort was analysis of legal issues faced by the society related to the activities and presence of the gold mine. The data analysis was descriptive analysis on each variable using SPSS software.

Discussion

The research result shows that gold mining activities had risks against the environment, economy, social, and health aspects. Polluted environment slowly lowered public health. The common health issues among the community living around the mining area were ARI diseases, skin diseases, hypertension and cramping on legs/arms.

Another study shows that the disease types suffered by gold miners affect some body organs, causing symptoms of chronic and acute diseases. Moreover, mercury concentration in water, fishes, and vegetables is significantly related to health risks due to mercury exposure among people around community gold mines. Miners and community around mines are usually contaminated with mercury through direct contact with skin, mercury vapor inhalation and consumption of fishes exposed to mercury.

The research result showed that gold mining activities caused people to change their jobs from farmer to miner, but they still had low income. However, another study shows that gold mine requires a large number of workers, increasing the income of local communities. Lowered revenue of agricultural business after the mine opens is caused by increased wage as scarcity of agricultural workers because they switch to mining leads to increased wage. Change from farmer to miner and land conversion into gold mine were caused by economic demands. The study shows that gold mining is an occupation to improve and fulfill people’s economic needs. Gold mine fulfills and improves family welfare. Moreover, the negative impact of illegal gold mine is children choosing to mine gold rather than going to school.

One of the social impacts of gold mine was crime and the common type of crime was fight among miners. High crime rate in the mining area wasn’t addressed completely, increasing people’s concern. Fights among ulayat land owners and theft in houses of people who own a lot of gold cause people to worry. In terms of security, there were classes between native people and migrants which killed some miners, as well as theft. The study showed that there were some factors surrounding each type of crime, but it’s concluded that the dominant factors are needs (individual), situation and condition of mining community and opportunity. Regarding murder, the dominant factor was uncontrollable emotion. To prevent crime, the policy, task unit and miner group leaders guarded, checked and performed searches as preventative measures.
Conclusion

Gold mine near human settlement causes health issues related to mining activities, such as mercury exposure, and change of occupation and land conversion, as well as high crime rate in the mine area which worry the community around the mine area.

Prevalence and Risk Factors of Candida Albicans Infection among Group of Pregnant Women in Maternity Teaching Hospital in Sulimania City

Gona Othman Faris¹, Sallama Kamel Nasir²

¹Assistant lecturer, PhD student, Gynecologic and Obstetric department, Collage of Nursing, University of Sulaimani, kurdistan region, Iraq, ²Assistant professor, Gynecologic and Obstetric department, Collage of Medicine, University of Sulaimani, kurdistan region, Iraq

Abstract

Background: Vulvovaginal candidiasis (VVC) is a major reason for vaginitis throughout pregnancy, and it may lead to serious complications. A relation between candidiasis and preterm birth has been confirmed. Knowledge about the local epidemiology of VVC is crucial for disease management.

Aim of the study: To determine the prevalence and the risk factors of VVC in pregnant women.

Study design: Cross-sectional, non-experimental, descriptive study.

Method: One hundred pregnant women from the labor ward participated in this study carried out from 16th December 2016 to 16th April 2017. High vaginal swabs were used as samples, and cultured in Sabouraud dextrose agar, incubated at 36°C for 48-72 hours. Candida albicans culture was confirmed by germ tube production.

Results: Prevalence of VVC among pregnant women was found to be 26%, common within the age group of 33–40 years. Women of 2-4 gravidity were more affected. There was no association among parity, abortion, with candidiasis. Antibiotics, steroids, and diabetes mellitus are the major risk factors.

Conclusion: The risk of VVC was higher in women who had an unplanned pregnancy, irregular or no visits to antenatal care centers, steroid users and prolonged use of an antibiotic.

Keywords: Vulvovaginal candidiasis, prevalence and risk factor.

Introduction

Infections of birth canal are common throughout pregnancy and Vulvo-Vaginal Candidiasis (VVC) is the most common and frequently distressing infection for many pregnant women. Nearly 75% of all women experience at least an episode of VVC throughout their life, and repeated events occur in almost 50% of cases. The incidence of infections has greatly increased in recent times especially with the extensive use of antibiotics and immunosuppressive treatment.

Prevalence of VVC doubles up in the last trimester of pregnancy (because of high production or alterations in the level of sex hormones and deposition of glycogen in the vagina) and those with multigravida suffer significantly more than those with primigravida.

The exact mechanism of how gestation boosts candida colonization throughout pregnancy is still unclear. However, it is known that during pregnancy the levels of hormones like estrogen and progesterone are elevated. Progesterone has suppressive effects on the anti-candida activity of neutrophils, whereas estrogen has been reported to decrease the ability of
vaginal epithelial cells to inhibit the growth of Candida albican (CA) and drop the immunoglobulins in vaginal secretions causing increased vulnerability of pregnant women for this infection.6

Out of approximately 150 species of yeast, more than 20 species are known to cause infections in human, CA is the most important species among the other clinically significant ones like Candida glabrata, Candida parapsilosis, Candida krusei and Candida dubliniensis 7. Candida species live commensally on the skin, genitourinary tract and gastrointestinal tract. They are harmless in their human host until they overgrow and interrupt the human immune system 8. However, under certain conditions, some species exploit the host environment and cause disease.

Pregnancy brings yeast infections, often multiple ones per pregnancy. Candida and pregnancy often go hand in hand, but it often weakens the immune system of the mother making it easier for the opportunistic pathogens to cause illnesses or disease. Symptoms of VVC include dysuria, dyspareunia, enlarged or swollen vulva, white thickcurd-like discharge from the vagina, pruritus, irritation of the vaginal area, vaginal edema and erythematous 9.

Several risk factors can be associated with increased colonization of VVC in women like compromised immune system, HIV/AIDS, obesity, diabetes, pregnancy, frequent uses of antibiotics, corticosteroids, estrogens, oral contraceptive pills, intrauterine contraceptive device, vaginal douches, sponge, diaphragms, tight clothing, poor personal hygiene unprotected sexual intercourse and diet with high glucose content 3.

Candida albicans infection (CAI) is an important cause of morbidity in pregnancy which can cause abortion, chorioamnionitis, subsequent preterm delivery, premature rupture of membrane and low birth weight.

**Material and Method**

**Study area:** Cross-sectional study was carried out at the Maternity Teaching Hospital in Sulaimani city/Iraqi in a group of pregnant women.

**Study population:** One hundred pregnant women with more than 37 weeks of gestation with different age groups and socioeconomic status were enrolled in this study. The study was conducted over a period (from 16th of December 2016 to 16 April 2017). Inclusion criteria for selection of pregnant women was, more than 37 weeks, intact membrane and cervical dilatation > 3-4 cm.

**Data collection:** Data collection was done by direct interview of the study participants. For this, a questionnaire was constructed which include the socio-demographic characteristics, information’s regarding current pregnancy, previous obstetric history and other risk factors.

**Specimen collection:** High vaginal sterile cotton swabs was obtained from them and placed in a sterile container, which contained 2 drops of normal saline to maintain moisture and immediately transported to the Pharma Gen laboratory for diagnosis of CA by culture and germ tube test.

**Culture:** The swabs were inoculated onto Sabouraud dextrose agar (SDA) plates and incubated at 36°C for 48-72 hours in the laboratory. After 2-3 days of incubation, candida appeared as creamy, smooth, pasty, and convex colonies on SDA plate.

**Germ tube test:** This is a rapid method for identification of CA. A loop full of inoculum of yeast cells was obtained from an isolated colony from the surface of SDA plate and suspended in 0.5 ml of human serum in a sterile small test tube and incubated at 37°C for 3 hours. After incubation a drop of the incubated serum was placed on a slide covered by cover slip and examined under the microscope at 10X and 40X magnifications for the presence of short, slender, tube-like structures of yeast or candida cell (elongated daughter cells from the mother cell without constriction at their origin) projections extending from the yeast cells. If these features were seen, then the sample was called germ tube positive and if not seen the sample was considered as germ tube negative for the CA 10.

**Statistical analysis:** After data collection the questions of the study were coded, data entry was performed in an excel spreadsheet, and then the statistical analysis was performed using SPSS program, version 21. Data were presented in tabular forms showing the frequency and percentages of different variables. Chi-square tests were used to compare the categorical variables. Quantitative variables were expressed as mean ± standard deviation and comparison between groups was done by t-test and p values ≤ 0.05 were statistically significant.
Results

Out of total one hundred pregnant women in labor word, 26% had CAI. Table 1 summarizes the socio-demographic characteristics and the frequency of CAI. Age ranged from 17-40 years, mean age of women was 33.6±5.8 years which was significantly higher than the women without CAI (28± 6.1 years). Most women among the infection group were in the age group of 33-40 years compared to non-infection group (65.4% versus 21.6%), statistically significant.

The findings showed no statistically significant association between CAI and educational status, participant residency, economic status and occupation (Table 1).

Women with unplanned pregnancy had a higher occurrence of the infection, 21(80.8%) compared to women with planned pregnancy 5(19.2%). Women who had regular visits to Anti Natal Care (ANC) had a lower rate of CAI 5 (19.2%) compared to those who had irregular visits 12 (46.2%) or those who did not visit ANC at all 9 (34.6%) (Table 1).

No statistically significant association was found between gravida, parity, abortion and early neonatal death with CAI. Among the women with a positive history of stillbirth, the proportion of women who had CAI 5 (19.2%) was statistically higher when compared to those who did not have CAI 2 (2.7%) (Table 2).

*T-test

Table 2 shows the association between the possible risk factors like diabetes, steroid use and prolonged use of antibiotics and the presence of CAI. Among the women with a positive history of diabetes mellitus, 10(38.6%) had infection as compared to 6(8.1%) women who did not have infection. Participants who
had a positive history of steroid use, 13(50.0%) were more likely to have infection as compared to those without any history of steroid use 10(13.5). Similarly, the participants who had a positive history of prolonged use of antibiotics, 13(50.0%) were more likely to have infection as compared to those without any history of prolonged use of antibiotics 10(13.5).

Discussion

In the present study, 26% pregnant women participants had CAI, approximately one in every four women was infected which was higher than the study done in Kerkuk-Iraq and Lebanon. However, in the present study the prevalence of CAI in the pregnant women was slightly lower than found in other studies done in Nigeria and Turkey. In another related study on pregnant women in the United Kingdom, the prevalence of CAI was 12.5% as compared to 26% in this study.

In the present study, 65.4% in the infection group were in age group (33-40 years) while a prospective study conducted in the UK reported that CAI was more common in the age group (21-30 years). Another prospective study conducted in India revealed that women in the age group (21-25 years) had the highest frequency of CAI. On the other hand, another recent study on this infection found that majority of CAI during pregnancy was related to reproductive age group between 20-39 years.

Study reported that nearly half (35.9%) of pregnant women colonized with CAI were illiterate, while in the present study, education level did not have a statistically significant association with CAI. Half of the infected women with infection in our study belonged to barely sufficient socio-economic status, while another study done in Nepal found that CAI was common among moderate socio-economic status which constituted 85.7%. 
Our finding shows that half of the infected population are from urban areas (57.7%) and most of them were housewives (96.2%). The result of our study is consistent with a study done in India which found that CAI was more common among women living in an urban area which constituted (64%) and among housewives. The present study shows that unplanned pregnancy and irregular visits to ANC clinics were significantly associated with CAI. A similar observation was found in a study done in Saudi Arabia which reported that CAI was associated with irregular visits to ANC clinics during pregnancy.

In the present study among the participants who had CAI, 8(30.8%) had primigravida, and 13(50%) had multigravida. This finding is consistent with the findings of other studies. In the present study, among the pregnant women with the infection, 12(46.2%) had 1-3 which is consistent with the findings of a similar study undertaken in Kuwait that reported that 16% of pregnant women with the infection had 1-3 para.

In the present study, no association was found between early neonatal death and CAI, but a statistically significant association was found between infection and history of stillbirth. In the present study, 9 (34.6%) of the participants who had an infection of previous history of abortion; this finding was in contrast to the findings of a similar study undertaken in Kuwait that reported 33% of infection occurred in pregnant women who had no history of any abortion.

We explored the relationship between risk factors and CAI. The prevalence of infection was 50% among antibiotic users, as 13 out of 26 women who had history of prolonged antibiotic use recently had CAI compared to 10% in the participants who did not use antibiotics which is highly suggestive of a positive correlation between recent antibiotic use and development CAI. This relationship was also significant and in agreement with other studies that have linked candidiasis to ingestion of antibiotics. An association was found between diabetes mellitus and steroid use with CAI but an opposite result was found in a study that showed no association between these two variables with the infection.

**Conclusion**

*Candida albicans* is a common infectious disease in pregnant women with a high prevalence rate. Unplanned pregnancy, irregular or no visits to antenatal care centers, steroid use and prolonged antibiotic use are the major risk factors.

**Conflict of Interest:** Not

**Ethical Clearance:** The study was approved by the ethical committee of the University of Sulaimani/College of Nursing and by the ethical review committee of the hospital.

The Prevalence of Amblyopia and Refractive Errors among School Children in Diwaniyacity, Iraq a Population Based Cross–Section Study

Haider Aswad Layikh¹, Saif Abbas Saeed¹, Alyaa Abdulameer Kadhum³

¹Professor Assistant, College of Medicine, Department of Surgery, University of Al-Qadisiyah,
²Lecturer, College of Nursing, University of Al-Qadisiyah

Abstract

Objective of the study: Is to determine the prevalence of amblyopia and associated refractive errors in a sample of school-age children in Al-Diwaniya Province, Iraq, who are between 6 to 10 years of age.

Design and settings: This is a population based cross section study in Al-Diwaniya Province, Iraq from October 2017 to January 2018. Moreover, 6,742 school-age children are involved, after agreement with the local Ministry of Education Department, along with a team consisting of an ophthalmologist and two optometrists; they visit the school and conduct visual acuity examinations, using the E-test and refraction test, which are both auto- and -manual “with cycloplegia” for children suspected of decreased visual acuity. They do a slit lamp exam (with portable lamps), used to assess anterior segment, red reflex, and lens opacity with a fundus exam to exclude pathology of the eye.

Results: The prevalence rate of amblyopia is 2.2%. There is a significant association between errors of refraction and amblyopia (p < 0.001). The most common error of refraction is hypermetropia, followed by myopia and astigmatism.

Conclusion: Amblyopia is a major health problem in school-age children who need active screening programs, since early detection and treatment is vital; amblyopia is more prevalent in young age groups with a greater number of hypermetropic children.

Keywords: Paediatric ophthalmology, squint, amblyopia.

Introduction

Amblyopia, sometimes referred to as lazy eye, is clinically defined as the best corrected visual acuity at 20/40 or worse, even after application of the best corrective measures: this is in the absence of any ocular or neuronal abnormalities of the eye.¹⁻⁻⁵ This abnormality often happens during childhood, extending to about 10 years of age,⁶ so that early detection, with effective medical intervention, can offer acceptable visual improvement.⁷⁻⁻⁸ On the other hand, delayed recognition of amblyopia can lead to lifelong visual impairment which is difficult to correct.⁹ This visual defect is attributed to underdevelopment of the visual system during early life, in that development of the brain’s occipital visual cortex occurs during this critical period: it is linked to the availability of focused and clear visual signals at that point.³⁻⁻¹⁰ When a single eye is affected, versus a unilateral defect, two issues are involved: first, optical characteristics of either eye tend to have different “anisometropia;” second, the visual axes of the eyesshow a misaligned “squint.”¹¹ Bilateral lesions are infrequent and seen in settings when the retina is deprived of visual signals, such as media opacity and ptosis. Yet, when refractive errors involve both eyes, amblyopia may similarly affect both eyes as well.¹²

A review article published in 2010 reports that 6.8 million individuals worldwide are blind due to uncorrected errors of refraction, and that approximately 101.2 million are visually handicapped.\textsuperscript{13} Refractive problems are visual abnormalities that can affect persons throughout their lives, and represent the most frequent visual problem in most age groups. Children represent the main sector at risk of refractive abnormalities, as vision defects can negatively affect learning abilities and future job opportunities.\textsuperscript{13} The prevalence of amblyopia in the published literature is in the range of 0.7 to 5%, based on features of the population being studied, criteria of visual acuity, and Method of measurement.\textsuperscript{14,15} Amblyopia is regarded as the most frequent reason for monocular visual defect among young adults and children in Central Europe.\textsuperscript{16} Its prevalence in India is reported at 4.4% and in China at 1.9% from 5 to 15 years of age.\textsuperscript{17} Studies on the prevalence rate of amblyopia in nearby countries show: in Iran for example, the rate is estimated to be in the range of 0.2 to 3% among school-age children\textsuperscript{18,19}. In Saudi Arabia, the rate of amblyopia in these children is estimated at 3.9%\textsuperscript{20}.

Due to a lack of adequate data on the prevalence of amblyopia in school-age children in Iraq, as well as the absence of screening programs to highlight the possible correlation between refractive errors and the development of amblyopia in this sector, this study is designed, planned, and conducted in Al-Diwaniya Province of the Mid-Euphrates region of Iraq, along with a baseline study for comparison.

**Patients and Method**

**Sample selection and study design:** The study is cross-sectional: among the relatively large number of primary schools in the target region, Al-Diwaniya Province, 25 schools were selected randomly with a computer. The study was conducted from October 2017 to January 2018, when we were able to enroll 6,742 children. Inclusion criteria involves any child from 6 to less than 10 years. Any child 10 years or older is excluded from the study, as any child with motility defects or squint is also omitted from the study, with the SPSS program (Armonk, NY, USA) used for statistical analysis.

**Ethical issues:** The study is approved by the local ethical approval committee of Al-Qadisiyah University College of Medicine. A Formal Agreement is available by the local directorate, representative of the Ministry of Education, while informed consent is taken from all students who participate in the study, including their parents.

**Examining team:** Three teams conduct the examination process, with each consisting of one ophthalmologist and two optometrists.

**Examination:** Each child is examined for visual acuity with the Snellen E-test, and for refraction with an auto-electronic refractometer (Huvitz HRK-7000, Seoul, South Korea); before each measurement, the machine is calibrated with the manufacturer’s specifications, while manual refraction is used for cycloplegia (cyclopentolate 1% eye drops) for children suspected of decreased visual acuity; there is a slit lamp exam with a portable lamp to assess the anterior segment, thereof reflex, as well as lens opacity with a fundus exam to exclude eye pathology, with an ocular motility exam of the cover-uncover test to find misalignment, at which point the sample is concluded.

**Results**

The prevalence of amblyopia and errors of refraction in children enrolled in the present study is shown in Table 1. Overall prevalence of amblyopia in all study samples is 2.2%. There was some variation in the prevalence of amblyopia among children in different age groups, ranging from 1.8 to 2.5%; the higher rate is observed in children from 6 to less than 7 years of age. Hypermetropia is seen in 3.7% of the total number of children, which ranges from 3.0 to 4.4%. The highest rate of hypermetropia is found in children aged 9 to less than 10 years. Astigmatism is observed in 2.8% of all participating school-aged children, ranging from 2.1 to 2.6%. The rate of astigmatism is highest from 8 years to less than 10 years of age.

The association between errors of refraction and amblyopia is shown in Table 2 and Fig. 1. The percent of amblyopia is significantly higher in hypermetropic children than normal children ($p<0.001$), 26.2 versus 1.3%; the percent of amblyopia is significantly higher in children with myopia than normal children ($p<0.001$), 24.2 versus 1.6%. Moreover, the percent of amblyopia is significantly higher in children with astigmatism than normal children ($p<0.001$), 22.0 versus 1.7%. These results indicate a strong association between errors of refraction and amblyopia.
The relationship between visual refractive errors and amblyopia seems to lessen with age, as shown in Table 3 and Fig. 2. The percent of children with amblyopia, as related to hypermetropia, is significantly reduced from 30.9% in those from 6 to less than 7, and to 16.4% from 9 to less than 10 years of age. The percent of children with amblyopia linked to myopia is reduced from 31.6% at 6 to less than 7, to 19.4% in those 9 to less than 10 years of age. The percent with amblyopia and hypermetropia is significantly reduced from 27.8% at 6 to less than 7 to 16.3% at 9 to less than 10 years.

Discussion

This study shows two striking features. First, the prevalence of amblyopia in school-aged children is relatively widespread (2.2%). However, the association between errors of refraction and amblyopia was also highly significant. There is no screening program for amblyopia, so results highlight that it must be used by the Ministry of Health and Health Institutes to focus on refraction errors as early as possible and avoid development of amblyopia later in life.

The rate of amblyopia is variable in different communities; the prevalence of amblyopia in India varies from 1.1% in some regions to 6.6% in other regions. In South-Asian areas, the Chinese reports showed that prevalence rate ranges from 0.8 to 2.5% in various subsets of the population, as carried out by Chia et al. and Fu et al., respectively. In hospital-based research in Nepal, the prevalence is 1%. The prevalence of amblyopia in Saudi Arabia is higher than that reported in our study, 3.9 versus 2.2%. The rate of refractive errors in our study is between 2.4 to 3.7%, which is far less than reported in some Arab countries; for example, it is 13.7% in Saudi children, and 22.1% in Egyptian children.
In this study, we report that hypermetropia is the most common refractory error, followed by myopia and astigmatism. This finding is similar to that of other authors.\textsuperscript{[21]} We also find that amblyopia is most frequent with hypermetropia, as per Menon et al.\textsuperscript{[27]} However, this finding is different from that of other related authors,\textsuperscript{[28]} who find that astigmatism is the most frequent error of refraction associated with amblyopia.

Some authors raise the issue that amblyopia is more common in one gender, with the explanation based on social habits rather than pathophysiological differences between boys and girls, attributing some trends within community preference of taking better care of boys than girls.\textsuperscript{[21,29-32]} We cannot evaluate the association between prevalence rate of amblyopia and gender, due to a lack of evidence in published articles; if there is any suggestion that the condition is genetically linked, or that some acquired biologic factor may exist in the male or female gender, this leads to higher rates in one gender. Supporting our view is that some authors refer to higher rates in boys than girls,\textsuperscript{[21, 29, 30]} whereas, other authors record higher rates in girls than boys.\textsuperscript{[31,32]}

With vision of 20/20, amblyopia is treatable and preventable in a child’s age group.\textsuperscript{[33-35]} If neglected, amblyopia can cause monocular and binocular impaired vision\textsuperscript{[36-38]} with accompanying deterioration in quality of life (QoL). As such, early diagnosis and prompt rehabilitation are a priority. This goal is regarded by some countries as the hallmark of the Blindness Control Program.\textsuperscript{[34,35]}

Acknowledgment: We would like to express our deep thanks to all members of Diwaniya teaching hospital ophthalmology department who participated in examining the children and assist in doing this research.

Conclusion

Amblyopia is a major health problem in school-age children who need active screening programs, since early detection and treatment is vital; amblyopia is more prevalent in young age groups with a greater number of hypermetropic children.

Conflict of Interest: All authors declare no conflict of interest.

Source of Funding: The work was self funded.

Efficacy of the Health Belief Model and Multi-Dimensional Locus of Control Theory-Led of Influenza Vaccination among High School Students in Al-Nasiriyah City

Haider Hammed Hlail1, Raad KareemFaraj1

1Department of Community Health Nursing, College of Nursing, University of Baghdad, Iraq

Abstract
A randomized controlled trial was conducted by applying the health belief model and multi-dimensional locus of control theory (HBM-MLOC) of change to (1) examine the effect of the theory-led intervention in enhancing decision on influenza vaccine, (2) identify the association between students’ age, family’s socioeconomic status (SES), frequency of contracting influenza, subjective norms, and their decision on influenza vaccine. The study included a simple random sample of (152) male students (76), students for the study group and (76) students for the control group aged 15 to 20 years who were selected from the highschool of “ Al-Sadeqeen “ in The-Qar in the Iraq. Data were collected through a self-report instrument that included the demographic data, the survey based on the health belief model (hbm) questionnaire, and the multidimensional locus of control questionnaire. The study results revealed that the mean age for participants in the study group was 17.52 ± 1.20; more than a quarter age 18-years-old (n = 22; 28.9%). The HBM-MLOC-based intervention positively influenced the students’ perceived barriers to receive influenza vaccine, perceived benefits of receiving influenza vaccine, perceived susceptibility of contracting influenza, perceived severity of contracting influenza, the internal locus of control related to taking Influenza vaccine, the powerful others locus of control related to taking Influenza vaccine, and the chance locus of control related to taking influenza vaccine. In our study recommends to conduct similar studies over broader geographical regions throughout Iraq, incorporate the theory-based intervention that address the determinants of health; particularly the epidemics into the nursing curricula, and the necessity of community health nurses in Iraq to conduct community-based studies using theory-based interventions.

Keywords: Contagious disease, Influenza vaccination, health belief model.

Introduction
Influenza, commonly called “the flu”, is a contagious disease caused by a virus which spreads easily from person to person. Compared with other viral respiratory infections such as the common cold, influenza infection can cause severe illness and also precipitate serious and life-threatening complications. Influenza viruses infect many parts of the body, including the nose, throat and lungs. Influenza symptoms include fever, cough, sore throat, fatigue, muscle aches, headaches, runny nose and watery eyes. Although the fever and body aches usually last for 3 – 5 days, coughing and fatigue can persist for two weeks or more. The virus is highly contagious and is spread from one person to another by coughing, sneezing or talking. Influenza infections typically occur between October and April each year1. Typical influenza disease is characterized by abrupt onset of fever, aching muscles, sore throat, and non-productive cough. Typical influenza disease does not occur in every infected person. Someone who has been previously exposed to similar virus strains (through natural infection or vaccination) is less likely to develop serious clinical illness2. Yearly flu vaccination is the best tool currently available to protect against influenza (flu). While how well the flu vaccine works can vary, the Centers for Disease Control and Prevention (CDC) recommends a yearly flu vaccination as the first and most important step in protecting against...
flu and its potentially serious complications. Millions of people have safely received flu vaccines for decades. A flu vaccination does not guarantee protection against the flu. Some people who get vaccinated might still get sick. However, people who get a flu vaccine are less likely to get sick with flu than someone who does not get vaccinated. The vaccine effectiveness of seasonal influenza vaccines is a measure of how well the seasonal influenza vaccine prevents influenza virus infection in the general population during a given influenza season. During seasons when most circulating influenza viruses are similar to the viruses in the influenza vaccine, the vaccine can reduce the risk of illness caused by influenza virus infection by about 50-60% among the overall population. The objective of the present study was to evaluate the efficacy of the health belief model and multidimensional locus of control theory-led intervention in enhancing decision on influenza vaccination among high school students in Al-Nasiriyah city.

**Methodology**

**Design of the Study:** The research design for this study was an experimental, randomized controlled trial design. Control occurs to decrease the possibility of error and thus increase the probability that the study’s findings are an accurate reflection of reality and the researcher can reduce the influence also controlling extraneous variables enable the researcher to identify relationships among the study variables accurately and examine the effects of one variable on another.

**The Study Population:** The study population included high school students. The target population for this study was drawn from Al-Sadeqeen Secondary School for Boys, The-Qar Directorate of Education, for this study was drawn from Al-Sadeqeen Secondary School for Boys, The-Qar Directorate of Education, and high schools belong to The-Qar Directorate of Education were written in identical pieces of paper. These pieces were put in container and stirred well. A systematic random sample comprised of (152) male middle school students was divided into two groups. The number of elements in the population N = 450 students. Based on a medium effect size (0.25), a error probability of 0.05, and a power of 0.95, the number of groups is 2, the repetitions are 3, the minimum required sample size for each group would be 71. The researcher distributed (170) copies of the study questionnaire to the students. The returned questionnaires were 160. Eight copies were incomplete. So, they were excluded. The final sample size was 152. Thus, the response rate was 94.1 %. The final sample size n = 76 for each group. By dividing the population size by the desired sample size (450/152), the result is 2.96 which means that every 3rd student on the list would be included in one of the two groups.

**The Health Belief Model Questionnaire (HBMQ):** The health belief model questionnaire (hbmq) was used to measure the students’ health beliefs about taking influenza vaccine. The hbmq consists of 16 items, 6 of them for perceived barriers to influenza vaccine, one item for the perceived benefits of influenza vaccine, 3 items for the perceived susceptibility of contracting influenza, and 6 items for the perceived severity of influenza. responses are arranged on a 5-points likert-type scale from 1 as “strongly disagree” and 5 as “strongly agree”). Total scores range from 16 to 80, with a higher score indicating greater perceived barriers to influenza, perceived benefits of influenza vaccine, perceived susceptibility of contracting influenza, and perceived severity of influenza. the hbmq has shown satisfactory reliability and concurrent validity.

**Statistical Analysis:** The descriptive statistical measures of frequency, percent, mean, and standard deviation were used to describe participants’ demographics. The repeated measures analysis of variance (RM-ANOVA) was used to measure the difference in the constructs of the HBM.

**Results**

The age mean (Table 1) for participants in the study group is 17.52 ± 1.20; more than a quarter age 18-years-old (n = 22; 28.9%), followed by those who age 17-years-old (n = 19; 25.0%), those who age 19-years-old (n = 16; 21.1%), those who age 16-years-old (n = 14; 18.4%), those who age 15-years-old (n = 3; 3.9%), and those who age 20-years-old (n = 2; 2.6%). For the control group, the age mean is 17.89 ± 1.49; more than a quarter age 17-years-old (n = 20; 39.5%), followed by those who age 20-years-old (n = 16; 21.1%), those who age each of 16-years-old and 18-years-old (n = 13; 13.7%), those who age 19-years-old (n = 12; 15.8%), and one who age 15-years-old (n = 2; 2.6%). Concerning grade, more than a third in the study group are freshmen (n = 27; 35.5%), followed by seniors (n = 26; 34.2%), and juniors (n = 23; 30.3%). For the control group, more than a third are
each of freshmen and seniors (n = 26; 34.2%) followed by juniors (n = 24; 31.6%). As per the birth order, less than a third in the study group came in the first order (n = 23; 30.3%), followed by those who came in the third order (n = 22; 28.9%), those who came in the fourth order (n = 19; 25.0%), those who came in the fifth order (n = 16; 21.1%), those who came in the seventh order (n = 1; 1.3%), and those who came in the sixth order (n = 0; 0.0%). For the control group, more than a third came in the first order (n = 26; 34.2%), followed by those who came in the third order (n = 18; 23.7%), those who came in the second order (n = 17; 22.4%), those who came in the fourth order (n = 12; 15.8%), those who came in the fifth order (n = 10; 13.2%), and one who came in the seventh order (n = 1; 1.3%).

Regarding the SES, less than a half in the study group are of the upper middle class (n = 34; 44.7%), followed by those who are of the lower middle class (n = 23; 30.3%), those who are of the upper lower class (n = 18; 23.7%), and one who is of the lower class (n = 1; 1.3%). For the control group, more than two-fifth are of the upper middle class (n = 32; 42.1%), followed by those who are of the upper lower class (n = 21; 27.6%), those who are of the lower middle class (n = 20; 26.3%), those who are of the lower class (n = 2; 2.6%), and one who is of upper class (n = 1; 1.3%).

Higher score means lesser barriers to receive Influenza vaccine. Whether these represent significant differences is the job of the repeated measures (RM) ANOVA. There are significant differences in the values (Table 3) of the Perceived barriers to receive Influenza Vaccine for participants both in the study and control groups (F = 584.754, df = 2, p < .05 vs. F = 2.880, df = 2, p < .05). The Mauchly’s Test of Sphericity (Table 4) is significant (p < .05), which indicates that these data do not violate the Sphericity assumption of the univariate approach to repeated-measures ANOVA. So, we accept the assumption that the variances of the differences between levels are equal. There was a (a priori p = 0.01) significant difference (F (1.977, 136.390) = 29.349, p = 0.01) in the Perceived barriers to receive Influenza vaccine over time for participants in the study group. The omnibus effect (measure of association) for this analysis is .903, which indicates that approximately 90% of the total variance in the perceived barriers receiving.

### Discussion

This randomized controlled trial was implemented to enhance students’ readiness to receive Influenza vaccine by implementing the Health Belief Model and Multi-Dimensional Locus of control Theory-based intervention (HBM-MLOC). There was significant difference in the values of the Perceived barriers to receive Influenza vaccine over time for participants in the study group. The omnibus effect of for this analysis was .903, which indicates that approximately 90% of the total variance in the Perceived barriers receiving Influenza vaccine values is accounted for by the variance in the administered intervention. For the control group, there was no significant difference in the Perceived barriers of receiving Influenza vaccine over time. Participants’ perceived barriers to receive Influenza vaccine in the study group in the pretest time statistically differ from such barriers in the posttest I and posttest II. Such barriers in the posttest I statistically differ from these in the pretest time and posttest II. Such barriers in the posttest II statistically differ from these in the pretest time and the posttest I. This finding indicates the positive, constant effect of the Health Belief Model and Multi-Dimensional Locus of control Theory-based intervention (HBM-MLOC) in overcoming the barriers to receive Influenza vaccine for students. There was a significant difference in the Perceived Benefits of receiving Influenza vaccine over time for participants in the study group. The omnibus effect for this analysis was .468, which indicates that approximately 46% of the total variance in the Perceived Benefits of receiving Influenza vaccine values is accounted for by the variance in the administered intervention. For the control group, there was no significant difference in the Perceived Benefits of receiving Influenza vaccine over time. Participants’ Perceived Benefits of receiving Influenza vaccine in the study group in the pretest time statistically differ from such benefits in the posttest I and posttest II. Such benefits in the posttest I statistically differ from that in the pretest time and posttest II. Such benefits in the posttest II statistically differ from that in the pretest time and posttest I. There was a significant difference in the Perceived Susceptibility of contracting Influenza over time for participants in the study group. This results agree with\(^{9,10,11,12,13}\).

### Conclusions

The Health Belief Model and Multi-Dimensional Locus of control Theory-based intervention (HBM-MLOC) has a positive effect the Perceived barriers to receive Influenza vaccine over time for students in the study group. The HBM-MLOC enabled students to overcome the barriers to receive Influenza vaccine for students. The HBM-MLOC enabled students to outweigh the Perceived Benefits of receiving Influenza vaccine over their barriers.

Determinant of Personal Protective Equipment Practices on Construction Welders

Haris Setyawan\textsuperscript{1}, Isna Qadrijati\textsuperscript{1}, Seviana Rinawati\textsuperscript{1}, Tutug Bolet Atmojo\textsuperscript{1}. \\

Abstract

The construction sector has been the largest contributor to the occurrence of accidents around the world. One of the production processes in construction at risk of accidents and occupational diseases is welding work. In Indonesia, especially in Surakarta, there are still a number of welders in the construction sector who work without using personal protective equipment (PPE), while the welding work itself is a risky job in terms of health and safety. This paper examines the most influential predisposing factor towards the practice of personal protective equipment application on welders. Predisposing factors studied in this study were age, working hours, level of education, history of work accidents in welding, knowledge and practice in the use of personal protective equipment. Cross sectional study was employed in the study conducted from February to July 2017 in 20 construction site locations in Surakarta, Central Java, Indonesia. Data was collected through face-to-face interviews using a structured questionnaire. The research population consisted of 430 construction workers in 100 construction site locations of welding in Surakarta. The sampling technique employed was multistage random sampling one. Sample was taken from 20 locations in 5 districts of Surakarta, leaving 245 welders being the sample. The knowledge is the most influential factor surrounding the practice of using protective equipment on construction workers welding in Surakarta, Indonesia. A good knowledge of welders can increase the opportunities in the good practice of using personal protective equipment up to 6 times (p value=0.001, Exp.B=6.020).

Keywords: Predisposing factors, knowledge, practices, personal protective equipment, construction welder.

Introduction

The development of construction businesses in Indonesia has grown rapidly and was instrumental in the growth of the economy. Construction activities that do not implement safety aspects properly will have an impact on the risk of accidents. Based on data from the International Labor Organization (ILO), from 1996 until the year 2017, 1 worker in the world dies every 15 seconds due to a work accident while 153 workers experience pain due to work\textsuperscript{(1)}. In 2015, the construction sector was the largest contributor to the occurrence of accidents around the world. Prevention of accidents and occupational diseases are essential as a form of a company’s efforts to improve work productivity\textsuperscript{(2)}. The more workers’ complaints about illness, the larger the funds spent and the more time wasted for processes and medical expenses\textsuperscript{(3)}. One of the production processes in construction at risk of accidents and occupational diseases is the welding work. Toxic fumes resulting from welding work, consisting of a mixture of metal oxides, silicates and fluoride are harmful to the respiratory system, eyes and nervous system. Moreover, the intensity of the lighting is often too high at the time of the welding process, which can damage the lens and iris via inflammation\textsuperscript{(4)}. Fire-sparks during welding processes can cause sores and irritation to the skin and eyes. The inflammation can be prevented by using Personal Protective Equipment (PPE) appropriately while working. By the standards of Occupational Safety and Health Association (OSHA), it is mandatory for welding work in the construction sector to wear PPE when performing welding work; this consists of a protective tool for the face and eyes, a respiratory protection, safety...
helmets, gloves, eye protection, high-visibility clothing, safety footwear and safety harnesses. In Indonesia, especially in Surakarta, there are still a number of welders in the construction sector who work without using self-protection, while the welding work itself is a risky job in terms of health and safety.

According to the Precede Proceed Theory, human behavior is caused by three important factors, i.e. predisposing, enabling and reinforcing factors. Predisposing factors include knowledge and attitudes toward health, the traditions and beliefs of the community, level of education, socio-economic level and so on. Enabling factors include the availability of infrastructure or health facilities for the community. Lastly, reinforcing factors include attitudes and behavior factors of community leaders and religious personages. Some studies believe the predisposing factors are predominant against the practice of PPE application among welders. This research aims to examine the most substantial predisposing factor towards the practice of PPE application on the welder. Predisposing factors studied in this study were age, duration of work, duration of work, education level, history of work accident, knowledge and practice about the application of PPE.

Material and Method

Surakarta Regency, Central Java, Indonesia; 5 districts and 51 villages with population density of 13,636 people/km²; most of them work in the trade, agriculture, industry and construction sectors. Surakarta consists of 100 construction sites in 5 districts, wherein many workers don’t have a construction worker certificate especially in welding. Cross sectional study was employed in the study conducted from February to July 2017 in 20 construction site locations in Surakarta, Central Java, Indonesia. The research population consisted of 430 welding construction workers in Surakarta. The sampling technique employed was multistage random sampling one. Sample was taken from 20 locations in 5 districts of Surakarta, leaving 245 welders being the sample. The welders of this study has job to fabricate and assemble metal equipment and structures in building construction. Data was collected through face-to-face interviews using a structured questionnaire. Socio-demographics including age, working hours, level of education, History of work accidents in welding. The questionnaire in knowledge (20 questions) and practice of the use of protective equipment (20 questions) using closed ended questions in multiple choice were measured using a 4-grade answer choice. The highest score (4) was given to the strongly agree answer, while the lowest one (1) to strongly disagree. The scale of research data is included in the data category with proportion and percentages were used for expression, and then data tested using the chi-square for a bivariate relationship between variables. A multivariate logistic regression test was conducted to affirm which of the variables dominantly influence the use of protective equipment. P value of < 0.05 was set as the level of statistical significance. The test is performed using SPSS 17.

Findings

This research was conducted in Surakarta, Central Java, which included 20 construction sites of welding scattered in Banjarsari, Jebres, Laweyan, Pasar Kliwon and Serengan. The respondents in this study are part of a welder team whose the duty is to carry out welding work, either cutting or joining steel and aluminum. Table 1 shows the characteristics and predisposing factors in the use of PPE, which reveals that knowledge of PPE on welders is mostly in the ‘bad’ category. Table 2 shows only the knowledge level that indicates a significant correlation against the use of PPE. Table 3 shows that knowledge is the most influencing variable on the practice of PPE application among welders in Surakarta.

Discussion

Personal factors, social factors and the economic condition of a person are strongly related to a person’s behavior and decision-making process, especially when it comes to safety and usage of PPE while working\(8\). Bivariate results using the statistic test of the chi-square showed that there is no significant correlation (p-value=0.086) between age and usage of PPE. The result of frequency distribution showed that the welders under 40 years old have a personal protective equipment practice in good category (56.4%). The results of this research are different from some studies of welders aged above 40 years old who have a sound compliance in the use of protective equipment\(9\). Increase in age should also be in line with increased knowledge and awareness of the importance of health and safety in performing a job\(10\). Based on the results of the multivariate logistic regression, it’s exhibited that age is not the most influential variable against the practice of using PPE on the welder (p-value = 0507). Age is one factor that can alter one’s personal behavior and one’s behavior shaping. However, the age of a person without education, training and knowledge about adequate safety can also hamper how safely a person behaves in the workplace\(11\).

The number of working hours of labor is also correlated with productivity, health and safety in working customs\(12\). Bivariate results using the test statistic of chi-square indicate that the number of hours of work with the practice of PPE usage has no significant relationship (p-value=0.208) and the largest percentage of the results obtained on workers who have had hours of work less than 8 hours per day, have a good behavior in the use of protective tools themselves(51.6%). This is in line with the studies of safety in the workplace, that the accidents and occupational diseases are prone to occur in working hours of the work day beyond the regular 8 hours. The event happens due to longer exposure to hazards in the workplace, which in turn enlarges the possibilities of the risk of an accident. Violation of maximum limit of work-hours per day negatively affects mental and psychological stress causes including fatigue, decreased productivity and morale and the lack of concentration that are dangerous to safety in working practices\(13\). Test results based on multivariate logistic regression exposed that the number of working hours showed no effect on the practice of the use of the protector on workers welding section(p-value = 0178).
Indonesia is one of the developing countries that has yet to implement safety practices appropriately particularly in the construction sector. A study of the practice of safety in developing economic countries such as Saudi Arabia, Pakistan, Nigeria and South Africa showed that the level of education associated with the use of PPE was a bad category. The results using the bivariate statistic of chi-square tests showed that there is no significant correlation between the level of education with the practice of PPE usage (p-value = 0.06); there is no dominance against the application of PPE. In southeast Asian countries, which is one of the regions with low education levels education on the construction sector workers, influence of inferior education highly impacts the number of work accidents in the sector.

The construction sector is vulnerable to various accidents that could lead to injuries on workers. Bivariate results showed that history of work accidents in welding with the practice of PPE usage has no significant correlation (p-value = 0.915), whereas the results of frequency distribution confirmed that the welders who have a history a work accident have PPE usage in the category of good (53.1%). It can be indicated that laborers who have experienced an incident of wounds and injuries will possess better knowledge, memory and awareness about safety in the workplace compared to those who have never experienced any incident.

Lack of knowledge about safety at work could trigger a person to behave unsafely. Bivariate results using the test statistic of chi-square showed that education and the application of PPE has no significant correlation (p-value = 0.001). The results of frequency distribution revealed that the welder who has knowledge in PPE usage possesses good behavior in the good category (76%). Through the multivariate test, it is unveiled that knowledge has vast influence on the application of PPE (p value=0.001, Exp.B=6,020) which means that the knowledge of good practices of PPE may enhance the application of PPE (around 6 times better).

Knowledge of personal protective equipment is the most influential factor against the practice in the use of protective tools on construction workers welding in Surakarta, and a good knowledge of PPE has a good opportunity to increase the practice of using PPE up to 6 times (p value=0.001, Exp.B=6,020). Knowledge in the usage of PPE might be improved through training and simulation regarding self-protection. It is highly recommended for the 20 sites of construction to perform a standard operational procedure especially in welding practices, so that workers can avoid accidents and occupational diseases.

Is There an Association between 
Body Mass Index and Cervical Length?

Hawzheen Q. Jalal¹, Srwa Ismael Khalid¹

¹Department of Obstetrics and Gynecology, Maternity Teaching Hospital, Erbil, Iraq

Abstract

Objective: Assess the relationship between maternal body mass index and second trimester cervical length

Method: This is a prospective study conducted on 100 singleton women, aged between 18 to 34 years with mean age of 24.03 ± 4.34 from 2017 to 2019, all these women have their BMI measured in 1st trimester according to WHO criteria and cervical length measured in 2nd trimester (16-24 weeks)

Results: The rate of premature delivery among women aged ≥ 25 years was 52.3% compared to 35.7% among those aged <35 years (p = 0.097). The rate of premature delivery among women living in rural areas was 52.9%, compared with 41% among women living in urban areas (p = 0.363). The more the body mass index (BMI), the less the rate of premature delivery (p = 0.002) where it was 50% among thin women and 0% among obese women. Premature delivery was 89.5% among women with short cervical length and 32.1% among women with normal cervical length (p < 0.001). 19% of the women of the whole sample had short cervix but none of the women with normal weight or obese had short cervix.

Conclusions: This study demonstrates a relationship between BMI and cervical length suggesting that obesity may be associated with longer cervical length.

Keywords: Premature delivery, body mass index, cervical length, Female, Pregnancy.

Introduction

Obesity and cervical insufficiency are leading causes of morbidity in pregnancy¹. Over the past two decades in the United States, the rate of obesity has more than doubled from 15 to 33%². It is estimated that more than one in five women of reproductive age are obese (body mass index, BMI ≥30 kg/m²), and the rate of obesity continues to rise³. The prevalence of obesity among adults in the United States has increased from 12% in 1991 to 20.9% in 2001⁴. Obese women appear to have a lower rate of spontaneous preterm birth than normal weight women⁵. Prior data suggest that maternal obesity in pregnancy is associated with an increased need for labor induction, longer duration of labor, higher oxytocin and misoprostol requirements, and importantly, more frequent cesarean sections⁶. Obesity before pregnancy is associated with an increased risk of fetal acrosomia and prenatal mortality⁷, ⁸. The mother’s being leaner than average (underweight), on the other hand, is associated with an increased risk of delivering an infant who is small for gestational age and perhaps also the risk of preterm delivery⁹. Pregnancies among underweight or over-weight women are therefore often regarded as high risk pregnancies, and thin women are frequently advised to gain weight before becoming pregnant¹⁰. Nonetheless, the optimal weight or body-mass index for women who wish to become pregnant is not known⁹.

However, evidence regarding the association of maternal obesity and spontaneous preterm birth (SPB) is conflicting⁴. Although some studies suggest that obesity does not influence the rate of preterm birth at 37 weeks of gestation, other studies have found reduced rates of preterm birth in obese and morbidly obese patients⁴.

The prevalence of overweight and obesity is increasing among women of childbearing age¹¹. An estimated 22% of non-pregnant women 18–49 years of age in the United States are considered overweight (BMI25–29.9 kg/m²) and an additional 22% are classified
as obese (BMI >29.9 kg/m²)\textsuperscript{12}. Throughout pregnancy the cervix plays an important role in maintaining the fetus in utero and preventing premature delivery\textsuperscript{13}.

The length of the cervix may be useful in predicting the risk of premature delivery, with a shorter cervix predicting a higher risk. Traditional Method to evaluate the cervix in pregnancy are limited and unsatisfactory\textsuperscript{14}. Digital examination, the standard method, suffers from large variation among examiners. In contrast, transvaginal ultrasonography is a reproducible method of examination during pregnancy\textsuperscript{14}. A short cervix, traditionally defined as a transvaginal sonographic cervical length (CL) ≤ 25mm in the mid-trimester of pregnancy, is an important risk factor for preterm birth and has emerged as one of the strongest and most consistent predictors of preterm birth in asymptomatic women with a singleton or twin gestation\textsuperscript{15}. The current study assessed the relationship between first trimester BMI and cervical length measured between 16 and 24 weeks of gestation.

**Method**

This is a prospective study of 100 women with singleton gestation conducted in Erbil Maternal Hospital from October 2017 to January 2019.

Gestational age was calculated based on first day LMP and or early first trimester ultrasound. First trimester pregnancy BMI was calculated for women (BMI equal to weight in Kg/height in meter). Women were classified into the following groups according to WHO criteria:

- Underweight BMI less 18.5 kg/m²
- Normal weight BMI 18.5 to 24.9 kg/m²
- Over weight BMI 25 to 29.9 kg/m²
- Class one obesity BMI 30 to 34.9 kg/m²
- Class two or morbid obesity BMI ≥35 kg/m²

Cervical length measured in centimeter by ultrasound scan between 16 and 24 weeks of gestation.

**Inclusion criteria**

- All primigravida and those with miss carriage only aged between 18-35 years

**Exclusion criteria**

- Multiple gestations
- Previous cervical surgeries
- History of IVF
- Age less than 18 or more than 35 year
- No history of any medical diseases

**Statistical analysis:** Data were analyzed using the Statistical Package for Social Sciences (SPSS, version 22). Chi square test of association was used to compare proportions. Fisher’s exact test was used when the expected count of more than 20% of the cells of the table was less than 5. Pearson’s correlation coefficient was calculated to assess the strength of correlation between two numerical variables. A p value of ≤ 0.05 was considered statistically significant

**Result**

Hundred women participated in the study. Their mean age ± SD was 24.03 ± 4.34 years, ranging from 18 to 34 years. The median was 23 years. Table 1 shows that the rate of premature delivery among women aged ≥ 25 years was 52.3% compared with 35.7% among those aged less than 25 years (p = 0.097). The rate of premature delivery among women living in rural areas was 52.9%, compared with 41% among women living in urban areas (p = 0.363). No significant association was detected between the rate of premature delivery and the other factors like educational level (p = 0.268), and progesterone intake (p = 0.522) as presented in Table 1.

Table 1. Incidence of premature delivery by age, residency, education, and progesterone intake
Table 2 shows that the more the body mass index (BMI), the less the rate of premature delivery (p = 0.002) where it was 50% among thin women and 0% among obese women. The same table shows that the rate of premature delivery was 89.5% among women with short cervical length and 32.1% among women with normal cervical length (p < 0.001).

Table 3 shows that 19% of the women of the whole sample had short cervix but none of the women with normal weight or obese had short cervix. It is evident in the table that 66.7% of thin women had short cervix (p < 0.001).
**Figure 1** shows that there was a strong positive correlation between cervical length and the weeks of delivery. The more the cervical length, the more the weeks at delivery ($r = 0.708$, $p < 0.001$)

![Figure 1. Correlation between cervical length and weeks at delivery](image1)

The same pattern is observed in **Figure 2** where it is evident that the more the body mass index, the more the weeks at delivery ($r = 0.555$, $p < 0.001$)

![Figure 2. Correlation between body mass index and weeks at delivery.](image2)

**Figure 3** shows a positive significant correlation between the BMI and the cervical length ($r = 0.710$, $p < 0.001$).

![Figure 3. Correlation between body mass index and cervical length.](image3)
Discussion

BMI, which is derived from weight and height measurements, is one of the best markers of nutritional status and is used to classify populations from thin to obese\textsuperscript{4}.

In our study we found that the relation between BMI and cervical length is proportional, patient who have normal or high BMI, they do have normal cervical length, for example patients who have BMI >25 kg/m\textsuperscript{2} all of them have normal cervical length, while patients who have BMI <18.5, 66.7\% of them, they have short cervix. These findings suggest that maternal obesity early in pregnancy may be associated with longer cervical length, a possible explanation for the decreased rate of spontaneous preterm birth and increased rates of induction of labor and cesarean section among obese women. Importantly, these results will need to be replicated in larger cohorts of pregnant women undergoing universal second-trimester transvaginal ultrasound screening of cervical length before further inferences can be made.

Furthermore in our study we found out that 17 cases (89.5\%) who have short cervix, had premature delivery, An explanation for why pregnant women with a higher BMI may have a longer cervical length remains to be elucidated. Obese women may have a different physiology, endocrine environment, and profile of comorbid conditions compared to their normal weight counterparts, which could influence cervical length\textsuperscript{16, 17}.

However in other study conducted by YS Hanet al\textsuperscript{10}, they found that the average length of neonates delivered by obese mothers was significantly shorter than the average length of neonates delivered by mothers of normal weight, because of the high rates of preterm and LBW delivery in the obese group.

Conclusions

This study demonstrates a relationship between BMI and cervical length suggesting that obesity may be associated with longer cervical length. These results will need to be replicated in larger cohorts undergoing universal cervical length assessment.

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Kurdistan Board of Medical Specialties and administration of the Maternity hospital.

Effect of Bee Venom on MRSA Isolated from Patient’s Wounds at Tikrit Teaching Hospital

Hayder Mudheher Abbas¹, Marwa Adnan Hasan¹, Sinor Dalshad Ali¹

¹Assist. Lecturer, Department of Biology, College of Science, Tikrit University, Tikrit, Iraq

Abstract

The widespread prevalence of bacterial resistance to currently available antibiotics has led to search for non-antibiotic agent to combat infections caused by these bacteria. The goal of this study was to investigate the antibiotic effect of bee venom against Methicillin-resistant Staphylococcus aureus (MRSA). The results showed significant differences of inhibition zone of MRSA in vitro when increasing the bee venom concentration.

Keywords: MRSA, Methicillin, Staph. aureus, BV, Melittin.

Introduction

Staphylococcus aureus is one of the most important human pathogenes both in the hospital and the community¹. Since the beginning of the antibiotic era, S. aureus has been a privileged target of the therapeutic research and numerous antimicrobial agents, as well as vaccine attempts, were specifically designed to combat this bacterium²,³.

Methicillin-resistant Staphylococcus aureus (MRSA) is resistant to all currently available beta-lactam antibiotics. Although this pathogen emerged rapidly after the introduction of methicillin in clinical practice in the early 1960s, it only became public health threat during the 1980s⁴. Its expansion was accompanied by the acquisition of resistants to non-beta lactam antibiotics, which led some authors to suggest that beta lactam alone was not sufficient to promote MRSA dissemination in the hospital⁵.

Honeybee venom is a complex mixture of pharmacologically active chemicals⁶. Bee venom has been widely used in traditional medicine to treat various inflammatory disorders such as rheumatism, arthritis, tenonitis, fibrosis, lupus, multiple sclerosis and to dissolve scar issues⁷. In addition, several studies have reported its cytotoxic properties against various types of tumor cells⁸,⁹. Beside 88% water, bee venom consists of at least 18 pharmacologically active components including a variety of peptides [melittin, apamin, adolapin and mast cell deregulating (MCD) peptide], enzymes (phospholipase A2 and hyaluronidase), bioactive amines (histamine and epinephrine) and other non-peptide components (lipids, carbohydrates and free amino acids) minerals and volatiles⁹,¹⁰. The principal toxin and the major active peptide is melittin (52% of bee venom dry weight), a polypeptide consisting of 26 amino acid effects towards various cell types, including anticancer, anti-inflammatory, antibacterial and antiviral effects¹¹.

Materials and Method

Culture media: Swabs were taken from patient’s wounds (12 patients) who are in Tikrit teaching hospital, cultured on nutrient agar for 24h. at 37°C. After the expiry of the period, the bacterial growth will be obvious, samples of that growth were cultured on mannitol salt agar (which considered as selective and differential medium for the isolation), incubated for 24h. at 37°C. Then bacterial samples were streaked on blood agar to examine haemolytic activity.

All the media were prepared according to manufacturer instructions, sterilized by autoclave for 15 min. at 121°C.

Antimicrobial susceptibility test: Bacterial samples were taken from mannitol salt agar to McFarland solution, then bacterial samples were transferred to Mueller-Hinton agar by dipping swab in the solution and streaked it on the agar. By using a sterile forceps the Methicillin (antimicrobial) disc was placed on the surface of the inoculated plate. Three repetition plates were made. Each plate were incubated for 24h. at 37°C.
**Bee venom activity test against MRSA:** Bee venom was collected by using Electric Shock device. The electric shock makes the workers ajaculate venom from its sting into the plastic sheet on the glass plate. Bacterial samples were taken from mannitol salt agar to McFarland solution, then bacterial samples were transferred to Mueller-Hinton agar by dipping swab in the solution and streaked it on the agar. Four holes were made in the inoculated culture media of each plate and different concentrations of bee venom were injected in each plate holes (100µg-1mg) and (5,10,15& 20 mg). Three repetition plates were made for each concentration. The plates were incubated for 24h. at 37°C to see the results.

Multiple drug resistance bacterial infections are a worldwide burden and treatment of patients with traditional antibiotics is becoming increasingly challenging or ineffective\(^\text{12}\), as we can see in table (1) the Methicillin antibiotic have no effect on MRSA, this result is similar to the results of Lamyaa and Raed \(^\text{13}\).

The concentrations (100 µg - 1mg) of BV. showed no effect on the MRSA inhibition, but as showed in table (2) the (5,10,15& 20 mg) concentrations of BV. showed that the inhibition zone increased when the concentration of BV. increased \(^\text{14}\). Several studies have clearly demonstrated that bee venom and melittin (one of bee venom component) exhibit a broad-spectrum antibacterial activity \(^\text{15,16}\). Han \(^\text{17}\) found that Gram-positive bacteria were more sensitive than Gram-negative bacteria, This difference may be due to the different cell wall and membrane structure in both types of bacteria.

Melittin can penetrate the peptidoglycan envelope and reach the cell membrane of Gram-positive bacteria easier than in Gram-negative bacteria, which are protected by a lipopolysaccharide envelope\(^\text{18,19}\).
**Conclusions**

1. All isolates resist the Methicillin antibiotic.

2. Bee venom has a significant effect on MRSA, the inhibition increased when the concentration of bee venom increased.

**Interest Statement Conflict:** The authors declare that there is no Interest conflict.

**Ethical Clearance:** Taken from Faculty of Science Tikrit University committee

**Source of Funding:** Self

Evaluation the Effect of Bone Wax on Healing of Bone in Rats

Hiba Abdulaziz Shekho

1Department of Veterinary Surgery, College of Veterinary Medicine, University of Tikrit, Tikrit, Iraq

Abstract

The current study proceeded on twenty adult rats were used to evaluate the effect of bone wax on healing of fractured femoral bone. After anesthetized two holes were drilled on femoral bone of 20 adult rats of all animals and divided into two groups randomly treated group each hole was filled with bone wax, and the other was left unfilled as control. Sites of intervention were estimated by histopathology. This study evidence complete bone hemostasis was achieved immediately after the application of bone wax on fractured bone but this agent inhibit bone healing and osteogenesis and they made bony lesions in animal femoral bone. The data were analysis by using the SPSS version 24 showed a significant difference between bone wax and control groups.

Keywords: Bleeding, Bone wax, Orthopedic surgery, Fracture, Hemostasis.

Introduction

Bleeding during and postoperatively in orthopedic surgery poses a numerous intimidation to the animal life and can lead to serious unfavorable sequel if uncontrolled [1]. The surgeon should be known with the range of hemostatic agents available and their implementation during bleeding [2]. Topical haemostatic treatment was applied since ancient time. They used herbs, mixture of wax, grease and barley and also animal hides mixed with hot sand to stop bleeding [3]. Bone bleeding can be difficult to manage especially in highly vascularized bone such as the spine and sternum. Currently, bone wax is used as a mechanical tamponade to stop bone bleeding [4, 5]. Bone wax is a well-known topical hemostatic agent composed of beeswax (70%) and Vaseline (30%). Its hemostatic effect is based on physical rather than biochemical properties: it allows clot formation by stopping the blood flow from damaged vessels into the bone [6]. The chemical formula of bone wax is CH₃(CH₂)₁₄COOCH(CH₃)₂, and it is used to control massive bleeding in thoracic surgery, orthopedic surgery, neurosurgery, and craniofacial surgery [7]. The use of hemostatic agents is not free from health risks and complications can arise as a result of physical attributes of the hemostatic material like mechanical compression or due to phlogistic effects secondary to their chemical nature [8, 9]. The bone wax is pliable enough to be placed within a vascular channel and burnished, immediately tamponing the vascular source and achieves bone hemostasis [10]. It is insoluble and therefore non-resorbable, and it interferes with bone healing at the site of application and causes infection by decreasing bacterial clearance in cancellous bone [11].

The objective of this study was to evaluate the effect of bone wax on healing of fractured femoral bone.

Materials and Method

Experimental Animals: The experiment were performed on a twenty adult 4-month-old rats weighing 250 to 300g were housed individually in a controlled environmental condition including; temperature, light, and humidity. Animals were fed a standard diet preoperatively. Postoperatively, animals were fed a normal diet ad libitum.

Surgical Operation: The experiment was done under general anesthesia, each animal was injected intraperitoneally with (75 mg/kg ketamine 10% and 2.5mg/kg xylazine 2%) [12]. The left thigh and lower extremity were then washed and shaved, the surgical site was cleaned and disinfected using 10% Povidone Iodine solution, then under aseptic conditions a longitudinal skin incision was made over the lateral aspect of the left thigh and via the fascia lata. Then vastus lateralis retracted anteriorly and posteriorly the biceps femoral was wicked [13]. In the meantime the midshaft of femoral bone was evidence. Two holes, each 2 mm in diameter, were drilled into the diaphyseal part of femoral bone using a dental drill to secure each holes have equal depth and the drilling was done under Irrigation with saline to avoid overheating [7].
**Experimental Design:** The animals were randomly divided into 2 experimental main groups (treated and control) 10 animals for each group, the holes was filled with bone wax (Bone Wax,W31G, 12/Pkg - Ethicon, Inc.) and the other was left unfilled as control. The suturing of muscle was done by using of sterile natural absorbable, chromic catgut suture size 3/0 and suturing the skin by using of sterile natural non-absorbable, silk suture size 2/0.

**Histopathological Study:** Microscopic examinations of the bone healing were performed on all rats at 7, 14 days after treatment. Ten rats used for each group. The rats were euthanized and sacrificed at each time interval using an overdose of anesthesia. The left femurs were harvested and stored for analyses.

**Declaration**

Buffered formalin 10% wasa satisfactory fixative for femoral bone to 24 h [14]. Then the samples were washed in atap water for 24 h and incubated with four different decalcifying solutions: 10% EDTA (pH 7.4); 3% nitric acid; 5% nitric acid; and 8% hydrochloric acid/formic acid followed by neutralizing with 0.1% aqueous ammoniasolution for 30 min. Decalcification was performed under continuous shaking [15]. Changing of decalcifying solutions daily and a perfect time of decalcification was noted, the decalcification process was ended when the bone was easily penetrated through by a needle without any force [16]. After modulation the specimens in paraffin, sequent slices of 5 μm thickness were performed. The histological slides were then stained by hematoxylin eosin [17].

**Statistical Analysis:** By using the SPSS version 24 for Windows 10 pro, Sony Vaio laptop. The data were analyzed statistically and showed significant differences between the control and Bone Wax group (Table 1).

**Results**

After all animals of experiment were killed as scheduled, differentiation between two experimental groups were analyzed by using Friedman test.

In control group; the defect in bone specimens consists of granulation tissue, at the end of the first week (fig. 1). During the second week, the connective tissue contained rife less organized bony trabeculae with maturation of granulation tissue and collagen bundles was seen through the bony defect (fig. 2).
Discussion

In our experimental study, the histopathological findings 14 days after surgery offered a large empty space at the bottom of the defects, exemplifying bone wax residues. These results are inapproval with Solheim, et. al. (1992) and Sawan, et. al. (2010) who evidence alarge empty vacuole at bottom of bony defect; represent bone wax, which wasapplied in bony cavity created in rabbit model.

Allison, (1994) and Nooh, et. al., (2014) demonstrated a foreign body reaction to bone wax in the form of granulomatous inflammation and fibrous encapsulation with the inhibition of bone healing and osteogenesis. The inflammatory cells were composed oflymphocytes, macrophages, and foreign body, multinucleated giant cells.

It is agreement by Achneck, et. al., (2010) that bone wax increased infection rates and impaired the ability of bone to clear bacteria.

Bone wax is insoluble and therefore not resorbable, this agreement with Sudmann, et. al., (2006) which indicates that bone wax is not resorbable or biocompatible. It is also non-resorbable inspongiosum bone and muscleand it can induce chronic inflammation and marked foreign body reaction after application in the calcaneusand inhibits osteoblasts from reaching bony defects and interferes with bone healing at the site of application.

During study periods a comparison of bone healing between control group and Bone wax group, showed retardation and inhibition of bone healing. This established by deprivation of collagen fibers or bony trabeculae formation. This indicated that, bone wax prevent and inhibit osteogenesis. This result in approval with several of studies, which announced the action of bone wax as a mechanical barrier to bone regeneration.

Wellisz, et. al., (2008) and Vestergaard, et. al., (2010) found that, the bone wax was effective in stopping bone healing, it remains at the site of application and has a number of adverse effects, forming a physical barrier to bone healing.

In our experimental study the results showed, bone wax act as local hemostatic agents that decrease postoperative pain, edema and hematoma but in the same time inhibition the osteogenesis and retardation of bone healing, as well, bone wax cause foreign body reactions, serve as a nidus for infection and inflammation.

Conclusions

The results obtained from this study and other studies reflected Bone wax agents are utilized with caution to minimize blood loss during and post-surgery and their complication effect appear as bony lesion and prevention of healing.

Isolation and Diagnosis of Fungus Fungi from Blood and Skin Samples in Dhi-Qar Province

Iman Hadi Al-ffayyadh1, Ihsan Hameed Khudhair2, Amany Shakeir Jaber1

1Department of Pathological Analysis, College of Science, University of DhiQar, Iraq,
2Department of Biology, College of Science, University of DhiQar, Iraq

Abstract

About 60 clinical samples have been collected (40 of both sexes from Al Hussein Educational Hospital in Dhi-Qar and 20 UTI students). Also 40 samples from of patients with skin fungal infections (including skin scraps, nail clippings, and parts of hair). The morphological and microscopic results of the isolates revealed that 21 isolates were Candida spp (Candida spp.), while the rest of the isolates were isolated at different rates and less frequently in the citrus samples. The skin samples showed 5 fungal species causing represented in 9 species involve AspergillusflavusAspergillusfumigatus, Candida albicans, C. tropicalis, Microsporiumgypseum, M.nanum, M.canis, Trichophytonspp, Epidermatophyton spp. The study also nails are the areas that mostly are infected according other areas, this may be because of their ability to produce some enzymes such as Phospholipase which plays an important role in breaking through the host issues.

Keywords: Isolation, fungus fungi, blood, skin.

Introduction

The fungus is a eukaryotic organism, with approximately 50,000 species living in nature, of which 80 species are yeast and fungal, which cause many different diseases for animals and humans1. One of the diseases caused by fungi is the so-called “Mycosis”, which is usually a chronic and serious disease because the fungus grows slowly, including systemic, opportunistic, superficial, and other infections that affect people who have weak immunity2. Among these fungus is the importance of human health and the animal is the fungus (Dermatophytes), which is known as fungus Saprophytic on the materials of keratine in the skin and nails and hair and cause diseases. Keratinophilic fungi are able to produce enzymes to decompose keratin structures and destructing3. Studies indicate that yeast in the ovaries is existed naturally in the oral cavity of healthy people from 20% to 40% of its presence in the vagina and the respiratory canal and penis4. But its – and others - transformation is from other pathogenic fungi from organisms that coexist peacefully to opportunistic beings as a result of its ferocity factors that help it to become pathogenic organisms such as the production of proteins and lipid enzymes as well as adhesives on the surfaces of phagocytic cells5, and their susceptibility depends on the weakness of immunity in people with immune weakness, in such cases, such as HIV/AIDS, (Diabetes mellitus), tumors and the use of antibiotics for a long period of time, such as cortisone and others, it has caused many diseases, such as mucosal infections, which are widespread, including chronic skin injuries (Chronic mucocutaneous), and infections of Vaginal, penis, etc.

This study aims to:
1. Isolation and diagnosis of pathogenic fungi from the samples of urine in some people infected with UTI.
2. Identifying the most common types of UTI.
3. Isolation and Diagnosis of dermophytic

Materials and Method

Samples Collection: About 60 samples of urine from some people infected of UTI, and 40 skin samples (nail clippings, skin scraps, parts of hair) were collected from some people with urinary and skin infections from Al Hussein Educational Hospital in DhiQar and some from the Dermatology Clinics during the period from October 2016 - March 2017, samples were kept in test tubes in the laboratory for the purpose of examination and diagnosis.
Cultivation

A–Medium of Sibroids-Dextrose Agar (SAD):
The Center was prepared according the company instructions, and after the sterilization and cooling, this center has been used for isolating the fungus by transplanting the skin samples taken from the patients, then dishes were left in the incubator for 3 weeks at 28°C to allow the largest number of fungi to grow and appear for isolation and diagnosis.6

Isolation and identification: Urine samples have been cultivated on Sabouraud’s dextrose -Agar/oxide and Potato dextrose Agar by immersing the Loop in the sample and then plotting on the pre-prepared plant medium, work 3 replicates for each sample on the above-mentioned areas to ensure that the medium is free from contamination during implantation. Then incubated the dishes in the incubator at 37°C and checked weekly in three weeks.7 The samples were examined directly on the samples (skin scraps and nail clippings) by taking part of the samples on a clean glass slide containing 10% KOH and placing the lid on it and left in the laboratory for half an hour to dissolve the cretonne of the sample, then examined under the microscope to observe the spores and the fungal filaments on them, then all the fungal species and their associated species were then identified by Assist Prof. Mohamed Hashim Al-Mousawi/Faculty of Science/University of Thi-Qar, and relying on taxonomic keys according to 8,9. These included:

1. Direct microscopy of samples by adopting the method of 10,11.
2. Composition of spores and microbial pathology by adapting 12,13.

The percentage of the appearance of fungus in the urine samples was calculated according to the following equation:

\[
\text{Percentage of fungi appearance} = \frac{\text{Number of samples in which the fungus}}{\text{Total number of samples}} \times 100
\]

Results and Discussion

The study proved emergence of colonies growing on the medium Sibroids agar (SDA) in form of white colonies to brown and almost circular-shaped Candida genus. This is consistent with Sadie and his group 14,15 that the colonies of Candida. spp possess these qualities when cultivating them on the mentioned medium, in addition to the emergence of other species, including Mucor, Aspergillus Spp, Curvulariaspp, Cladosporiumspp, Pseudomonas, Enterococcus. In this study, the isolates, which were the most isolated species, were identified based on the microscopic and visual diagnosis of the medium of SDA which corresponds to 16,17 and during this study, the infection was identified in 20 samples of patients collected. 18 stated that Candida Spp was about 15% of all infections in the University hospital in Turkey with the Candidasis, while the average of Candidasis in this study was slightly higher than that reported by 19 which was 3.4% of the total samples collected by him and his group. Also Curvuraria, clodosporium, Mucor, Pseudomonasspp, Enterococcus spp have been isolated, and this is in line with 20, which shows that Staphylococcus, Candida and Enterococcus are among the most common pathogens of hospital-acquired infections in all sections of Italy. Candida was found to be the fourth leading cause of intrauterine infections in the United States of America 21. Candida infection was more frequent than isolated samples. This was agreed by 22. In this study, these isolates were extracted from urinary, which was 20 isolates of Candida and other fungi less frequently, similar to 18,23,24 as shown in table1 below:

</tbody>
</table>

The results of fungal species and genus isolated from skin samples have revealed emergence of fungal species including Aspergillus flavus, A. fumigatus, Candida spp, Microsporum canis, Trichophytonspp, Epidermatophyton spp, and this result is consistent with the findings. This study mentioned above has shown that Trichophytonspp, responsible for Tinea nail infection, more frequent among fungi and this is consistent with the findings of the researchers. The study also showed that the most common areas of the body are nails if they are isolated from fungi Candida spp, Microsporum canis, Trichophytonspp and Epidermatophyton spp. It may be due to its ability to produce some enzymes such as Phospholipase, which play an important role in penetrating host tissues. Candida spp. Yeast has been isolated which plays an important role in superficial skin injuries, especially in the nails and in systemic infections.

**Conclusion**

It is known that the fungi are eukaryotic organisms with metabolic processes and structures similar to hosts of other eukaryotes, including animals and humans, so it is difficult to treat the problems of fungi over the years, especially in superficial and deep skin injuries.

Waiting Time and Patient Satisfaction in Oral Diagnostic Polyclinic, Department of Dentistry, RSUPN dr. Cipto Mangunkusumo

Indira Larasputri¹, Endah Ayu Tri²

¹Staff of Department of Dentistry, RSUPN-CM Jakarta, Indonesia, ²Head of Oral Medicine Division, Department of Dentistry, RSUPN-CM Jakarta, Indonesia

Abstract

Background: The decline of patients in the Department of Dentistry by 2017 compared to 2016 indicated a problem with the quality of service. One of factors that affected patient satisfaction was waiting times. The length of waiting times could decrease patient perceptions of satisfaction.

Objective: To analyze waiting times and patient satisfaction in the Oral Diagnostic Polyclinic, Department of Dentistry, RSUPN Dr Cipto Mangunkusumo.

Method: A cross-sectional study was conducted on 70 respondents. Data was analyzed to calculate frequency distribution of variables and correlation between the survey and waiting time using Spearman test (p value<0.05).

Results: Response time and satisfaction survey on waiting time to dentist in this study didn’t fulfill the standards set by the Ministry of Health (<60 minutes for response time and ≥90% for survey). Some medical record also was found after the dentist examination. There was a significant relationship between the waiting time to dentist with patient satisfaction on waiting time to dentist (p=0.043, r=-0.242).

Conclusion: Increasing length of waiting time in oral diagnostic polyclinic, RSUPN-CM, due to medical record and dentist examination factor, could decrease patient satisfaction.

Keywords: Waiting time, Patient Satisfaction, Response Time, Public Hospital.

Introduction

National Central General Public Hospital Dr. Cipto Mangunkusumo (RSUPN-CM) is a type A hospital which is the highest referral center in Indonesia. Although in the current era of National Health Insurance imposed a tiered referral system, the high number of referrals to the RSUPN-CM lead the patient’s overload and waiting time enhancement ¹. Patients declining in 2017 compared to 2016 indicated a problem with the quality of service. Quality of service patient satisfaction assessment revolved around skills, attitudes, behaviors, facilities and waiting time ². Waiting time is one of the important points in health service aspect ³. Waiting time is how longer patient wait in the polyclinic before meeting with the medical staff. The length of waiting times could lead to a decrease in patient perceptions of satisfaction³, ⁴.

The type and quality of basic services for the patient had been established by the Ministry of Health through Kepmenkes No.129/2008 on Hospital Minimum Service Standard. In the regulation, the waiting time indicator in outpatient service is less than 60 minutes and patient satisfaction should be more than 90%⁵. In Indonesia, research on outpatient waiting time had been done.
RSUD Indramayu response time was 70.18 minutes\(^4\). Department of Dentistry in RSPAD Gatot Soebroto response time was 93.3 minutes\(^6\). In Malaysia, the length of waiting time on doctor was 70 minutes\(^7\). In Nigeria, the waiting time of most respondents was 90-180 minutes while the recommendation was 30 minutes\(^8\).

Every patient who was treated at the Department of Dentistry would be checked first in oral diagnostic polyclinic. Oral Diagnostic was the forefront of Department of Dentistry as every new patient or long-term patients every two years should undergo re-examination before delivered into appropriate field of dental specialization. The examination time in the diagnostic oral polyclinic was often prolonged and leads to treatment inhibition.

In conducting public services, the hospital was responsible for the quality provided, including the case of patients waiting time to received health services. This had been reflected in the vision and clarified in the first mission of RSUPN-CM which was to provide high quality and affordable health services to all levels of society.

**Objectives:** The purpose of this study was to analyze service waiting times and patient satisfaction surveys in the Oral Diagnostic Polyclinic, Department of Dentistry, RSUPN-CM.

**Materials and Method**

Cross sectional study was done to 70 respondents after ethical clearance has been approved by Health Research Ethics Committee, Faculty of Medicine, Indonesia University (Number:0718/UN2.F1/ETIK/2018). The study was conducted from March to May 2018 in the Integrated Outpatient Unit, Department of Dentistry, RSUPN dr. Cipto Mangunkusumo, Jakarta. Data was collected by questionnaires for satisfaction survey and direct observation for the analysis of waiting time in oral diagnostic polyclinic.

Data analysis used in this research was univariate and bivariate analysis. Univariate analysis was used to calculate frequency distribution of variables. Bivariate analysis was used to determine relationship between two variables using spearman test.

**Results**

A. **The Characteristic of Respondent:** Table 1 showed the most widely respondent’s age range was >46 years (41.4%). Most respondents were female (62.9%). Respondents came mostly for two reasons, doctor’s referral (55.7%) and willingness of their own (40%). National health insurance was the most payment used by respondents (72.9%).

B. **Satisfaction Survey:** Table 2 showed that 70 respondents were satisfied with polyclinic registration. A total of 92.9% of respondents stated the length of waiting time to the nurse was good and very good. There were 41 respondents stated that the length of waiting time to the doctor was good and very good (74.3%) but there were 25.7% of respondents stated fair. 58.6% of respondents stated that the conspicuousness of waiting time in oral diagnostic polyclinic was good and very good but there are 2.9% of respondents and 38.6% of respondents stated the conspicuousness of waiting time is poor and fair. The conspicuousness of waiting time is questions of patient about when exactly patient was called and how long it took to wait.

C. Waiting Time Analysis

1. The Length of Medical Record Found: The length of medical record found was the time difference between admission registration to medical records found. The median record value of the duration was 43 minutes with the range 3 minutes and 367 minutes.

2. The length of the nursing care: The length of the nursing care is the time the nurse need to do nursing care to the patient in the examination room. The length of the nursing care in this study showed a median value 10 minutes with a minimum value 3 minutes to a maximum value 15 minutes.

3. The length of dentist’s examination: The length of dentist’s examination is the time dentist needs to consult and perform a physical examination with a patient in the examination room. The median value of the length of dentist’s examination was 12 minutes with a minimum value of 5 minutes and a maximum value of 95 minutes.

4. Response time:

Table 3. Frequency of Outpatient Response Time in Oral Diagnostic Polyclinic, RSUPN-CM

<table>

</tr>
<tr>
<td>&gt;60</td>
<td>60 (85.7)</td>
</tr>
</tbody>
</table>

Response time is the time patient takes from registration in admission until examined by the doctor in the examination room. In this study, only 10 patients meet the ideal response time (14.29%) and 60 patients have more than 60 minutes (85.71%) for response time.

</table>

*Median (min-max)

Table 4 showed the frequency of waiting time outpatient oral diagnostic polyclinic. The patient took 17 minutes (minimum 3 minutes and maximum 301 minutes) for admission registration to polyclinic registration. Then the patient waited 30 minutes (with a minimum value of 0 minutes and a maximum value of 142 minutes) to obtain nursing care from oral diagnostic nurses. After that, the patient returned to wait 40 minutes (with a minimum grade 5 minutes and a maximum value 159 minutes) to obtain examination by an oral diagnostic dentist.

Table 5 stated 77% of patients who registered in the Admission before 10 am. From 77% patients, only 58.6% who reached the polyclinic before 10 am. This also showed a gap of time between patients registered in admission and in oral diagnostic polyclinic. This may be because the patient did a prior examination in another polyclinic then oral diagnostic polyclinic. Medical records found before 10 am was only 44.3%. There was a gap of time between medical record found and dentist’s examination start time in some patients. Nursing care had been done by nurse before 10 am only 40% and examination done by doctor only 18.6%. The dentist’s examination was performed in the absence of complete medical records.

Data distribution test showed all variables had abnormal data distribution. The correlation test between waiting time to nurse and patient satisfaction on waiting time to nurse was not significant (p > 0.05) Whereas, the correlation test between waiting time to dentist and patient satisfaction on waiting time to dentist was significant (p < 0.05). The r value -0.242 indicates the longer waiting time, the less patient satisfied and vice versa.

Discussion

In this study, most patients waited more than 60 minutes (85.7%), which were not suitable with Minimum Service Standards Hospital. Huang (1994) stated that patients were more satisfied when they waited less than 37 minutes. The length of response time (> 60 minutes) was due to large numbers of patients, frequent late-delivery medical records, limited examination room, lack of personnel, and the presence of internet connection problem. RSUPN dr. Cipto Mangunkusumo is an educational hospital where the medical personnel is an educators and also administration job who take time in hours of service.

Most patients in RSUPN-CM used national health insurance covered payment system. Based on national health insurance regulation, the patient was allowed to visit two polyclinics in one day. There was a gap between registration between admission and oral diagnostic polyclinic because the patient had been treated in other polyclinics then registered in dental polyclinic after. The outcome was the medical record obstructed and not arrived on time in oral diagnostic polyclinic.

Medical records were found in a long time for some patients that contribute to the length of waiting times because dentist needed medical records to take subsequent decisions on dental practice accurately for complex cases to determine optimal treatment. Unchecking medical history and past treatment were an extreme-categorized incident that could induce iatrogenic harm and endanger patient safety. Medical records were found frequently in 43 minutes. Ideally, the medical records have to be found less than 10 minutes.

In this study, the length of dentist examination was frequently 12 minutes. The dentist need more time if it required exploring psychosocial issues related to diagnose the disease. Slower and longer consultation was also associated with doctors being more likely to explore presenting complaints more accurately, prescribe less and offer more preventative advice. Communication was important because the good interpersonal communication was built to improve the positive response of the patient. Most nurses checked patients less than 10 minutes (90%). However, rapid examination could also be detrimental, as nurses did not understand that longer examination time was useful in order to identify patient factors better and strengthen patient and nurse relationships.

In this study, patient’s waiting time to the dentist is negatively correlated with patient satisfaction which means the longer the patient waits the more dissatisfy the patient would be. The patient stated only 74.3% satisfied...
for satisfaction survey for waiting time on doctor. That was not suitable with the standards set by the Ministry of Health (≥90%) 5.

The same statement also expressed by Anderson that patients were more satisfied when waiting time in the waiting room is shorter 18. Bleustein (2014) also stated that patient satisfaction was influenced by the length of waiting time. Increased waiting time also affected the perception of information, instruction and overall treatment by doctors. Most importantly, longer waiting time could actually reduce the patient’s perception of a doctor’s ability and the confidence expressed in the care provided. The doctor tardiness and patient complexity could also heavily impact waiting time19. Another study by Kreitz (2016) stated the same thing that the longer the patient waited would affect his satisfaction 20. Increasing waiting time in RSUPN-CM required follow-up either on system improvement or on facility improvement as of RSUPN dr. Cipto Mangunkusumo could improve the quality of patient care.

**Conclusion**

This cross sectional study concludes that the longer the patient waits the more dissatisfy the patient would be. The length of waiting time from admission to dentist examination exceeded the limit set by the Minister of Health (≤60 minutes). The medical staff and medical record factors became factors causing long waiting in oral diagnostic polyclinic

Spectrophotometric Determination of Nifedipine in Pharmaceutical Tablets Using Batch and Flow Injection Method Via Diazotization Coupling Reaction

Intisar M. Alsaeedi1, Sadeem S. Abed2, Yasmeen H. Muhamad3

1PhD Student, 2Assistant Professor, 3Lecturer Department of Chemistry, College of science, University of Baghdad, Baghdad, Iraq

Abstract

Batch and Flow injection analysis (FIA) spectrophotometric Method have been presented for determination of nifedipine (NIF) in pure and pharmaceutical forms. The Method were based on the diazotization coupling reaction of NIF with diazotized p-nitro aniline (DPNA) in the presence of alkaline medium. Red product was formed and measured at $\lambda_{max}$ 509 nm. All optimum conditions were studied for each method. Linearity of NIF was observed for batch 20-100 µg.mL$^{-1}$ and for FIA 5-120 µg.mL$^{-1}$ and the detection limits were 4.197, 1.326 µg.mL$^{-1}$ for batch, FIA respectively. The method offered a good sensitivity, accuracy and precision; FIA was more convenient than batch method because of the wider linear range moreover, the sampling rate was 28 injections per hour but less reproducibility than batch method. A comparison study was carried out between the proposed and standard Method by calculating students’ t-test and F-test indicated no significant differences between them, the suggested method could be utilized for pharmaceutical analysis.

Keywords: Nifedipine, p-nitro aniline, diazotization coupling reaction, flow injection analysis, spectrophotometry.

Introduction

Nifedipen (NIF) is calcium channel blocker and kind of 1,4-dihydropyridine (1,4-DHP), chemically known as dimethyl-1,4- dihydro-2,6-dimethyl-4-(2-nitrophenyl) pyridine-3,5 dicarboxylate. It is a yellow crystalline substance, insoluble in water but soluble in ethanol1, it undergoes photochemical oxidation when exposing to light, more sensitive to light in solution than in crystalline form2. NIF has abundant therapeutic activities; used in the management of hypertension, angina pectoris, and some other cardiovascular disorders3. Various analytical Method have been reported for determination NIF in pharmaceutical forms, and biological fluids, such as spectrophotometric4,5; spectrofluorometric6,7; electrochemical method8,9; liquid chromatographic method10,11 and recently flow injection analysis12. Determination of NIF by spectrophotometric technique considered as available and uncomplicated method that can use in routine analysis as quality control laboratories. This technique based on the reaction of drug with specific reagents to form colored product13,14. Diazotization coupling reaction is one of the important reactions that gives stable and rapid coupling organic product, with high sensitivity measured spectrophotometrically15,16. The suggested study described two spectrophotometric Method, batch and FIA for determination of NIF by diazotization coupling reaction through reaction of p-nitro aniline (PNA) with sodium nitrite and hydrochloric acid then the formed diazotized reagent coupled with NIF in the presence of alkaline medium, a colored product appeared directly and measured.

Experimental

Apparatus: Shimadzu UV Visible spectrophotometer (UVmini-1240 apan) was used for spectral and absorbance measurements, 1cm quartz cell, flow cell (Cecil) with 50µL internal volume and 1cm path length. Peristaltic pump with 6 channels (Ismatec, Labortecnik-Analytic, type CH-8152, Glatbrugg Zurich-Switzerland) to pump the solutions through flexible tubs (0.8mm i.d.), teflon tubes (0.5mm i.d.) were used to make different reaction coil lengths. Injection valve (Knauer, Germany) included 6-ports with different loops (Rheodyne, Altex210, Supelco USA) to inject samples. In FIA, two-channel manifolds were provided.
Materials: All the reagents, solvents and chemicals were of analytical grade. NIF as Pharmaceutical grade was supplied from Sigma chemical co. (Germany) and the Pharmaceutical dosage as tablets (Adalat®LA, 30mg, Bayer Pharma, Germany).

Preparation of Solutions

Hydrochloric acid solution (1M): Diluting 8.4mL of 11.97M concentrated hydrochloric acid (Thomas Baker, India 37%, M. Wt=36.46 g.mol⁻¹) with distilled water in 100 mL volumetric flask.

Sodium hydroxide solution (1M): dissolving 4g of sodium hydroxide (BDH, England, M. Wt=40g.mol⁻¹) using distilled water and complete the volume to 100mL with the same solvent.

Potassium hydroxidesolution (1M): Weighing 5.6g of potassium hydroxide (BDH, England, M.Wt=56.11g.mol⁻¹) and dissolved by the use of distilled water, transferred into 100 mL volumetric flask then completed to the mark with same solvent.

Ammonium hydroxide (1M): Diluting 7.5mL of 13.36M of concentrated ammonium hydroxide (Fluka, Switzerland, 25%, M. Wt=17.03g.mol⁻¹) with distilled water in 100mL volumetric flask.

Sodium carbonate (1M): Dissolving 10.6g of sodium carbonate (BDH, England, M. Wt=106g.mol⁻¹) using distilled water and poured into 100 mL volumetric flask made up to the mark with same solvent.

Diazotized p-nitroaniline (DPNA) solutions (0.007, 0.005M): The solutions of PNA (BDH, UK, M.Wt=138.126g.mol⁻¹) and NaNO₂ (Fluka, Switzerland, M.Wt=69g.mol⁻¹) were prepared freshly. Equimolar prepared by dissolving (0.0966, 0.0690g) of PNA followed by 3mL of HCl (1M) and (0.0483, 0.0345g) of NaNO₂ respectively in 100 mL volumetric flasks. The mixtures were chilled on an ice bath with shaking for 5 minutes, then made up to the mark with distilled water. The diazotized reagents were left to stabilize for 15 minutes.

Reduction nitro group to amino group in NIF: Reduced NIF solution was performed by weighing pure NIF 50mg and dissolved in 50mL of ethanol, transferred the solution into 150mL beaker; 20mL of distilled water was added then 20mL of conc. HCl(11.97M) and 3g of zinc powder. The solution was stood for 15min at 25°C then filtered in 100mL volumetric flask and completed with distilled water to get 500µg.mL⁻¹ stock solution and was ready for next experiments.

Preparation of pharmaceutical form samples: Commercial NIF (adalat-30mg) 20 tablets were weighted and grinded. The amount of NIF equivalent to 50mg was taken, dissolved in 30mL of ethanol. The solution filtered into a 50mL volumetric flask, washed and completed with ethanol into 150mL beaker and reduced as previously described. Working solutions of pharmaceutical tablets were made using distilled water.

General batch procedure: Various concentrations (20-100µg.mL⁻¹) were prepared from reduced NIF solution and transferred into a set of 10 mL volumetric flasks then added 1mL of KOH(1M) followed by 3mL of DPNA (5x10⁻³M). The solutions were mixed well and left 15min, diluted to the mark with distilled water. Red dye was formed and measured at 509 nm. For the optimization of conditions in all subsequent experiments, 40µg.mL⁻¹ of NIF was chosen.

General FIA procedure: Working solutions of NIF ranged from 5 to 120µg.mL⁻¹ were prepared. The solutions were injected in 100µL sample loop through a carrier solution of DPNA (7x10⁻³M) then mixed with a stream solution of KOH (0.1M). The flow rate was -1.9mL.min⁻¹, the stream solutions mixed together in 150cm reaction coil (Figure 1a). The red dye absorbance was measured at 509nm. Optimization of conditions was carried out using 40µg.mL⁻¹ of NIF.
Results and Discussion

It was found that NIF could be coupled with DPNA in alkaline medium to form a red dye measured at $\lambda_{max}$ 509 nm (Figure 1b). The chemical and physical parameters which may be affected the sensitivity and stability of colored product were optimized by studying one variable with time and established the others.

Optimization of Reaction Conditions

Batch spectrophotometric method: The optimum of conditions for the determination of NIF in batch method were studied. The optimum volume of HCl(M) was 3 mL which given high sensitivity, DPNA as diazotized reagent is rapid, available and stable reactant in diazotization coupling reaction, so it was necessary to study the effect of different volumes of DPNA-(5x10$^{-3}$ M), the optimum volume was 3 mL which suitable to get the highest intensity color and absorbance. The effect of alkaline medium in diazotization coupling reaction was confirmed by previous studies which proved the colored dyes were formed only after adding bases. Various types of basic were studied to select suitable one, NaOH, KOH, NH$_4$OH and Na$_2$CO$_3$ (1 M) were chosen and the results revealed maximum stability and sensitivity when KOH added. The influence of KOH volume was also studied, the maximum absorbance was observed when adding 1 mL of KOH. The order of adding NIF, DPNA and KOH solutions were considered and studied by selecting three different orders, the best was revealed in (NIF-OH-DPNA) order. It was important to measure how long the colored product can be stable, so the effect of reaction time was studied started from 3 to 40 min, the intensity of the color increased and reached the maximum after 15 min then stabilized for at least 40 min.
The Stoichiometry of the reaction product:
The structure of the red product was adopted based on Mole ratio method to investigate the stoichiometry of the reaction between NIF and DPNA. An equimolar (1.4×10⁻³M) of NIF and DPNA solutions were used, (Figure-2a) indicated the existence of 1:1 (DPNA:NIF).

![Figure 2a: The Stoichiometry of the reaction product using mole ratio method.](image)

Reaction mechanism of the method:
The proposed mechanisms described below, the reaction involving two steps the first one sodium nitrite reacted with p-nitroaniline in acidic medium, to form diazonium chloride ion the second step, the diazonium ion is coupled with NIF in alkaline medium to give red product

![Reaction mechanism](image)
Effect of FIA manifold: Selection of the best manifold for flow system is very essential, therefore various manifolds were utilized to perform the reaction when the 75μL of 40μg.mL⁻¹ of NIF was injected with total flow rate 1.9mL.min⁻¹ and 100cm reaction coil, the concentrations for DPNA, KOH solutions were 5x10⁻³, 0.2M respectively. The results revealed the manifold in (Figure 1a) given the best absorbance and was chosen for further experiments. The physical and chemical parameters were studied by varying one while the other parameters fixed and the injection sample repeated three times.

Optimization of the FIA System Parameters

Effect of chemicals variables: Studying the effect of different concentrations of each DPNA, KOH solutions were essential to improve the sensitivity of the adopted reaction. The range of (1x10⁻³-10x10⁻³M) of DPNA solutions was examined. Through the results in (Figure 2b), the optimum concentration was 7x10⁻³M given highest absorbance, therefore was chosen for further use. Different concentrations of alkaline medium KOH were also investigated ranged from (0.05-0.5M), the best concentration was 0.1M because it showed maximum absorbance (Figure 2c), so it was considered as optimum variable.

Effect of physical variables: The physical parameters have an effective role in FIA to produce high sensitivity. Flow rate was an important condition because of its influence on dispersion of sample zone, so different flow rates were selected from 0.7 to 3.2 mL.min⁻¹, the results showed that flow rate 1.9mL.min⁻¹ gave the highest absorbance and good precision (Figure 3a). After this value the absorbance would be decreased with increasing the flow rate because the high flow of the solutions may never gave the reactants enough time to mix with the sample zone, hence it get out the flow cell radially. For mixing the reactants and complete the coupling reaction, different reaction coil lengths was studied in the range of 25–250cm. The results indicated 150cm length of reaction coil gave the highest absorbance as shown in (Figure 3b) and established as optimum parameter, whereas increasing coil length higher than 150cm may cause increasing in dispersion resulting from dilution which was due to spending more time in the coil this led to decrease the absorbance in addition to increase the analysis time. The volume of the injected sample was investigated using five sample loops (75–250μL) it was shown that the injected sample of 100 μL gave the best absorbance, therefore chosen for further experiments, above this volume may affected on dispersion of the sample zone and caused no intermixing with the reagents streams led to drop of sensitivity and sampling rate (Figure 3c). After studied all variables, the sampling frequency or sampling rate can be calculated theoretically by measuring the time from the moment of sample injection to the appearance of the maximum absorbance. The calculated time was 2.15min; therefore the sampling frequency was 28 samples per hour.

Validation of the current method: Analytical characteristics; linearity, detection limit, sampling rate, correlation coefficient and relative standard deviation (RSD) of each method were calculated (Table 1). Comparison of batch with FIA Method, the latter is more convenient than the former method, more sensitive and wider linear range furthermore it was rapid (sampling rate 28 injections per hour), but less in reproducibility.

Accuracy and precision: Accuracy and precision of the proposed Method were estimated, three different concentrations of NIF were applied for batch and FIA with five replicate. The values of RE%, Rec%, and RSD% summarized in (Table 2) and indicated a good accuracy, and high precision for the two current Method.
Figur 3: Studying the influence of physical parameters in FIA method. a- Effect of flow rate; b- Effect of reaction coil length; c- Effect of injection sample volume.

**Pharmaceutical applications:** Batch and FIA Method were adopted to estimate NIF in pharmaceutical forms (tablets containing 30mg NIF) by taken three different concentrations of pharmaceutical dosages with five replicate, the results in (Table2) indicated a good precision and accuracy. To evaluate the efficiency of the suggested Method, a comparison study was carried out between the proposed and standard Method\textsuperscript{20} by calculating Student’s t-test and F-test\textsuperscript{21}. The results proved that calculated value less than theoretical one, so there was no significant difference between the Method (Table 2).

Conclusion

This study submitted new simple and sensitive Method (batch and FIA) for evaluation NIF in pure and pharmaceutical form via stable reagent PNA which is freely reacts to produce diazootizedre agent and coupling with NIF to yield red product. Each suggested Method were simple, rapid and effective without requiring any complicated steps like extraction, heating or difficult preparation. As compared with other expensive techniques, the proposed Method are economic and inexpensive with an excellent accuracy and precision. FIA method more convenient than batch method, the sensitivity was better and linear range wider and sampling rate 28 injections per hour. The proposed Method could be employed for routine analysis.

Abstract

Introduction: Poor working posture due to non-ergonomic handloom design might be a cause of musculoskeletal disorders (MSDs) in Samarinda Sarong weavers.

Objectives: This study describes the inconsistency of the present handloom used with weaver anthropometry data and presents a new design of handloom based on anthropometric dimensions.

Method: An anthropometric survey was carried out to determine the anthropometric dimensions of 50 female weavers. The existing handloom dimensions were also measured. The data were analysed using descriptive statistics (min., max., mean, median, mode, standard deviation and 5th, 50th and 95th percentiles), as well as distribution and uniformity. The Indonesian Standard for Workstation Design (ISWD) was used to redesign the chair and table of the traditional handloom.

Results: The traditional handloom dimensions were found to be incompatible with the body dimensions of the female weavers. This suggests that the weavers MSD exhibited could be due to this incompatibility. Based on the anthropometric data collected, we have redesigned the traditional handloom.

Conclusions: The anthropometric data of the Samarinda Sarong female-weavers revealed body dimensions ill-suited to current traditional handloom dimensions. We have redesigned the traditional handloom based on these findings.

Keywords: Anthropometric dimension, musculoskeletal disorders, ergonomic, working posture, redesign handloom.

Introduction

In several countries, the rising of musculoskeletal disorders (MSDs) prevalence resulted considerable costs for both health and the weaving industry.¹,² Recently, we reported that 85% of Sarong Samarinda weavers in Indonesia experienced MSDs prevalence, with incidence of low, moderate, and high ratings at 15.0%, 7.5% and 77.5%, respectively.³ Skeletal muscle pain was primarily detected in the lower neck, shoulders, upper hands, bottom, waist, thighs, calves and ankles.

MSDs were found to be associated with the education level, work experience, prolonged sitting time, work posture and body anthropometry. Work posture was the dominant variable responsible for MSD prevalence. Poor work posture may be caused by the ill-suited fit of the handlooms’ design to the anthropometry dimensions of the weavers.³

The risk factors of MSDs for the weavers are include awkward and static work postures, twisting and lifting motions, pushing and pulling motions, and repetitive work.²,³,⁴ Awkward and static posture problems are generally caused by non-ergonomic work equipment and workstation design,⁵ which greatly affected on performance and work productivity.⁶ This research describes the redesign of traditional handlooms, which is used by Samarinda Sarong weavers based on their anthropometric data.

Material and Method

An anthropometric survey was carried out to determine the anthropometric dimensions of 50 female weavers of Samarinda Sarongat East Kalimantan, Indonesia, from March to August in 2018.

Anthropometric dimensions of the weavers, i.e. sitting height, sitting eye height, sitting shoulder height, sitting elbow height, sitting mid-shoulder height, waist height, popliteal height, buttock-popliteal length, shoulder breadth, hip breadth, waist breadth, elbow-to-elbow width, forearm-hand length and upper limb length (maximum extended arm) were determined. While the handloom chair dimensions measured were height, depth, width, backrest tilt angle, upper backrest, lower backrest, armrest height and armrest length; the handloom table dimensions included surface height, surface width, surface depth, foot rest/step-on height, swing arm handle and the surface angle.

Data were analysed using descriptive statistics (minimum, maximum, mean, median, mode, standard deviation and 5th, 50th and 95th percentiles), in addition to distribution and uniformity. (7)

Results and Discussion

Demographic, anthropometric and current handloom dimension data: Demographic and anthropometric data of the weavers in this study are shown in Table 1 and Table 2, while dimension data of the current handloom (3) is shown in Table 3.

The proposed dimension of redesign handloom:

Based on the MSDs prevalence from the previous study, we consider the dimension of the current traditional handloom design. Seven dimensions for the chair design (seat height, seat width, seat depth, seat angle/backrest tilt angle, seat backrest height (upper), seat backrest height (lower) and armrest height and length) and six dimensions for the table design (table surface height, table surface width, table surface depth, foot rest/step-on, swing arm handle depth and table angle).

From in depth interviews with the female weavers, we found that only the table surface height dimension was detected as uncomfortable. We changed the table surface dimension and the rest of the handloom table dimensions remained the same as the original dimensions (Table 3). The proposed dimension of redesign handloom is shown in Figure 1.

**Figure 1. Construction of redesigned traditional handloom for Sarong Samarinda woman weavers.**

**Seat height:** The seat height is set to the non-adjustable height of 55.35 cm. It was designed using the 95th percentile of the popliteal height, as suggested by the ISWD, combined with the requirements of adding a shoe-heel allowance of 0.45 cm. The 95th percentile of the popliteal height of the weavers is 54.90 cm, while the handloom ‘step-on’ component is 0.45 cm because the weavers work without shoes.

**Seat depth:** The seat depth is set to 47 cm, as suggested by Molenbroek et al., Thariq et al., and Woo et al., to adhere to the 5th percentile of the buttock-popliteal length and the requirement that the seat depth should not exceed the buttock-popliteal length of the shortest user.
Seat width: The seat width of handloom chair is designed to be 42.45 cm with an allowance of 15% (6.3 cm), which translates to a seat width of 48.65 cm. The chair width constitutes the horizontal distance from the outer left side of the sitting surface of the seat to the outer right side. The seat width was designed using the 95th percentile of hip breadth.\(^{(15,18,17)}\)

Seat angle: The seat angle, or backrest tilt angle, is set to 120°, as this will reduce the occurrence of disc pressure as recommended from previous studies.\(^{(13-15)}\)

Upper backrest height: The upper backrest height (the vertical distance from the top side of the seat surface to the highest point of the backrest) is set to 47 cm, based on the recommendations to use the 5th percentile of sitting shoulder height.\(^{(18,14,19)}\) The upper backrest height is the key ergonomic element in the chair’s design, with its form and degrees important influences in improving sitting posture and maintaining a normal spine.\(^{(10)}\)

Lower and upper backrest heights: The lower and upper backrest heights of the handloom chair seat are set to 24.10 cm and 47 cm, respectively, based on the 5th percentile of sitting elbow height and the 5th percentile of sitting shoulder height measurements.\(^{(18,21)}\)

Armrest height and length: The armrest height and length are set to 37.45 cm and 37.00 cm, respectively. Appropriate height adjustments and sufficient armrest padding can reduce pressure on the undersides of the forearms and elbows. Unfortunately, some national standards provide missing or ambiguous information on the requirements for armrest design.\(^{(13)}\) These armrest height and length dimensions are based on the use of the 95th percentile of the sitting elbow height and the 95th percentile of forearm-hand length.\(^{(8)}\)

Table surface height: The table surface height for the redesign is set to 88.4 cm, using the 50th percentile of the sitting elbow height (vertical distance of the seat to the bottom of the elbow) plus the 95th percentile of the popliteal. The formula recommended by the ISWD\(^{(8)}\) is more suitable for the female weavers of the Samarinda Sarong than the formula proposed by Ismaila et al.\(^{(10)}\)

Table underneath the knees height: The height of the table underneath the knees (i.e. the distance between the bottom of the table and the knees of the user) is set to 25.50 cm based on considerations to use the 95th percentile popliteal height, which is 54.90 cm, added to the thickness of the handloom table (8.00 cm). This distance allows weavers space to perform “step-on” activities and to cross their legs.\(^{(19,22)}\)

Table surface: The ISWD\(^{(8)}\) recommends using the 95th percentile of forward arm reach, which was 73.00 cm in this study. Other standards suggest minimum work desk areas of 150 cm (Australia), 90 cm (Canada), and 70 cm (United States).\(^{(13)}\) However, the traditional handloom table surface width featured in this study is 92 cm, and the majority of weavers interviewed said they could operate comfortably within this space. Therefore, the width was not modified from this in the redesigned handloom.

Table surface depth: The table surface depth upholds the original dimensions of the traditional handloom (150 cm) because the weavers cited feeling comfortable with the original table surface depth dimensions in using the tool to roll the thread and stretch it into the swing arm handle. It is different with recommends the use of the 50th percentile of the forearm hand length to determine table surface depth\(^{(16)}\) or other recommended standards of the table surface depth minimums of 90 cm (Australia and Canada) or 50 cm (United States).\(^{(13)}\)

Swing arm handle depth: The swing arm handle depth also maintains the same dimensions as the traditional handloom at 33-37 cm. The swing arm handle is used to compress the woven thread and is operated by pushing and pulling the handle. The weavers reported being comfortable with the current swing arm distance, and it fits their anthropometric dimensions; therefore, it did not need to be modified.

Table angle: The horizontal table angle is set to remain flat at 0°. Chaffin\(^{(18)}\) suggests that the slope of the table surface has a positive impact on the neck, back, and shoulders, but that it must be adjusted according to its function. For reading and writing activities, users being able to adjust table tilt settings can reduce spinal flexion, which in turn reduces the risk of fatigue.\(^{(21,25)}\) However, the slope of the handloom table should be set to 0° to keep all components and materials sitting on the surface of the weaving table from falling off. Changing this angle will cause the table to slope, which can cause the components and material to shift, disrupting the weaving activities.

The limitation of the redesign traditional handloom: The redesign of the traditional handloom is expected to reduce the prevalence of MSDs in the
Samarinda Sarong weavers studied, similar to the results of the study by Purnomo et al.\(^{(20)}\) on redesigning school furniture. Choobineh et al.\(^{(21)}\) also showed that upholding appropriate workstation dimensions for carpet hand-weaving improved the weavers’ work posture and reduced incidence of MSDs. Currently, no data exists on the impact of redesigning traditional handlooms based on the work posture and MSD prevalence of the weavers. However, we are now preparing a follow-up study to test the handloom chair and table we developed in this study to determine how it affects weavers’ posture, comfort and MSD occurrences. The limitation of this study is that our handloom redesign is only applicable to users in the south eastern region of Asian because the anthropometry dimensions gathered exclusively reflect the Samarinda Sarong weavers of this region. However, the newly redesigned handloom may be usable for weaving workstations beyond traditional weaving products.

**Conclusion**

The traditional handloom currently used by female weavers making Samarinda Sarongs is not compatible with the anthropometric dimensions of these female Indonesian weavers. In this study, we redesigned the traditional handloom based on the anthropometry data collected from the woman weavers to fit the handloom dimensions to their body characteristics. The redesigned handloom is significantly different from the current traditional handloom in several ways. Moving forward, the new design needs to be assessed to determine if it will improve posture and comfort and reduce MSD occurrences in the weavers.

Alteration in Quality of Life after Kidney Transplantation

Niyan Hakeem Ismael1, Aso Omer Rashid2

1PhD student, Urological department, Faculty of Medical Sciences, College of Nursing,  
2Urological Department, Faculty of Medical Sciences, College of Medicine, University of Sulaimani

Abstract

Background: The surgical insertion of a human kidney from a cadaver or a living donor to a recipient with end-stage renal disease is called kidney transplantation, which can lead to recovery of the lost renal functions. This study was aimed to evaluate the changes in quality of life in patients with who underwent kidney transplantation.

Method: In a descriptive, prospective, single-center study with a longitudinal design, the quality of life of 50 patients with chronic renal failure who had kidney transplantation operation in Department of Urology at Shar Hospital, in Sulaimani city, was assessed before and after the surgery. Before transplantation, the patients also underwent hemodialysis. Ferrans and powers Quality of life Index (the World Health Organization) was utilized to collect the required data.

Results: Analyzing the collected data indicated that the patients perception of quality of life was not affected by the studied sociodemographic factors. It was also concluded that the dialysis period and post-transplantation period were significantly different with regard to physical, psychological, and spiritual domains, but not regarding the social domain. It was observed that was significant improvement in the quality of life regarding educational level and marital status. Moreover, the greatest change was observed in the general, satisfaction and importance variables.

Conclusion: It was concluded that the dialysis and post-transplantation periods were significantly different regarding domains of quality of life, but there was no statistically significant difference between them in terms of socio-economic domain of quality of life.

Keywords: Renal transplantation, quality of life.

Introduction

The term quality of life (QoL) was first utilized in clinical studies that were carried out in the 1980s 1. This term in medicine and public health is referred to as health-related quality of life (HRQOL) which is defined as the perception held by individuals on their position in relation to their expectations, goals, concerns, standards and in the context of the value and culture systems where they live 2.

With its prevalence of 5% to 8% worldwide, chronic kidney disease (CKD) is considered as a major indicator of poor health outcome resulted from non-communicable diseases. Kidney transplantation and long-term dialysis are the two significant treatments that patients with advanced chronic kidney disease (CKD) or end-stage renal disease (ESRD) are provided with 3. Research has indicated that renal transplantation can lead to major changes in every single dimension of the quality of life and the kidney recipients have to get accustomed with the changes in their lifestyle, they will have more time to meet new people because they do not need to undergo time-consuming dialysis anymore, and they can also go back to work 4,5. quality of life among renal recipients can differ largely given the specific personal characteristics and transplanting conditions 6. Therefore, all environmental, personal, and clinical factors which

Mobile Number: 00964(0)7701930039
could negatively impact HRQOL outcomes should be clearly specified and taken into account in future renal transplantations.

The World Health Organization have put emphasis on improving HRQOL among people that are suffering from chronic disease, and it has developed a specific program for ESRD patients. All renal (i.e., regulatory, excretion, metabolic, and endocrine) functions are recovered through renal transplantation; however, the recipients’ immune system can be suppressed permanently. It is stated that dialysis leads to only partial or intermittent elimination while there is no doubt that kidney transplantation is a quantitatively better method, although it is not risk-free. Since QoL among patients who undergo renal transplantation is affected by transplanting conditions and individual characteristics, it is necessary to come up with deeper understanding of such factors through descriptive studies in order to promote QOL among such recipients. In this regard, this study was aimed at evaluating the changes in quality of life in patients with ESRD who underwent kidney transplantation.

Method

The study was a prospective, descriptive study that was carried out using longitudinal design from November 2016 to November 2017. The statistical population included all patients with chronic renal failure who were referred to the Department of Urology at Shar Hospital, Sulaimani, and it is a public hospital in which kidney transplantation is performed, and the patients are provided with specialized care. Out of that population, a total of 50 patients with the age range of between 6 and 70 years were chosen as the study sample. In order to assess the perception of kidney recipients before and after transplantation, the required data were collected in two steps. In the first step, all the enrolled transplant candidates on the waiting list were interviewed, and in the second stage, the kidney transplantation patients were interviewed after minimum of two months from their surgery which is a necessary time for the patients to recovery and return to their daily life activities. Before the interviews, the objectives of the study were explained to all of the patients, and the consent form was filled up by those who agreed to participate in the study. In order to collect the required data were collected in a Shar hospital, the researchers referred to Shar Hospital and they utilized Ferrans and Powers Quality of Life Index (the World Health Organization) This index consists of 35 closed questions aimed at assessing the perceptions of QOL and two general questions about pre-and post transplantation health and QOL the first part of index evaluates different dimensions of quality of life: including physical function, physical role, role limitation caused by emotional problems, body pain, general health perceptions, social function, emotional wellbeing and energy/fatigue and the second part focuses more specifically on renal disease, effect of kidney disease, burden of kidney disease, work status, cognitive function, quality of social interaction, sexual function, sleep, social support, patient satisfaction and dialysis staff encouragement. The index is scored based on a six-point Likert scale ranging from 1 to 6, with higher scores indicating better QOL. This instrument is easy to understand, and its reliability has been tested in patients with renal disease and its Cronbach Alpha index was reported to be 0.88 which confirms its applicability for the patients of the present study.

In order to analyze the collected data, they were first organized using an electronic spreadsheet (Microsoft Office Excel) and then categorized, processed, and analyzed by importing them into SPSS/21 in so doing descriptive and univariate statistics were utilized, and one-way (ANOVA) and t-test were run the level of statistical significance was set at p< 0.05.

In order to take the ethical considerations into account, the study methodology was approved by the local College Review Board, Sulaimani Medical College, Sulaimani University, the Kurdistan Region of Iraq. Which ensures the confidentiality of all collected data. Development of this study followed national and international ethical and legal aspects of research in to human. Moreover, as mentioned before, the participants were given thorough information about the study’s methodology and objectives, and informed consent was obtained from them prior to data collection. They were also told that they had the right to quite the study whenever they wanted to.

Results

A total of 50 renal transplantation patients participated in the study. According to the collected sociodemographic data from the participants, it was observed that most of the patients (62%) were men, they aged 39.6 years (SD=15.8) on average, 74% were married 66% were illiterate; most of them (76%) were during the study period. The collected data also revealed that most of the patients (44%) had an average socioeconomic status (Table 1).

Analyzing the association between the patients' sociodemographic characteristics and their perception of general QOL before and after transplantation indicated that there was no significant relationship between their sociodemographic characteristics and their perception of general QOL before and after transplantation (p˃0.05). However, significant improvement was observed in level of education and marital status (Table 2).

Further analysis of the collected data indicated that the greatest change occurred in the general QOL, which was assessed through the overall importance with QOL and health satisfaction. The results revealed that the patients’ overall satisfaction with their and importance of transplantation underwent significant changes after the renal transplantation compared to the pre-transplantation status (Table 3).

Discussion

In this study, it was observed that most of the participants (74%) were young adults aging up to 25 years with a mean age of 39.6 years (SD=15.8); which is a worrying statistic highlighting the early development of kidney disease and its rapid progression among economically active young individuals. It was also seen that most of the patients (60.3%) in the present study had less than 8 years of formal education. Similarly, Kusumota et al. studied 107 chronic renal disease patients and reported of higher incidence of chronic kidney disease in older ages with mean age of 51.1 years. They also observed that a great part of the respondents (48.6%) had completed high school. In the present study it was also observed that 74% of the patients were married. Similar findings were reported by Bertolin et al.
and Kirchner et al. whose studies were participated by more than 50% married individuals or those who lived in a stable relationship. With regard to the participants’ occupational status, the results of the present study indicated that 74% were not working during the study period. Similarly, very few participants (6.7%) in the studies carried out by Cavalcante had a job, and most of them (80%) were retired in their study.

The results of the present study also indicated that some variables including female gender, older age, lower education, unemployment, diabetes, living alone, repeated hospitalization, and long duration of dialysis were associated with lower QoL scores. Similar findings were reported by previous studies.

According to the results of the present study, sociodemographic factors did not impact the perception of overall pre-and post-transplantation QoL among the patients. This finding is in line with that of the study carried out by Soza et al., who reported that sociodemographic factors and QoL after renal transplantation were not significantly correlated. According to study that compared the mean scores of QoL variables before and after renal transplantation, significant improvement was observed in general QoL. This data was based on the study by Kovacs et al., that carried out a study to compare quality of life among kidney transplant recipients and wait listed patients.

Bohlke et al. assessed health-related QoL issues in 262 renal transplant recipients, and they concluded that the physical component of QoL was affected by presence hypertension and diabetes, factors such as levels of creatinine and hematocrit, which improved after the transplantation. Their finding was consistent to this present study.

Social relation domain assesses the patients’ degree of satisfaction with their relationship and the time they spend with their family and friends and the support given by them. The results of this study revealed that the average score of this domain underwent a significant increase after transplantation. Valcanti et al., reported that social relationships have a strong impact on the perception of QoL, health welfare and susceptibility among the patients and help them deal with the disease process; therefore, the social relationship has been configured as a space for exchanging experiences, social protection and potential development.

Moreover, according to the psychological domain, the results of transplantation are reflected as the patients’ emotions and fears which demonstrate perceptions of coping strategies in situations of distress. In addition, the emotional aspects should be regarded as important indices of health and QoL in patients with chronic kidney diseases. Since patients’ daily activities might be limited by the changes in lifestyle imposed by the disease, treatment and progression of symptoms the patients’ perception of QoL will be affected negatively. Other researchers have reported that transplantation can lead to improvement in psychological factors. A significant difference was observed between pre-and post-transplantation states; which indicates improvements in this aspect. This result can be explained part by the safety and property conditions after transplantation; these results indicated that patients who had undergone renal transplantation had improvements in all dimensions of quality of life.

**Conclusion**

This study revealed that renal transplantation had a positive impact on changing the perception of QoL in the patients. Also, all domains of QoL improved after transplantation, especially those related to general QoL perception. Sociodemographic factors, however, had no significant influence on the participating patients, which indicated that transplantation was the main reason for changes in quality of life.

Family Empowerment with the Case Model on the Role of the Family and Exclusive Breastfeeding Behavior

Nurul Pujiastuti¹, Budi Santoso², Shrimarti Rukmini Devi³, Merryana Adriani³, Risa Etika²

¹Doctoral Student Faculty of Public Health, Universitas Airlangga, ²Fakulty of Medicine, Airlangga University, ³Fakulty of Public Health, Airlangga University, Surabaya, Indonesia

Abstract

Background: Family empowerment is an effort or process to foster family awareness, willingness and ability to recognize, overcome, maintain, protect, and improve their own welfare. Family empowerment in exclusive breastfeeding behavior is very necessary because exclusive breastfeeding is a world problem that affects infant morbidity and mortality.

Objective: This study aims to analyze family empowerment with the CASE model on family roles and exclusive breastfeeding behavior.

Method: Type of Quasy-experimental research by dividing two experimental groups namely the treatment group and the control group. Both groups are initiated with pre-test, and after the treatment is measured again (post-test). Statistical analysis uses multivariate analysis of covariance (Manacova) to test whether there are differences in treatment of a group of dependent variables after adjusting for the influence of confounding variables.

Results: For the pre-test results: family empowerment on the role of the family obtained a significance value of 0.229 and family empowerment of exclusive breastfeeding behavior obtained a significance value of 0.710 so that greater than 0.05 means that there is no linear relationship of family empowerment with family roles and exclusive breastfeeding behavior. For the results of the post-test: family empowerment on the role of the family obtained a significance value of 0.000 and family empowerment of exclusive breastfeeding behavior obtained a significance value of 0.000 so smaller than 0.05 means that there is a linear relationship of family empowerment with family roles and exclusive breastfeeding behavior.

Conclusion: Family empowerment with the CASE model is a support for mothers to exclusively breastfeed that can be used as a way to motivate and support pregnant women to have the intention to breastfeed exclusively since pregnancy.

Keywords: Empowerment, role, family, breastfeeding, exclusive.

Introduction

Exclusive breastfeeding is a world problem because exclusive breastfeeding affects infant morbidity and mortality. Exclusive breastfeeding at 6 weeks of age significantly reduced the likelihood of hospitalization for pneumonia and diarrhea¹. Breastfeeding can protect babies against the risk of asthma, eczema, rhinitis, and reduce the risk of otitis media in early childhood up to 40-50%²³. Exclusive breastfeeding reduces the risk of the incidence of ARI (Acute Respiratory Infection) 32,738 times⁴. Even so, only about 2/5 of babies worldwide are exclusively breastfed and only about two-thirds of babies are introduced to solid foods at the right time. WHO data shows that the average rate of exclusive breastfeeding in the world is only 38%. Data on exclusive breastfeeding in Indonesia is still below the national target (80%) which is 52.3% (2014), 55.7% (2015), and 54% (up to 6 months) and 29.5% (0-5 months) (2016). While the
Data of exclusive breastfeeding in East Java is 74% (2014), 74.1% (2015), and in 2016 there were 31.3% (up to 6 months) and 48.1% (0-5 months)\textsuperscript{5(6,7)}. Data on exclusive breastfeeding in Sidoarjo Regency is 54.5% (2014), 57.3% (2015), and 54.7% (2016)\textsuperscript{8(9,10)}.

Although many efforts have been made by the government, family support is needed because families with breastfeeding mothers need patience, time, and knowledge about breastfeeding. The most important family support is the support of each family member (husband / mother / mother-in-law), as well as other relatives who live in one house, which can have an impact at the beginning of initiation and the duration of breastfeeding\textsuperscript{11(12,13)}. Family empowerment is an effort or process to foster family awareness, willingness, and ability to recognize, overcome, maintain, protect, and improve their own welfare\textsuperscript{14}. In several studies, it is shown that family empowerment can improve family coping\textsuperscript{15} and change the behavior of family members\textsuperscript{16}.

The research objective was to develop family empowerment method through a family guidebook, analyze the use of family empowerment guidebooks on family roles and exclusive breastfeeding behavior in the control group and treatment group. pre-test and post-test are conducted for both groups.

### Materials and Method

Type of Quasy-experimental research. In this design, the experimental group was treated while the control group did not. In both groups the pre-test is taken place, and after the treatment is measured again (post-test)\textsuperscript{17}. The sampling technique used is multistage sampling. Multistage shows several stages of sampling. Stage 1 selects the sample and sample size according to certain criteria with the cluster. Phase 1 cluster is district. Phase 2 determines the public health center cluster. Large sample collection is like stage 1. Stage 3 is the village, etc\textsuperscript{18}.

The next stage, using purposive sampling technique is a sample selection technique by determining research subjects who meet the research criteria. The sample was chosen by choosing a family with 30 respondents in the final trimester pregnant mothers. Then included in the control group and the treatment group of 15 respondents each. After that the control group and treatment group were given pre-test for 60 minutes. The treatment given was an explanation and implementation of a family empowerment guidebook with the CASE model. Treatment is given for 3x60 minutes which includes explanations and demonstrations carried out by respondents. Evaluation (post-test) is done when the baby is 1 month old.

Intervention effect analysis uses multivariate analysis of covariance (Manacova) to test whether there is a difference in treatment of a group of dependent variables after adjusting for the influence of confounding variables.

**Findings:** According to Sulistyani (2004) family empowerment aims to form individuals, families, or communities to become independent. Independent in thinking, acting, and controlling what will be done. It is shown by the ability to think, decide and do something that is considered appropriate so that the problems can be resolved\textsuperscript{19}.

Important reasons for family empowerment include: the family as the smallest social system that can influence and be influenced by a wider social system; the family is the basic unit of society so that it determines the social and health system of the community; families are able to adapt (respond to, change, develop, act and modify their environment); families help determine the decision to achieve individual and family goals\textsuperscript{20}.

a. Design: Z1 + group, b. Exact statistic
The analysis shows that the F value for the Hotelling Trace group, has a greater significance than 0.05 which means it is not significant. Meaning that there is no difference in family role (y1) and exclusive breastfeeding behavior (y2) between the treatment group and the control group after controlling for the promotion of formula milk (Z1).

The interaction between family empowerment and promotion of formula milk on the role of the family obtained a significance value of 0.296 so that it was greater than 0.05, meaning that there was no influence of family empowerment and promotion of formula milk on the role of the family. The interaction between family empowerment and promotion of formula milk on exclusive breastfeeding behavior obtained a significance value of 0.205 so that it was greater than 0.05, meaning that there was no influence of family empowerment and promotion of formula milk on exclusive breastfeeding behavior. The treatment group has not been given a family guidebook so there is no difference between the treatment group and the control group.

2. Post – test analysis results

The analysis shows that the F value for the Hotelling Trace group, has a smaller significance than 0.05 which means significant. This means that there are differences in family roles (y1) and exclusive breastfeeding behavior (y2) between the treatment group and the control group after controlling for the promotion of formula milk (Z1).

a. R Squared = .993 (Adjusted R Squared = .993), b. R Squared = .938 (Adjusted R Squared = .933)

The interaction between family empowerment and promotion of formula milk on the role of the family obtained a significance value of 0.000 so that it was smaller than 0.05, meaning that there was an influence of family empowerment and promotion of formula milk on the role of the family. The interaction between family empowerment and promotion of formula milk on exclusive breastfeeding behavior obtained a significance value of 0.000 so that it was smaller than 0.05, meaning that there was an effect of family empowerment and promotion of formula milk on exclusive breastfeeding behavior.

Family empowerment with the CASE model can enhance the role of families in supporting exclusive breastfeeding behavior. Family empowerment can improve family functions which ultimately can make the family independent\(^{(21)}\). Family empowerment is a form of family support for pregnant women so that mothers can breastfeed exclusively after giving birth. Factors that influence maternal intention to breastfeed are knowledge, trust (stigma about breastfeeding), and family support (husband, members, family members, and relatives). These factors affect the continuation of breastfeeding in the first month of postpartum\(^{(22)}\). The most important family support is the support of each family member (husband / mother / mother-in-law), as well as other relatives who live in one house, which can have an impact at the beginning of initiation and the duration of breastfeeding. Breastfeeding mothers need informational support, assessment support, instrumental support, and emotional support from the family (mother / mother-in-law) to improve breastfeeding\(^{(23)}\).

Family empowerment means to provide knowledge, understanding and practice the material in the family guide book. The family guide book contains things related to the role of the family, breastfeeding behavior, stages of breastfeeding, conditions often encountered in breastfeeding, and dairy breast milk. After being given the material in the guidebook and practicing it, it is hoped that the family can motivate and support pregnant women to exclusively breastfeed.

**Conclusion**

The use of a family empowerment guidebook with the CASE model has a linear relationship with family roles and exclusive breastfeeding behavior.

Family empowerment increases the role of the family (family support and intentions of pregnant women for exclusive breastfeeding) and increases exclusive breastfeeding behavior (knowledge, attitudes, actions).

This shows that family empowerment can be used as a family guide to support pregnant women to exclusively breastfeed.

Marx, 3, Kursk, Russia, 305000, ³Laboratory of digestion and interstitial metabolism, All-Russian Research Institute of Physiology, Biochemistry and Nutrition of Animals, Institute of Village, Borovsk, Russia

Abstract

The aim: To evaluate the developmental dynamics of the hemostatic properties of platelets in rats with a low amount of antioxidants in their diet. The study took 116 healthy male Wistar rats, which during their lives contained on a standard diet, not rich in antioxidants, under normal vivarium conditions, including 23 rats of 3 months of age, 22 rats aged 6 months, 24 rats aged 12 months, 22 rats 18 months of age and 25 animals at the age of 24 months. In rats, their general state and parameters of biochemical and hematological blood parameters were determined. The results were processed by student’s criterion. In the rats examined, the biochemical parameters of platelets and their activity remained stable between 3 and 6 months of life. The intensity of lipid peroxidation in the platelets of the observed rats remained normal until 6 months of age, and subsequently increased. In the blood plates of animals over the age of 6 months, the processes of self-assembly of the actin-myosin complex intensified and the content of platelets increased and the secretion of adenosine phosphates from them increased. Platelet activity in rats that are on the course of ontogenesis on the diet of not rich with antioxidants, grew older than 6 months and increased until the end of the observation-24 months.

Keywords: Ontogenesis, rats, platelets, aggregation, hemostasis, intravascular platelet activity.

Introduction

It becomes clear that platelet activity plays an important role in the vital processes of the body at any age¹. No doubt that it is extremely important for hemocirculation through the capillaries, necessary for the growth and implementation of certain hereditary characteristics and properties². It is clear that they are sensitive to environmental factors through activation of their hemostatic properties³,⁴. Their ability to aggregation is highly dynamic and regulates blood rheology, and, consequently, the level of its revenues in tissue⁵,⁶. For many research and practical action have a very great significance of ontogenetic changes in the level of activity of platelets. This is especially important because of their involvement in the provision of microcirculation. It is known that their properties deteriorate in terms of diet with a low content of antioxidants⁷,⁸. This situation is highly relevant for assessing aspects of their participation in the formation of cardiovascular and metabolic diseases in humans at any age⁹,¹⁰. For this reason it is necessary to assess age-related changes in platelet activity for the life of the available and commonly used in the scientific works of laboratory rats in which the diet can be set in full compliance with the objectives of the study. The identified information will be very useful for experiments on the search for corrective effects on platelet activity at any age¹¹ and any pathology¹²,¹³ with a very careful migration patterns obtained in studies conducted with human participants. In this context, the aim of this study was to assess ontogenetic dynamics of

the hemostatic properties of platelets in rats with a low amount of antioxidants in their diet.

**Materials and Method**

The study was conducted in strict accordance with the ethical principles established by the European Convention for the Protection of Vertebrate Animals used for experimental and other scientific purposes (adopted in Strasbourg on March 18, 1986 and confirmed in Strasbourg on June 15, 2006).

The study included healthy male Wistar rats (n = 116) that were kept on a standard diet, not rich in antioxidants, under normal vivarium conditions, including 23 rats 3 months of age, 22 rats aged 6 months, 24 rats at the age of 12 months, 22 rats 18 months of age and 25 animals at the age of 24 months. In rats, their general state and parameters of biochemical and hematological blood parameters were determined. Platelets were isolated from their blood during washing and resuspension, with further evaluation of the amount of malonic dialdehyde (MDA) in them during the reduction reaction with thiobarbituric acid and by determining the concentration of acyl hydroperoxides (AHP)\(^4\). The functional activity of platelet antioxidant enzymes, catalase and superoxide dismutase (SOD), was recorded\(^4\). In the blood plates, the amount of adenosine triphosphate (ATP) and adenosine diphosphate (ADP) with the determination of the degree of their secretion under the action of collagen. The composition of the protein cytoskeleton of platelets consists of actin and myosin, determined during activation and during platelet aggregation in response to ADP and thrombin\(^1\). The number of platelets in rats was counted in the Goryaev chamber. Platelet aggregation (AT) activity was determined using a visual micromethod\(^1\) using a number of agonists: ADP (0.5\(\times\)10\(^{-4}\) M), thrombin (0.125 units /ml), collagen (dilution 1: 2 of the main suspension), ristomycin (0.8 mg/ml), \(\text{H}_2\text{O}_2\) (7.3 \(\times\) 10\(^{-3}\) M), adrenaline (5\(\times\)10\(^{-6}\) M). The state of intravascular platelet activity (IPA) was determined using a phase-contrast microscope\(^1\). The results were processed by student’s criterion.

**Research Results and Discussion**

The functional general state of the observed rats, which did not regularly receive antioxidants, was without features. Assessment of biochemical parameters of blood platelets in the course of ontogenesis shows their stability in the period between 3 and 6 months of life. The quantity of AHP in their platelet counts at 3 months was of 2.47\(\pm\)0.19 D\(_{233}\)/10\(^9\) platelets and remained stable up to 6 months (2.49\(\pm\)0.23 D\(_{233}\)/10\(^9\) platelets). It increased in 12 month old animals to 2.90\(\pm\)0.26 D\(_{233}\)/10\(^9\) platelets and further increasing to 24 months to 3.29\(\pm\)0.31 D\(_{233}\)/10\(^9\) platelets. The concentration of MDA in platelets of rats of 3 months on a poor antioxidant diet was 0.73\(\pm\)0.16 nmol/10\(^9\) platelets and remained stable up to 6 months of life (0.74\(\pm\)0.12 nmol/10\(^9\) platelets). It increased further, averaging 12 months of 0.96\(\pm\)0.18 nmol/10\(^9\) platelets and 24 months of 1.16\(\pm\)0.22 nmol/10\(^9\) platelets. The level of activity of catalase and SOD platelets in examined rats was consistently high until 6 months (9762.0\(\pm\)rate of 16.07 IU/10\(^9\) platelets, and 1800.0\(\pm\)18.24 IU/10\(^9\) platelets). In older age it decreased, accounting for 24 months animals 8000.0\(\pm\)16.01 IU/10\(^9\) platelets and 1560.0\(\pm\)6.45 IU/10\(^9\) platelets, respectively.

The found changes in the activity of free radical processes during ontogenesis in rats seriously affected the state of their processes that activate the activation of blood plates. This concerned the content in platelets and the secretion of ADP and ATP from them. During the observation, the constancy of the low to 6 months content of ATP and ADP in rat platelets (5.70 \(\pm\) 0.19 \(\mu\)mol /10\(^9\) platelets and 3.42\(\pm\)0.21 \(\mu\)mol/10\(^9\) platelets) was replaced by their growth by 24 months to 6.18 \(\pm\) 0.28 \(\mu\)mol/10\(^9\) platelets and 4.25\(\pm\)0.20 \(\mu\)mol/10\(^9\) platelets, respectively. The activity of secretion of ATP and ADP from platelets during the action of collagen on them for the time between 6 and 24 months of life grew by 18.5% and 19.7%, respectively (table 1).

The level of actin in the composition of platelets of rats in the age between 3 and 6 months was stable and small, but then increasing, increasing to 2 years to 46.7\(\pm\)0.12% of the total protein in the platelet. The degree of additional generating actin in rats with aggregation of platelets under the action of strong or weak inductor has grown after the age of 6 months. Comparable activity in platelets of rats identified for myosin mechanism. It is found that in the inactive blood platelets in rats in 6 months life level of myosin was 16.0\(\pm\)0.14% of the total protein content in platelet. In older rats, this indicator is found that in the inactive blood platelets in rats after 6 months of life increased the intensity of processes of Assembly of myosin (table 1).

In rats after 6 months, the development of a reduction in the period of occurrence of antibodies in relation to all
inductors used (table 1). First of all, AT came in response to collagen, developing in 24 month-old rats after 28.1 ± 0.10 s. Similar AT dynamics in response to ADP and ristomycin were found in rats. A little later, AT appeared in response to H$_2$O$_2$, thrombin, and adrenaline. AT time with them was significantly reduced after 6 months of life.

The performed assessment of antibodies with individual inductors made it possible to establish in rats older than 6 months the enhancement of the ability of blood platelets to antibodies. The reduction in the time of observation of antibodies with strong agonists (collagen and thrombin) indicated the activation of phospholipase C in them, which realizes the phosphoinositol pathway of platelet involvement in hemostasis. This indicated an increase in the number of diacylglycerol and protein kinase C, which strengthen the assembly of actin and myosin molecules. A decrease in the AT period in response to a weak inducer (ADP) indicated an increase in the availability of receptors for this inducer with an increase in the density of fibrinogen receptors on the platelet surface and an increase in the activity of phospholipase A$_2$, which releases arachidonic acid from membranes to generate thromboxane A$_2$.

The age-related changes in the level of platelet activity found in the course of an in vitro assessment were confirmed by the IPA assessment. Thus, the number of platelet-blood cells in rats is up to 6 months it was stable and equaled at this age 79.9±0.18%. Subsequently, this value decreased by 24 months to 68.5±0.22%. The total number of active platelet forms after the age of 6 months gradually increased during the observation period by 61.7%. During the first half of the year, the number of free small and large platelet aggregates in the blood of animals was stable and low. Subsequently, their number increased from 3.2 ±0.08 and 0.13±0.003 per 100 free platelets at 6 months of age to 6.1±0.08 and 0.47±0.004 per 100 free platelets at 24 months. The number of platelet aggregates in rats during the considered observation period increased by 36.2%. The found increase in IPA parameters in rats indicated an increase in their expression of fibrinogen receptors on their surface, confirming the increased sensitivity of platelets to physiological inducers of aggregation (ADP, thrombin, adrenaline) against the background of the activation of intra-platelet hemostasis mechanisms.

Note: * - p <0.05, ** - p <0.01. Reliability of the dynamics of the indicators taken into account compared with the outcome. In the following table, the notation is similar.

**Conclusion**

In rats during life, who are on a diet that is not rich in antioxidants, between 6 and 24 months of age, a significant increase in platelet readiness for the aggregation process develops. This leads to a very pronounced increase in their blood of the total volume of activated platelet species and their aggregates of any size freely circulating through the vessels.

Socioeconomic Disparities and Depression among Cambodian Migrant Workers in Thailand

Pall Chamroen1, Wongsa Laohasiriwong2, Amornrat Luenam3, Poonsri Rangseekajee4

1Doctor of Public Health Program, Faculty of Public Health, KhonKaen University, Khon Kaen, 2Faculty of Public Health, KhonKaen University, Khon Kaen, 3Faculty of Public and Environmental Health, Huachiew Chalermprakiet University, Samut Prakan, 4Department of Psychiatry, Faculty of Medicine, Khon Kaen University, Khon Kaen, Thailand

Abstract

Migrant workers poor working and living conditions have put them vulnerable to both physical and mental problems. However, little is known about the influence of socioeconomic conditions on depression of Cambodian migrant workers in Thailand.

This study aimed to determine the prevalence of depression and the influence of socioeconomic factors on depression among Cambodian migrant workers in Thailand.

A cross-sectional of 1,211 samples were selected by using a multi-stage random sampling from 2 provinces along Thai-Cambodia border to respond to a structured questionnaire interview. The multilevel logistic regression was used to determine the association between socioeconomic factors and depression when controlling other covariates, presenting adjusted oddsratio (AOR), 95% CI and p-value.

Most of the Cambodian migrant workers had moderate to severe levels of depression (69.69%, 95%CI: 67.10 to 72.29). The socioeconomic factors that were associated with depression were: lived alone (AOR= 3.42; 95%CI: 2.01 to 5.82, p-value <0.001), a construction worker (AOR=2.11; 95%CI: 1.47 to 3.02, p-value <0.001), stayed in employer’s accommodation (AOR=1.85; 95%CI: 1.31 to 2.62, p-value <0.001), had no formal education or finished primary education (AOR=1.63; 95%CI: 1.18 to 2.25, p-value = 0.003) had monthly income ≥6000 Baht (AOR=1.57; 95%CI: 1.037 to 2.37, p-value = 0.033).

More than two-thirds of Cambodian migrant workers in Thailand had depression. The working and living conditions hardships and their adaptation abilities had influenced on the depression.

Keywords: Adaptation, Cambodian migrant workers, Depression, Socioeconomic disparities.

Introduction

Depression is one of the most common mental health problems as well as a major disease burden worldwide(1). The American Psychiatric Association indicated that depression symptoms can vary from mild to severe(2). The symptoms include: feeling sad or having a depressed mood, loss of interest or pleasure in activities once enjoyed, changes in appetite resulted in weight loss or gain unrelated to dieting, loss of energy or increased fatigue and trouble sleeping or sleeping too much(1,2). The severe symptoms are feeling worthless or guilty, difficulty thinking, concentrating or making decisions and thoughts of death or suicide. These symptoms must last at least two weeks for a diagnosis of depression(2).

Epidemiological research indicated the association between socioeconomic status (SES) and health that “the lower people’s SES, the poorer their health and the greater their risk of chronic disease and premature death”(3). This socioeconomic risk factors does not influence only physical conditions and mortality, but also to mental health problems especially anxiety and mood.
disorders. Mood disorder such as depression are more prevalent in those with lower SES(4). A “migrant worker” is a person who migrates from one country to another for employment (UN)(5). Thailand booming of development especially constructions and food processing industries has created demands for low-skilled worker and low-pay laborers. Gaps of development and economic growth between Thailand and its neighboring countries have attracted trans-border migrants to meet the demand(6). Cambodians migrant workers are the second largest group in Thailand, after the Burmese. Almost all Cambodian migrant workers get into Thailand through land borders. Thai and Cambodian people near the border shared similar language, therefore many rural villagers with low-socioeconomic status could migrate to work in all sectors in provinces near the border. Most of the migrant workers are typically employed in the ‘3D jobs’–dirty, dangerous and demeaning(7). Cambodian migrant workers in Thailand are mostly low skills and work under poor working conditions, therefore many of them are vulnerable to mental health problems such as depression or anxiety since these psychological problems is related to poverty, debt or lack of access to basic needs(8).

Migrant workers have to live outside their home countries, they are more likely to have difficulty in adaptation to the environment resulted in stress and feeling loneliness. In addition, lack of social support and struggling in financial constraint also worsen their mental health status(9). A nationwide survey on mental health among Cambodian population indicated that 16.6% of the population had acute depression(10), of which the problems among migrant workers might more severe. Therefore, this study aimed to determine the prevalence of depression and the influence of socioeconomic factors on depression of Cambodian migrant workers in Thailand.

Material and Method

Study Design and Sampling: This cross-sectional survey was conducted in 2 provinces along Thai-Cambodia border, Sakaeo and Surin provinces. The sample size was calculated following formula(11)

\[ np = \frac{n_1}{1 - \rho^2_{1,2,3,\ldots,p}} \]

The approximate sample size was 435 which were further adjusted to control the over-fitting using the rho (\(\rho\)) of 0.65 and variance inflation factor (VIF) equal to 2.85. Therefore, the total number of the sample was 1,211.

A multistage random sampling method was used to select participants in 8 districts of 2 provinces along Thai-Cambodia border. There were 24,256 Cambodian migrant workers registered with the Department of Employment Office. Finally, all participants who met the inclusion criteria were randomly selected proportionally to size of the samples added to the total of 1,211 samples. Data were collected between March 2018 and May 2018.

Questionnaires: A structured questionnaire was developed from reviewed literatures based on research questions, first in English version and translated into Khmer using forward and backward translation procedures. The questionnaire consisted of 4 sections which were a) Demographic and socioeconomic, b) The Perceived of Stress Scale (PSS) of Cohen et al.,(1983), c) WHOQOL-BREF Khmer version, and d) Depression Scale (CES-D) of Radloff et al. (1977). The questionnaire was underwent content validation by 5 experts and was revised to improve validity.

Data Analysis: STATA® (version.13; College Station, TX, USA: Stata Corp) was used to analyze the data. Demographic characteristics of the participants were described as frequency and percentage for categorical data; mean and standard deviation for continuous data. Inferential statistics, a simple logistic regression was used for bivariate analysis to identify individual risk factors associated with depression. The factors that had p-value <0.25 were processed into the multivariable analysis using multilevel logistic regression and reported the adjusted odds ratio (AOR) and their 95% confidence interval (95% CI) and p-value<0.05 was considered as statistically significant.

Result

Demographic Characteristics: About half of the samples were male 50.37% with mean age of 32.54 ± 11.14 years old, 62.59% were married, and 68.13% had children. As high as 42.69% had no formal education, 55.57% worked in agricultural sectors and 66.47% were outdoor workers. More than half of them stayed with family or relative, and lived in a house provided by their employer. Their average monthly income was 7,487.98 ± 2075.10 THB. More than half 61.44% had work-related diseases during the past 12 months and 28.57% were the smoker. Regarding perceived stress: 10.24% of the migrant workers had high level of stress whereas 57.72% had moderate levels of stress. As high as 34.52% of the migrants workers had a low level of QOL.
Factors associated with depression: Bivariate analysis: Bivariate analysis on the association between each independent variable and depression symptom was performed presenting the crude odds ratio (OR) with 95% CI, and p-value. All factors that had p-value <0.25 were proceeded to multivariable analysis by using multilevel logistic regression (Table 1)

Table 1: Factors associated with Depression (CES-D) of Cambodian migrant workers: Bivariate analysis

Discussion

Previous study indicated that socioeconomic status had high impact on depression and other mental symptoms\textsuperscript{(12)}. The multivariable analysis of this study also confirmed that SES, the socioeconomic disparities, was associated with depression of Cambodian migrant workers in Thailand. The migrant workers who had only primary education or no formal education were 1.63 times more likely to depress more than those with higher levels\textsuperscript{(13)}. Those with lower level of education are usually have a lower position with less salary. The respondents who were construction workers were 2.11 times more likely to depress than others. It might be related to work conditions such occupational injuries and frequently exposed to various risks from poor working environments with long hours and male workers were more likely to face with depressed\textsuperscript{(14)}. Participants who had greater personal monthly income ≥6000THB were more depressed than those with lower income\textsuperscript{(15)}. It might be that a higher income was followed by higher responsibility on their work. In addition, they might have fewer times to rest with family.

Participants who stayed alone were 3.42 times more likely to depress than those who stayed together with family, relatives, and friends. Staying alone might lack interaction and advising from family or friend. Therefore when they faced with problems they have to take responsibility alone\textsuperscript{(16)}. Respondents who stayed in a house provided by the employer were 1.85 times more depressed than those who were in a rent house. Even though the house was provided for free by the employer but its location might too far from the community
center and temporary shelter especially for agriculture and construction workers. Moreover, it also limited their accessibility to services for their basic needs in everyday living especially poorly access to health services could contribute to high prevalence of depressed (17).

Participants who reported having high level of PSS were three times more likely to depress than those with low to moderate levels of PSS with also similar with a previous study (18). Many reasons that could explain; hardship in working conditions, work relating illness, living environment, language barrier, a might cause them more stressful to develop depression (19). Participants who has a low level of QOL were two times more likely to depress when compared with those who has moderate to high levels of QOL. It might be resulted from lack of social integration when they lived in new environments for long period of times that make them feel missing home, deprivation and could result in depressed (20).

**Conclusion**

The current study reported almost 70% of Cambodian migrant workers in Thailand had depression. Socioeconomic factors, stress, and quality of life had high impact on depression of these migrant workers. Relevant sectors such as employers, local administration, and health sectors should collaborate work to improve the migrant workers’ working and living condition. Counseling is also essential to help improving their ability to coping with stress and other socioeconomic and environmental factors.

The Effects of an Integration of PRECEDE-PROCEED Model and Health Literacy in Behavioral Modification for Weight Control among Overweight and Obesity of Adolescents in the Northeast of Thailand

Pornthip Kaewchin1, Pannee Banchonhattakit2, Pall Chamroen3

1Student of Doctoral Program of Public Health, 2Department of Public Health Administration Health Promotion Nutrition, 3Faculty of Public Health, Khon Kaen University, Khon Kaen, Thailand

Abstract

This study was aimed to investigate the effects of the Integration of PRECEDE-PROCEED Model and Health Literacy in behavioral modification for weight control among overweight and obesity of adolescents in the Northeast of Thailand. This study was an experimental intervention. The sample size included 80 Mattayom 2 students in 2 lower-secondary school. It was two group clusters randomized controlled trial that were divided into 2 groups of intervention (40) and the control (40) in lower-secondary school in Nakhon Ratchasima province.

The results were concluded that the experimental group had better health behavior including physical activities (Mean difference = 9.47, 95% CI = 7.38 to 11.55, P-value < 0.001), consumption behaviors (Mean difference = 9.45, 95% CI = 6.75 to 12.15, P-value < 0.001) and behaviors of coping with emotion (Mean difference = 8.48, 95% CI = 6.16 to10.79, P-value < 0.001) more than the control group with statistical significance at the level of 0.05

This means that the integration of the PRECEDE-PROCEED Model with health literacy can increase in the average score of health behaviors higher than before the experiment. The clinical result of obesity which decreased means that study can be used as a model for controlling and preventing overweight and obesity of adolescents and in other areas.

Keywords: Overweight, Obesity, Health Education, Weight Control.

Introduction

Obesity is chronic disease which ruins one’s health both in physical and mental, including any risk factors to have other diseases (1). The estimation for the global prevalence of overweight and obesity in 2016, over 340 million children and adolescents aged between 5 to 19 years were overweight. This prevalence has risen dramatically from 4% in 1975 to over 18% in 2016 in both boys (19%) and girls (18%) (2). In Thailand in 2017 children aged 6-14 years old showed that they seemed to gain weight and overweight at 10.61% in 2014, 11.73% in 2015, 12.89% in 2016 and 12.77% in 2017 (3).

Nowadays the adolescents and youths in Thailand, quite concentrates on external appearance and be unsatisfied with their own shapes. It effects to their diet disorder behavior such as using diet pills and do fasting; which extremely impacts to their health (4). The last demonstration has increased rates of obesity in children and adolescents which indicated that an urgent administration to correct the action among them would be essentially needed by using the PRECEDE-PROCEED Model and health literacy to key mine weight situation.
The PRECEDE–PROCEED model is a cost–benefit evaluation framework proposed in 1974 by Lawrence W. Green that can help health program planners, policy makers and other evaluators analyze situations and design health programs efficiently. Health literacy is the personal, cognitive and social skills which determine the ability of individuals to access, understand and use information to promote and maintain good health. The research found that the obesity in school-aged children was associated with parental factors. The obesity in adolescents were strongly associated with health knowledge of the adolescents. Consequently, the researcher pays attention on this issue in order to study the behavioral modification for weight control among overweight and obesity of adolescents. The intervention was developed to modify from PRECEDE-PROCEED Model and health literacy.

**Material and Method**

**Study Design and Sampling:** This study was an experimental interventional. Data were collected from May 2018 to October 2018. The sample size was calculated following formula of Hemming et al.

\[
n = 2 \alpha^2 \left[ \frac{Z_{a/2}^2 + Z_{p}^2 \times VIF}{(\mu - \mu_0)^2} \right]
\]

The approximate sample size was 34 and preventing missing data or loss of 5% sample size can be adjusted by using formula of Lachin. Therefore, the total number of the sample was 40. This study has two group clusters randomized controlled trial. The sampling was selected from 2 schools. The researcher was interested in students in Lower Secondary Mathayom 2 due to the fact that the result in phase 1 found out the highest prevalence of obesity. That was divided into 2 groups of intervention (40) and the control (40) students, so the total was 80 students in lower-secondary school in Nakhon Ratchasima provinces. The process of random allocation to the intervention and control groups of the participants in these two groups. Inclusion criteria were among overweight and obese students in junior high schools in Nakhon Ratchasima province, (BMI for age 85th to < 95th Percentile and ≥ 95th Percentile), students who have permission from their parents and voluntarily participate in the study. Besides, they have not ever joined any health improvement behaviors before and everyone has their personal mobile phone. Exclusion criteria were students has BMI ≥40 as morbidly obese and students with Chronic Illnesses which obstruct to the research and use a dietary supplement for weight loss. Data collection was performed in 3 periods. Baseline measures and 3 and 6 months after measures after receiving the intervention and additional analyses body weight, body mass index, waist circumference, and waist to hip ratio, body fat and triceps skinfold.

**Intervention:** The experimental group would receive an intervention according to our plan and fixed period which each time was not over than 45 minutes. Week 1-12, those in the control group are free of intervention. The experimental group receiving the intervention they were determined to join 6 activities as following,

**Week1,** 1st activity, develop the cognitive skills including predisposing factors to obesity in Adolescence. The purpose of the activity was to build up group dynamics in order to make friendliness relationship to each other; moreover, the activity in group brought them, to get better knowledge, improving attitude of obesity.

**Week2,** 2nd activity, develop the access skill and media literacy skill by creating group in Facebook, Line, using application “FoodiEat” diet manual so that they can share and exchange the health literacy skill to each other, including encouraging their behavior as well.

**Week3,** 3rd activity, develop the Self-management skill including enabling factors to obesity, first of all, they had to set target how to do on diet, preventing gain weight and keep control their weight not to be over, next, recording on their personal notebook what food they ate, their workout and any change of their weight and the last one was to practice how to select healthy food in order to lose weight.

**Week3-10,** the activity was to work out as aerobic dance 3 days week, in 30 minutes each time in the afternoon after class.

**Week4,** 4th activity, develop the communication skill including reinforcing factors to obesity, the method was to have role models to weight loss journey has been motivation to motivate them or earn any reward if they could be done with it successfully.

**Week5,** 5th activity, develop the decision skill, they had to know how to handle with stress and control their hunger, and moreover, they learned both good things
and bad things once they were on diet and what they should deny to do while they were on experiment period.

Week 6-12, to stimulate them on diet correctly continually, group members could urge their team via social network like Line and Facebook at least once a week.

Week12, 6th activity, the school proposed the policy and rules in order to support this activity which is able to improve adolescents’ diet behaviors sustainably. After experimental evaluation in week13.

**Questionnaires:** The questionnaire was modified from reviewed literatures based on research questions. The questionnaire contained 4 parts: 1) Demographic Characteristics, 2) evaluate of overweight and obesity, 3) health literacy in order to prevent obesity disease, and 4) behaviors which effect to obesity disease. The validity of the questionnaire was confirmed during piloting.

**Data Analysis:** Stata version 10.0 (StataCorp, College Station, TX) was used for data analyses by using multiple linear regression statistics. The results were repeatedly measured over time analyzed with Generalized Estimating Equations (GEE) statistics reported Mean difference and a 95% confidence interval (95%CI) and considered significant at P < 0.05.

**Result**

The results found that after receiving Intervention, the experimental group has better health literacy to prevent the obesity including cognitive skill (Mean difference = 1.51, 95% CI = 1.11 to 1.19, P-value <0.001), access skill (Mean difference = 3.17, 95% CI = 1.92 to 4.43, P-value <0.001), communication skill (Mean difference = 3.80, 95% CI = 2.46 to 5.14, P-value <0.001), self-management skill (Mean difference = 1.83, 95% CI = 1.15 to 2.51, P-value <0.001), media literacy skill (Mean difference = 3.91, 95% CI = 2.77 to 5.04, P-value <0.001), decision skill (Mean difference = 2.16, 95% CI = 1.39 to 2.93, P-value <0.001) more than the control group with statistical significance at the level of 0.05 (Table 1).

Discussion

The results found that three and six months after the intervention the experimental group has the health literacy to prevent the obesity include cognitive skill, access skill, communication skill, self-management skill, media literacy skill and decision skill, and has the health behavior including physical activities, consumption behaviors and behaviors of coping with emotion more than the control group with statistical significance at the level of 0.05. This result is consistent with the study of Rezapour et al. (2016) study School-Based and PRECEDE-PROCEED-Model Intervention to Promote Physical Activity in the High School Students. The results, the school-based intervention, and components of PRECEDE-PROCEED Model had a positive impact on the improvement of physical activity and a decrease in physical inactivity among the students (11), and conforms to the study of Chari et al. (2014). The results showed up that health literacy is associated with obesity in teenagers. It quite affects the strategies of prevention and remedial treatment to the obesity disease (7). Therefore, the integration of PRECEDE-PROCESS Model with health literacy might improve the adolescents’ diet behaviors that were overweight and obesity in the region of north eastern of Thailand as the experiment had reflected the increasing of average scores in health literacy higher.

The experimental period had evident changed that occurred to the overweight and obesity of the adolescents of both experimental and controlled groups. After receiving Intervention, the experimental group has the body weight, body mass index, waist circumference, waist to hip ratio, body fat and triceps skinfold lower than the control group. This result is similar to Trifoni-Melo A et al. (2014) The results showed was significant reduction of all variables in the intervention group (p<0.01). Patients of the intervention group presented greater weight loss (4.4kg, p<0.01) and reduction of body...
mass index, waist circumference, waist circumference 1, waist circumference 2 (p<0.01), and fat mass (p=0.04) than the control group\(^{(11)}\).

**Conclusion**

From this study showed the reflection of the increase in the average scores of health literacy and health behavior higher. So if we wanted to improve their behaviors, should bring the integration of PRECEDE-PROCESS Model with health literacy by using to the Behavioral Modification for Weight Control among Overweight and Obesity of adolescents including another age period as well.

Identification and Job Hazard Analysis in Playing Facilities at Klojen Kindergarten, Indonesia

Qomariyatus Sholihah¹, Endra Yuafandi Ariňanto¹, Dewi Hardiningtyas¹, Amanda Nur Cahyawati¹, Rahmi Yuniarti¹, Nasir Widha Setyanto¹

¹Departement of Industrial Engineering, Faculty of Engineering, University of Brawijaya, M.T. Haryono Street 167, Malang, East Java, Indonesia

Abstract

Learning activities in Kindergarten are conducted by learning while playing. Kindergarten of Klojen is one of the Kindergarten that provides playing facilities that are very diverse for their students. The types of games in Kindergarten include 1-seat swing, (playground) / slide board, climbing iron, half-circle climbing game. All of these playing facilities still have potential hazards for children. The purpose of this study was to analyze the potential hazards at playing facilities in Kindergarten and find the cause, and propose improvements to safer children’s playing facilities. This observational descriptive study aims to determine the level of safety risk in playing activities related to the use of game equipment in outdoor playing areas. This study identifies hazards and risks at each stage of play activity using the Job Hazard Analysis method and analyzes the value of probability, exposure, and consequences at each of these stages. The results of this study state that the level of risk at each stage of playing activities in the outdoor play area includes very high levels, priority 1, substantial, priority 3, and acceptable. The proposed improvements made on the 1-seat swing include adding backrests and armrests, the height of the seat board adjusted to the children, the shade roof. Sliding boards include repairing stairs, adding sandboxes, raising the side of the sled.

Keywords: Kindergarten, job hazard analysis, playing facilities, danger.

Introduction

Safety is an important aspect in the implementation of industrial processes and in daily activities. The safety of industrial processes in its activities has been regulated by their respective companies with the establishment of a special division of occupational safety and health which is commonly known as the division of health safety and environment (HSE) ¹. While the implementation of safety aspects in various activities carried out by individuals and the public every day (outside the industrial process) escapes the government’s attention ².

One of the most frequent and crowded places to visit is a playground. Playground is a playground for children, a place to develop creativity, as well as a place to socialize for them but in the playground there is a risk of danger due to falling from a height that can result in injury or maybe to experience a more fatal injury ³,⁴.

Based on research conducted by Tinsworth and McDonald related to cases of injury / injury to children, it is known that every year in the United States there are more than 200,000 children under the age of 15 years treated in the emergency part of the hospital due to injury / injury related to play equipment in the playing area. Cases of injury / injury experienced are in the form of falling from a height while playing. The results of the study found that 76% of injury / injury incidents related to play equipment occurred in the general playground with a proportion of 45% occurring in the school play area and 31% occurred in public playgrounds, such as fast food restaurants, a childcare playground, and an apartment play area ⁵.

In Indonesia, child mortality due to land accidents was recorded at 7.3% in 1992 and is one of the five highest causes of child mortality. From the Basic Health Research data in 2007, cases of land accidents in children, one of which was caused by a fall from a height in the play area, which was a percentage of 19.2% ⁶.

Kindergarten is one of the forms of early childhood education units ⁷. All learning activities in Kindergarten are packed in the form of learning while playing so that Kindergarten is generally equipped with a playground with various types of playgrounds ⁸.
In the initial observations made by the author, it was found that there were a number of rotten play tools, did not have their own safe zones, and the distance between the game equipment was not standard (due to the limited play area). In addition, in the Kindergarten of Klojen there have been cases of injury to students who use playground equipment in outdoor play areas. Cases of injury that have occurred are in 2016 with 4 cases. The case was in the form of bumping the head of the student while playing a swing impacting the bruise on the head, the fall of the student from the swing impacting the blisters, and the bumping of the student’s nose when playing the swing had an impact on the nose.

Based on these findings, a risk management effort is needed which begins with identifying safety hazards and risks in playing activities related to the use of game equipment in the outdoor play area of Kindergarten of Klojen, Malang.

Method

The design of this study is descriptive observational by using a semi-quantitative approach to determine or estimate the level of safety risk in playing activities in the playing area of Kindergarten of Klojen, Malang. Identification of hazards and risks is carried out using the JHA method. After that, risk analysis is performed using semi-quantitative method based on AS / NZS 4360: 2004 standard on Risk Management by determining the value of probability, exposure, and consequences, these values are then calculated to get the level of risk (level of risk) at each Play activities carried out by Kindergarten of Klojen students, Malang.

The results of the study in the form of identification of hazards and safety risks and the results of the analysis of the level of risk of safety and the discussion described in the form of narrative. The instruments used were interview sheets, JHA sheets, cameras, tables of probability, exposure, consequences, and the level of risk (level of risk) of W.T. Fine J., and a risk calculation formula from software (Microsoft Excel).

Results and Discussion

Risk of Playing Facilities Based on Risk Analysis AS / NZS 4360: 2004

Slides: The level of risk in slides is based on the results of risk analysis 9, generally have a Priority 3 risk level both in Basic Risk Level, Existing Risk Level, and Predictive Risk Level. This is caused by most of the hazards and safety risks that occur in this game tool, which is likely to be quite frequent, but it causes the impact of minor abrasions and causes loss of learning time which is estimated to be less than 1 hour (noticeable) to cause injury serious enough that it needs to be addressed by providing first aid medicines at school and causing loss of study time which is estimated to be one hour to one day (important).

The size of the slide is suitable for Kindergarten age, namely the length of the slide board from the beginning to the exit of the slide board of (100-150 cm) and the distance between the slide stairs is 25 cm.

In the slide game equipment in the Kindergarten of Klojen, the size of the slide height was 114 cm, the length of the slide board from the beginning to the exit section of the skateboard was 150 cm, and the distance between stairs was 25 cm. In addition, the average size of students as game users is an average height of 104 cm. The average student’s body weight is 18 kg. From the comparison between the size of the Safety Playground standard 10, the size of the slide, and the average height and weight size of the Kindergarten of Klojen students found that this slide play device was not dangerous for students because the game device was not too high and the sled was sloping.

From the results of the risk level analysis and comparison between the size of the Safety Playground standard 10, the size of the slide, and the average size of the height and weight of the student as a user of the game device (user) can be concluded that the slide play equipment in the Kindergarten of Klojen is suitable for the age of students.

Arch Climber: The level of risk in the semicircular climbing game equipment (arch climber) is based on the results of risk analysis 9 has a Priority 1 risk level in the Basic Risk Level and has a Priority 3 risk level on the Existing Risk Level and Predictive Risk Level. This is caused by most of the hazards and safety risks that occur in this game tool, which is likely to be quite frequent and cause an impact in the form of injuries that are quite serious so that it needs to be dealt with by providing first aid medicines at school and causing loss of learning time, estimated one hour to one day. However, after risk control is already in place at school and given risk control recommendations by the author, the level of risk can drop to priority 3, which means that it needs to be
maintained in control that is already in school and given continuous supervision.

The size of the semicircular climbing (arch climber) which is in accordance with the Kindergarten age, i.e., the height of climbing is 135 cm), the distance between the arch climber stairs (vertical rises) is 22 cm and the diameter of the stairs is 2.2-3.1 cm. In the semicircular climbing game (arch climber) in Kindergarten of Klojen it was found that its height was 134 cm, the distance between arch climber stairs (vertical rises) was 26.5 cm, and the staircase diameter was 5.15 cm. In addition, the average size of students as game users is an average height of 104 cm. The average student’s body weight is 18 kg. From the comparison between the size of the Safety Playground standard, Semicircular climbing size, and the average height and weight size of Klojen Kindergarten students found that this semicircular climbing game is not dangerous for students because the playground is not too high (still below the standard) and students are still easy to move and hold on each step.

From the results of the risk level analysis and comparison between the size of the Safety Playground standard, the size of the semicircular climbing (arch climber), and the average size of the height and weight of students as users of the game (user) can be concluded that the semicircular climbing game in the Kindergarten of Klojen was suitable for the age of Kindergarten students.

**Single Swings:** The level of risk in the single swings game is based on the results of risk analysis has a Very High risk level in the Basic Risk Level and has a Priority 3 risk level on the Existing Risk Level and Predictive Risk Level. This is caused by most of the hazards and safety risks that occur in this game tool that is likely to be frequent and cause serious injury such as a tear on the head due to a fall from a swing, broken teeth due to the impact of the swing holder, and bruises on the nose due to hit the swing seat so that it requires medical treatment by a doctor, and causes loss of study time estimated to be 2-3 days or more (serious). After controlling for risks that already exist in schools and given risk control recommendations by the author, the level of risk can go down to priority 3, which means that it needs to be maintained in control that was already in school and given continuous supervision.

Single swings are suitable for Kindergarten age, which is a measure of the distance between the swing holder and the surface of the playing area of at least 12 inches (maximum 30.48 cm) and fall height, which is a maximum of 60 inches (maximum 152.4 cm). There are two single swings that are the same size. In single swings, it was found that the height was 158 cm, the height of the fall (fall height) was 78 cm, and the distance between the swing seat and the surface of the playing area was 22 cm. In addition, the average student as a user of the game is the average height of 104 cm. The average student’s body weight is 18 kg. From the comparison between the size of the Safety Playground standard, Single swings, and the average height and weight size of Kindergarten of Klojen students found that single swings are not dangerous for students because of the size of the fall height and the distance between the swings to the surface of the play area. Both small and large swings are below the standard size and can still be reached by students.

From the results of the risk level analysis and comparison between the size of the Safety Playground standard, single swings, and the average size of height and weight of students as users of the game (user) can be concluded that single swings in the Kindergarten of Klojen are suitable for Kindergarten students.

**Vertical Climber:** The level of risk in the vertical climber is based on the results of risk analysis has a Priority 1 risk level in the Basic Risk Level and has a Priority 3 risk level on the Existing Risk Level and Predictive Risk Level. This is caused by most of the hazards and safety risks that occur in this game tool that is likely to be quite frequent and cause the impact of serious injuries such as bruises, lumps that need to be treated with first aid medication at school and cause time loss study which is estimated to be one hour to one day. However, after risk control is already in place at school and given risk control recommendations by the author, the level of risk can drop to priority 3, which means that it needs to be maintained in control that is already in school and given continuous supervision.

Vertical climbers size that corresponds to Kindergarten age, which is the height of climbing by 142.5 cm), the distance between stairs vertical climber (vertical rises) is 23 cm and the diameter of the stairs is 2.2-3.1 cm. In vertical climbing equipment in Klojen Kindergarten, the height is 218 cm, vertical climber (vertical rises) is 25 cm, and the ladder diameter is 5.15 cm. In addition, the average size of students as game users is an average height of 104 cm. The average student’s body weight
is 18 kg. From the comparison between standard Safety Playground size, vertical climbing size, and average height and weight size of Klojen Kindergarten students found that this vertical climbing game is quite dangerous for students because the game equipment has a high size that exceeds the standard.

From the results of the risk level analysis and a comparison between the size of the Safety Playground standard, vertical climber size, and the average height and weight of students as users of the game (user) can be concluded that the vertical climbing game in the Kindergarten of Klojen is not suitable for Kindergarten age.

**Conclusion**

Risks caused by playing activities are 7 types of risks, namely the risk of being hit, falling, slipping, scratched, dislocated, rubbed, and pinched. The control efforts that have been made by the Kindergarten of Klojen are providing rubber mats on the bottom of the slide board and under the single swing, supervision by the class teacher when students are playing, division of play schedules, rules notification or the right way to play to students (at the beginning of entering the new school year and sometimes before the playing activity begins), make a story from the experience of the incident the friend who was injured because of falling so that the other friends know the danger and the consequences, and available School Health Unit facilities and drugs First aid medicines at school (betadine, eucalyptus oil / wasp oil, etc). Based on Safety Playground standards, slides play equipment, arch climber, vertical climber, single swing were suitable for Kindergarten students, but improvements were still needed.

**Ethical Clearance:** Not required.

**Funding:** This study was supported by a 2018 Grant from Research and Community Development Center of University of Brawijaya.

**Conflict of Interest:** There is no conflict of interest exist.

The Prevalence of H. Pylori Infection in Patients with Non-Ulcerative Dyspepsia

Raad Hassan Najim¹, Summer Saad Abdulhussein²

¹FIBMS Pathology, Clinical Immunology, M. Sc. Interventional Cardiology, Kirkuk Medical College,
²FIBMS General Medicine, FIBMS Gastroenterology, Kirkuk Medical College

Abstract

Background: Dyspepsia is considered as an important public health to involve a variety of upper gastrointestinal non-specific symptoms showing no any organ involvement about 60-70% of patients attending GIT clinic suffered from dyspepsia. The aim of our study to estimate the association of infection with H.pylori bacteria with No-ulcerative dyspepsia diagnosed by upper GIT endoscopy and rapid urease test

Material and method: 455 patients having dyspepsia, attending GIT clinic in Azadi teaching hospital over a period extending April 2008 to April 2107, were examined clinically and history were taken, then endoscopy to upper GIt done under local anesthesia, antral biopsy took and investigated for evidence of H.pylori bacteria by urease test doing rapidly.

Results: 455 patients having non ulcerative dyspepsia proved by endoscopy enrolled in this study, 260 (57.14%) having Pylori infection by urease test, with no significant correlation from those 260 patients 143 (55%) of them showing improvement after receiving eradication therapy for H.pylori infection

Conclusions: current study, it was founded that there is no e correlation between Helicobacter pylori and NUD, giving broad spectrum treatment for patients NUD and H.pylori infection showing no significant effect in relieving dyspeptic symptoms.

Keywords: H. Pylori, Dyspepsia, anesthesia.

Introduction

There is a certain fact that one of the most important etiologies for peptic ulcer disease is the Helicobacter pylori infection which is founded in 80-95% from cases diagnosed as having peptic ulcer disease. Healing of ulcers depends mainly on treating that infection[¹].

Eradication therapy for H. pylori infection causes absolute cure for peptic ulcer disease. While relapse of the disease is expected in 60-80% of patients treated with anti-secretory drugs.

Although an acute dyspeptic symptom which is self-limited commonly occurs after ingestion of H. pylori, the role of H. pylori infection in symptomatic Non ulcerative dyspepsia remain not obvious.

The Incidence of non-ulcerative dyspepsia resulted from gastritis related with H. pylori infection ranging from (39-87)%[²,³]. Inspite of that controversy remains to be present about if H. pylori infection causes chronic dyspeptic symptoms or not[⁴-⁶]. Improvement of dyspeptic symptoms after a course of eradication therapy for H. pylori infection strengthen the idea of a clear relationship between Non-ulcerative dyspepsia and infection with H. pylori bacteria .three papers reported that there is a strong relation between get rid of H. pylori infection and disappearance of dyspeptic signs[⁷-⁹].

An article published by Patchett et al[¹⁰] stated that there is no relationship between Non-ulcerative dyspeptic symptoms and antral infection with H.pylori bacteria in the short term. A prospective study done for assessment of effect of three different types of drugregimens on patients having both NUD and H.pylori infection lasted for a four-week (colloidal bismuth sub citrate alone; metronidazole with amoxycillin; bismuth sub citrate, metronidazole and amoxycillin) showed that there is different effect of giving these drug or not on two different groups of patient one group received treatment
and another one not received. The final result showed that there is similar improvement of symptoms in those patients taking drugs and another group including patients not receiving any treatment, suggested that the improvement of symptoms not depend on eradication of H. pylori infection. Inspite of that the role of prolonged treatment is not evaluated. This fact initiates us to follow those patients for a long period of time of treatment and to see if there is any change or effect at level of relieving symptoms after complete eradication of infection\[10\].

Aim of the study is to estimate the prevalence of h. pylori infection in patients with Non-ulcerative dyspepsia.

Patients and Method

455 patients were enrolled in this prospective study, 355 were males and 100 were females those patients attend Gastroenterology Clinic in Azadi teaching hospital, over a period expanding from April 2008 to April 2017, all patients taken presented with dyspepsia. Informed consent and agreement of medical ethics committee was taken for this study, endoscopy was done for all those patients and diagnosed as Non ulcer dyspepsia, antral biopsies taken, rapid Urease test was done to diagnose the presence of H. pylori infection. After that patients with non-ulcerative dyspepsia and positive urease test for H. pylori bacteria treated with eradication therapy (omeprazol and metronidazole plus amoxicillin) for 4 weeks duration and then assessment of absence or presence of dyspepsia recorded.

Statistical Analysis: The chi square test was used to assess the effect of the presence of evidence of H. pylori infection by antral biopsy taken by endoscopy. Student T test were used to analyze the effect of H. pylori infection on the Non ulcerative. Significant value for all analyses represented by P < 0.05. Values are measured as mean ± SD.

Results

This prospective study included 455 patients, 355 (78.02%) were male their mean age±SD was (45.3 ±1.23) years and 100 (21.9%) female patients with mean age ±SD of (56.4 ±1.89) Which is older than male patients enrolled in this study. Table 1 shows that Male patients suffered from dyspeptic symptoms for a duration of about (6±1.1) months which is longer duration of symptoms for those female patients enrolled in this study which is about (3±1.5) months, 60.2% about 214 male patients were smokers while only 11% (11 patients) from females were smokers.

Antral biopsy taken through OGD and rapid urease test was done for all patients shows that 260 (57.14%) of patients were positive for the presence of H. pylori bacterial infection in comparison to 195 (42.86%) patients shows Negative urease test with no significant correlation seen (P-value=0.067) (Table 2).

Table 3 shows significant correlation in comparison of positive urease test male gender patients to those female patients in this study 183 (51.5%) male patients samples showing positive tests in comparison to majority of female patients 77 (77%) recorded as having positive Urease test with P –value equal to 0.02, with no significance when comparison done between positive and negative urease tests among male patients (P-value =0.33) while strong significant relationship seen in comparing positive urease test for those female patients with Negative one (P-value=0.001). No significant correlation reported when the study comparing the Negative results in both Genders (P-value=0.07)

All patients received eradication therapy for H. pylori infection for 4 weeks to show if there is a significant improvement of dyspeptic symptoms among those patients with positive tests. Table 4 shows that 105 (57.3%) of male patients shows a significant improvement after taking eradication therapy for 4 weeks while only 38 (49.3%) female patients showing that significant better feeling after well management with the same therapy with no significant correlation between both groups (P-value =0.07).

Discussion

Dyspepsia affecting (20-40)% of western population in which endoscopy reveals no ulceration all over the gastrointestinal tract. Those patients classified as having Non-ulcer dyspepsia [11, 12]. The etiology is not clear and the correlation between peptic ulcer and the presence of infection with H.pylori bacteria strengthen the relationship between these types of infection with Non-ulcerative dyspepsia [13-15]. Few studies reported that the management of infection with Non-ulcerative dyspepsia show improvement of symptoms more than placebo did [16].

In the current study it was founded that the male patients were more than those female patients with no such difference in their age with high percentage of smoker patients among male gender these result came concordant with other studies [17-18]. While other study shows that advancing age has an effect to increase the possibility of H. pylori infection among patients with non-ulcerative dyspepsia [19]. May be due to firstly larger sample taken in these studies different socioeconomic societies may be poor societies taken or decrease immunity in elderly. No significant correlation seen between patients with non-ulcerative dyspepsia and positive urease test for pylori infection (p-value=0.067) these result agreed with other different studies shows no significant correlation between infection with H.pylori and non-ulcerative dyspepsia [20]. In fact, well designed large studies should be done to prove the effect of the presence of h.pylori infection and non-ulcerative dyspepsia since many systemic reviews including small sample studies only report that effect while no large reviews with prolonged period assess this effect. At the same any weak association between infection and NUD not proved or excluded by any published work [21]. In the current study NUD in male patients showed to be significantly correlated with pylori infection which is not approved by other studies [21]. Current study result may be because small sample taken or chronic inflammatory process associated with H.pylori infection. 143 patients (55%) of patients showing relieve dyspeptic symptoms with no significant correlation between male and female percentages these result strongly agreed with other studies that shows that there is a benefit from using eradication therapy for h.pylori in NUD [22]. The current study result concerning eradication therapy benefit is disconcordant with many meta-analysis showing to specific benefit from giving eradication therapy because different definitions of NUD and reported side effect of therapy regarding gastric carcinoma. The case was pointed by the two meta-analyses published by Laine in 2001 [23] and Gisbert et al. in 2002 [24]. The previous two studies showed minimal effect of treatment of h.pylori with eradication therapy on relieving dyspepsia two another best randomized trial having a same idea by testing the effect of eradication therapy on relieving symptoms by comparing a two groups of patients one of them taking eradication therapy and placebo given to another group over a period of 1 year, No significant difference reported also [23-25].

Conclusion

There is significant correlation approved between infection with H.pylori infection and Non–ulcerative dyspepsia with minimal role of eradication therapy in relief of dyspepsia.

Effectiveness of an Education Program on Nurses’ Knowledge and Practice toward Nursing Management for Patients with Leukemia who are Undergoing Chemotherapy in Baghdad Teaching Hospital

Raghad Salih Mardan¹, Suad J. Mohammed²

¹MSc (C), Adult Nursing Department, College of Nursing, University of Baghdad, Assistant Professor (PhD), Adult Nursing Department, College of Nursing, University of Baghdad

Abstract

Pre-experimental design, using one group pretest-posttest design, is conducted to determine the effectiveness of an education program on nurses’ knowledge and practice for patients with leukemia who are undergoing chemotherapy. The study was conducted for the period from October 25th, 2018 to April 29th, 2019. The study included a purposive sample of nurses who deliver a bedside care to patients with leukemia. The study sample included (20) male and (20) female nurses. Self-report questionnaire is constructed. It encompasses (5) parts, first part deals with nurses’ socio-demographic characteristics, Part II Nurses’ Knowledge about Leukemia, Part III Nurses’ Knowledge about chemotherapy and Its Side Effects Part IV Nurses’ Knowledge about Nursing Management, Part V Observational Checklist for Nurses’ Practice.

Results: The study findings indicate that there are significant differences between (pre and post1-post2) regarding (nurses’ knowledge and practice for patients with leukemia).

Recommendations: The researchers recommend specific training courses for nurses with exam to get the benefit and to have effect on the oncology nurses’ knowledge and practice, oncology nurses must have a specific pre–oncology educational courses before participation in the oncology ward.

Keywords: Educational Program, Nurses’ Knowledge and Practices, Leukemia.

Introduction

Leukemia is a rapidly progressive malignant proliferation of white blood cell, normal white blood cells are produced in the bone marrow to fight infections, precursors in bone marrow or lymph tissue and their accumulation in peripheral blood, bone marrow, and body tissues. The blood cellular components originate primarily in the marrow of bones such as the sternum, iliac crest, and cranium. All blood cells begin as immature cells (blasts or stem cells) that differentiate and mature into RBCs, platelets, and various types of WBCs.

In leukemia, many immature or ineffective WBCs crowd out the developing normal cells. As the normal cells are replaced by leukemic cells, anemia, neutropenia, and thrombocytopenia occur. Furthermore, many immature or ineffective WBCs crowd out the developing normal cells (¹).

As the normal cells are replaced by leukemic cells, anemia, neutropenia, and thrombocytopenia occur. In leukemia, the bone marrow produces a large number of abnormal white blood cells. This affects the development of patient’s normal blood elements and can have serious clinical consequences including life-threatening problems with infection and bleeding. There are two main types of acute leukemia, each named after the type of cell that is affected: Acute Myeloid Leukemia and Acute Lymphoblastic Leukemia (²).

Leukemia requires timely intervention with special type of chemotherapy. Chemotherapy treatment is
prolonged and requires hospitalization for intensive chemotherapy regimens followed by frequent outpatient clinic visits for monitoring, blood product support and additional treatment (3).

Chemotherapy is given for different reasons. It can be given because it is the best way to combat the cancer. It can be administered because other treatments are not enough on their own to combat the cancer. It can be provided to help the patients live longer (4).

Nursing management for patients with leukemia needs specialized information. These information are necessary for making sure of safety for each patient’s life and for the nurses’ safety. So, the little negligence or mistake occur during chemotherapy treatment may result in adverse consequences for patients (5). The care plan for patients with leukemia should emphasize on comfort, minimize the adverse effects of chemotherapy, promote preservation of veins, manage complications, and provide teaching and psychological support (1).

Approximately, every three minutes, one person is diagnosed with a blood cancer and some of them are expected to be diagnosed with leukemia, lymphoma, or myeloma in Iraq at 2018. Prevalence is the estimated number of people alive on a certain date in a population who previously had a diagnosis of the disease. Relative survival compares the survival rate of a person diagnosed with a disease to that of a person without the disease.

Method

A pre-experimental design, using one group pretest-posttest approach was used to guide this study. This study was conducted at Baghdad Teaching Hospital in Baghdad City at hematology center. The study included a purposive, non-probability, sample of (40) nurses who work and deliver a bedside care to patients with leukemia who undergoing chemotherapy in Baghdad Teaching Hospital. The sample is comprised of (20) males and (20) females.

The study instrument encompasses five parts; part I is the demographic information sheet (age, gender, education, years of work in hospital, years of experience in blood diseases and training sessions). Part II is nurses’ knowledge about leukemia which includes (12) items.

Part III is nurses’ knowledge about chemotherapy and its side-effects which includes (9) items. Part IV is nurses’ knowledge about nursing management which includes (5) items.

The items in these parts are dichotomous. They are measured on 2-levels scale of (1) for incorrect answer and (2) for the correct answer.

Part V is the observational checklist for nurses’ practices. This part is comprised of (25) items for blood transfusion; (11) items for infection control; (16) items for administration of chemotherapy, and (7) items for nursing management of venous infusion. The checklist items are measured throughout observational techniques of employed and unemployed for (3) episodes.

A pilot study is carried out for the period of January 28th, 2019 to February 11th, 2019 in order to determine the validity and reliability of the study instrument. A test-retest reliability is employed for the determination of the study instrument stability. Pearson correlation coefficient is computed on responses of (10) staff nurses of Baghdad Teaching Hospital, Hematology center. Finding of this computation indicates that the correlation coefficient is (r=0.87) which is approving that the instrument is highly reliable measure for the phenomenon underlying the present study.

Data were analyzed using the statistical package for social sciences (SPSS) for windows, version 24.

Nurses are with age group of 20-29-years (55%) from both gender; male and female that show equal number (male= 50% and female= 50%). (45%) of them were graduated from nursing high school which is the highest percentage among educational level variable. More than half of nurses reporting 1-5-years of experience for working in nursing field (52.5%), more of their working years were in hematology ward that refer to (1-5) years with percentage of (72.5%). Regarding getting training courses about management of leukemia, (67.5%) of them showing that they get training courses; (57.5%) are trained inside Iraq and (10%) are trained outside Iraq.

f: Frequency, %: Percentage, M: Mean, SD Standard deviation, Poor= 0-60, Fair= 61-120, Good=121-180

This table indicates that nurses are showing fair level of practices toward management of leukemia during the pre-test time (95%). During the post-test I, more than half of nurses showing fair level of practices (52.5%) and the remaining are showing good level (47.5%). During the post-test II, more than half are show good level (55%) and (45%) are still showing fair level of practices.
Discussion

This pre-experimental study was designed to measure the effectiveness of an educational program nurses’ knowledge and practices about management of leukemia among patients undergoing chemotherapy.

The level of knowledge about the management of leukemia has improved for the majority of nurses over time. This finding indicates the positive influence of the administered educational program. This finding is consistent with that obtained by Shafik and Abd Allah (6) and El-Sawy, Ismail, Magdy, and El-Sam-Man (7) who concluded that nurses’ knowledge about leukemia has improved after administering the educational program. According to Knowles’s Theory of Adult Education, Knowles postulated a number of requirements for optimal education of the adult learner (8). Specialists in curriculum design need to take into account the learning environment, safeguarding that it is conducive to efficient adult learning. The instructional style should be taken into account. Contrary to children, adult learners may take themselves into account to be invariant in standing to their instructors, so they may not accept an authoritative teaching style. Knowles proposed that educators can minimize the frustration of adult learners by adopting self-direction, which enables learners to sustain a level of control over the direction of their learning and an explicit understanding of reason behind their taking on the learning initiative and how it can affect their real-world roles.

There was an improvement in nurses’ knowledge about assessment of leukemia over time. This finding reflects that the administered educational program positively nurses’ knowledge about assessment of leukemia. This finding was higher than that reported by who stated that More than half of the nurses 51.6% stated that they were able to evaluate the patients psychosocially, while 48.4% stated that they were not able to evaluate the patients psychosocially.

There was an improvement in the level of nurses’ knowledge about management of leukemia over time. This finding indicates that the administered educational program positively influenced nurses’ knowledge about the management of leukemia. This finding is congruent with that of Binner, Ross and Browner (9) who reported that there was an improvement in nurses’ knowledge about the management of leukemia post intervention.

Regarding nurses’ practices related to management of leukemia, the study findings demonstrated that such practices noticeably improved over time. This finding reflects the positive influence of the administered educational program in enhancing nurses’ practices related to the management of leukemia. This finding is consistent with that of El-Sawy, Ismail, Magdy, and El-Sam-Man (7) and Shafik and Abd Allah (6) who stated that nurses’ practices have improved after administering the educational program.

Conclusion

The administered educational program positively influenced nurses’ knowledge and practices related to management of patients with leukemia.

Recommendations

1. Nurses should be encouraged to attend specific meetings, programs, workshops and seminars concerning nursing management of leukemia, chemotherapy administration and side effect.

2. Continues implementation of training programs for all nurses who work in hematology center to update their practice and knowledge base.

Conflict of Interest: The researchers report no conflict of interest.

Funding: This study did not receive any funding from any agency.

Ethical Clearance: A permission to conduct this study was obtained from the ethical committee in the College of Nursing, University of Baghdad.

In Vitro and Molecular Assessment for Lead Tolerance in Aloevera L. Callus

Rana A. Hameed Al-Roomi¹, Hashim K. Mohammed Al-Oubaidi¹, Rana Hadi Hameed¹

¹Department of Biology, College of Science, Al-Mustansiriyah University, Iraq

Abstract

A biotic ecological stress element has negative influences on various characteristics of plant growth, crop productivity, and development. In the past few decades there were advances in plant molecular biology, physiology, tissue culture, and genetics, have greatly improved our perception of plant response to a biotic stress situations. In vitro culture may produce a suitable method for selection of heavy metal tolerant plantlets. Aloe callus were grown on media supplemented with 0.5, 1.0, 1.5, and 2.0 mg/l lead nitrate. Level of lead bioaccumulation, mineral status, and growth parameters of cultured callus were investigated. Results showed an increase in Pb accumulation with increase of lead concentration treatment, reaching 124.633 ppm at 1.5 mg/L Pb, in regard to PCR analysis, experiment included catalase (CAT), glutathione peroxidase (GPX), and glutathione reductase (GR) genes. Results revealed that the number of amplicons varied with increase of lead concentration treatment with the compare of control treatment.

Keywords: In vitro, lead tolerance, Aloe, callus.

Introduction

In vitro cultivation is a valuable technique in the selection of heavy metal tolerant cell lines that could be used as a source to regenerate plants resistant to hard environmental conditions.

Heavy metal pollution is constantly deteriorating, due to a sequence of human activities, inducing too many researches regarding with the mechanisms used by plants to counter their harmful effect (¹).

Propagation in vitro essentially begin with explants excised from mother plants grown subjected to in vitro conditions. Murashige and Skooge (MS) medium is a common vital plant tissue culture medium (²) extended with different mixture and concentrations of plant growth regulators (PGRs). The two fundamental PGRs often used are cytokinins and auxins which in ideal circumstances can prompt totipotent cells to form undistinguished cells called callus (³). Ashrafzedeh and

Useful alternative to genetic transformation would be acquiring the resistant plant material applying technique of in vitro selection (¹¹).

Hazardous environmental conditions demand a good understanding for mechanisms involved throughout crops response to a biotic stresses which request of applicable means to improve crop productivity undergo such conditions (⁷).

Gharsallah and his coworkers (⁸) cleared that characterizing and cloning genes in a biotic stress tolerant plants is consider an important application in present plant research, creating mutants with transformed phenotypes and physiological responses could be a powerful way to discover the biological function of genes in these plants. Despite a significance progress has been reached in remedial of environmental pollutants employing genetic engineering technology (⁹, ¹⁰), but efficient micropropagation protocol is necessary to effectively develop genetically modified plants. Useful alternative to genetic transformation would be acquiring the resistant plant material applying technique of in vitro selection (¹¹).
The HMs are known to cause oxidative stress in plants by disrupting plant growth and metabolism\(^4\),\(^{12}\). Thus an extra important procedure is the activation of antioxidative enzymes which neutralizes reactive oxygen species (ROS) produced by HMs stress\(^3\),\(^{13}\),\(^{14}\) clearly, plants which cannot evolve an efficient resistance mechanism, can barely survive in HM-polluted regions. Rosa and her coworker\(^15\) cleared that Plants have developed mechanisms that can preserve cells from heavy metal cytotoxicity, as the cytosolic detoxification through linking to metal-binding particles as metallothioneins, and phytochelatins which play a critical role in heavy metal detoxification and homeostasis of intracellular metal ions in the tissues of plants. Production of reactive oxygen species (ROS) is a common factor for stress, and they are not only toxic to plant cells but also have a significant role as a signaling molecule. And in order to regulate the level of ROS, plants have evolved a complicated antioxidant defense system to scavenge the ROS\(^16\). The antioxidant system involves different enzymes such as glutathione reductase, superoxide dismutase, ascorbate peroxidases, and glutathione peroxidase\(^17\).

The major aim for this experiment was to study the effect of various lead nitrate concentration on callus growth and the mineral status of Aloe plant during in vitro selection, the other purpose of this project was the possible selection of clones tolerant to lead.

**Materials and Method**

**Plant material and culture medium:** Sterilized Explants (leaves) of *Aloe vera* L. were excised and cultured in universal tubes containing MS medium\(^2\). Different concentrations of the auxin 2,4-D were tested\(0,5, 1.0, 1.5,\text{and } 2.0 \text{ mg/l}\) which incubated in dark at a temperature 25 ± 1 °C for callus initiation\(^18\).

**Lead treatment:** In vitro selection was conducted using MS medium supplemented with Pb(NO\(_3\))\(_2\). Four different concentrations were tested: 0.5, 1.0, 1.5, and 2.0 mg/l Pb(NO\(_3\))\(_2\) plus the control treatment, ten replicates were tested for each treatment. Cultures were maintained in a growth chamber at 25 ± 1°C with a three-week subculture interval.

**Evaluation of callus growth:** Fresh and dry weight of callus were calculated, using three replicates for each treatment in the auxin 2,4-D experiment, while regarding the heavy metal experiment using Pb(NO\(_3\))\(_2\) five replicates were used for each treatment.

**Results and discussion**

**Callus growth:** Data in table-1 shows a significant differences using 2,4-D at different concentrations (0.5-2.0) mg/l on fresh weight of callus in regard to control treatment which no callus was initiated, yet the dry weight of callus recorded a significant difference at 1 mg/l 2,4-D reaching 0.112 mg/l. Table -2 indicate no significant differences in fresh and dry weight of callus using different Pb concentration comparing with control treatment.

**Table 1:** The effect of 2,4 D concentration on fresh and dry weight mean of *Aloe vera* callus in mg

**Lead (Pb(NO\(_3\))\(_2\)) treatment:** Table -3 demonstrated that there was a significant difference in Pb contents
in callus at all Pb concentration treatments showing an increase in lead accumulation with the increase of concentration treatment giving the highest amount at 1.5 mg/l Pb treatment recording 124.633 ppm. The table also reveals that Ca, Mg, Mn and Fe elements decreased significantly with increasing Pb concentration levels, while Co element show the opposite behavior reaching 12.097 ppm at 1.5 mg/l Pb. Data in table-3 displayed that Cu element give the highest amount of concentration in callus at the control treatment reaching 13.913 ppm which differed significantly than all other treatments. Yet the Na element recorded the less concentration amount at 1.5 mg/l Pb treatment reaching 31.60 ppm. These results in agreed with Alina et al. 2015, for the effect of lead on shoot culture of Daphne sp.

PCR analysis for cat gene Figure 1 indicates that the control was different than the other treatments of Pb showing only one fragment about 100 bp, while in increasing concentration of lead, Fig. 1 shows two fragments of DNA with 100 and 400 bp. for CAT gene.

Li and his coworker (21) reported that the overexpression of phytochelatin synthesis in Arabidopsis leads to improve arsenic tolerance however incredibly to cadmium hypersensitivity. Consequently, new method could provide to expose the complexity of plant tolerance to heavy metal stress (15, 22).

Fig. 2 display the DNA fragments amplified in PCR for GPX gene, the results revealed that the highest number of amplicon was in control and 0.5mg/l Pb concentration with length varied from about 100-500 bp. and that the fragments decreased in number with the increase of Pb concentration in callus. Induced stresses using ascending mutagenesis levels generates a random distributed mutations all over the genome, for this reason using chemical mutagenesis could be used not only in understanding the role of a specific genes function but also to select a tolerant species (23, 24).

concentration of Pb in callus giving two fragments with about 100 and 350 bp. in compare with control which showed one fragment about 100 bp.

Figure 3: Amplification of G3 gene extracted from DNA Alloe vera callus; M = 100bp ladder DNA, 1 = control, 2-5 = lead concentration treatments, -ev = negative control

ROS could result in DNA strand breakage, defragmentation of proteins, and damage of photosynthetic pigments, which may trigger cell death, plants response to ROS with antioxidant defense mechanism by synthesis of antioxidant enzymes such as catalase, superoxide dismutase, and glutathione reductase, that act as the scavengers of free radicals\(^{(25,26)}\). Obriuchava and his coworkers\(^{(26)}\) reported that Phaseolus vulgaris and Pisum sativum plants, the seed coat is easily absorbent to Pb, and that the presence of lead salt prevented seeds from germinating. Abolghassem and his coworkers\(^{(27)}\) cleared that the toxic effect of Pb is on cell division and elongation, and there are many mechanisms involved in decrease of rate of cell division and some of these mechanisms include direct binding to DNA, metal-induced defect, and reduction of the glutathione pool.

The objective of this study was to develop an in vitro protocol for Aloe vera as a necessary first step for biotechnology studies as molecular physiology gives greater understanding into characteristic genes that control metal accumulation and we may identify a range of gene families that are likely to be involved in transition metal transport.

Expression of APOBEC3H Isoenzyme on the Level of Protein in Breast Cancer Patients

Rebaz Moatasam, Kamaran Kayani

1MSc Student, Department of Medical Microbiology, Faculty of Health and Science, Koya University, Koya, 2Assistant Professor, Department of Chemistry, College of Science, University of Salahaddin-Erbil, Iraq

Abstract

Breast Cancer is a disease that results from the alteration of the cellular genome in breast tissue and can lead to the second cause of cancer death in human so that it is an object of intensive research. APOBEC3H is a member of APOBEC3 sub-family of DNA cytosine deaminases, which have evolved as a crucial role of innate immune defense and have been contributing to cancer development throughout genetic mutations. Eighty subjects were conducted to this study, forty subjects for each breast cancer patients and healthy group. Blood samples were analyzed for this study. After clotting blood sera were used to determine the quantity of APOBEC3H protein by Elisa technique. This study demonstrates that APOBEC3H expression on the level of protein is significantly down-regulated in breast cancer patients compared to that of a healthy group. This study reveals that the APOBEC3H expression on the level of protein can be used as a potential biomarker for predicting breast cancer with the significant high value of AUC.

Keywords: APOBEC3H, biomarker, breast cancer.

Introduction

Cancer is a genetic disease that results from an accumulation of mutations in which a group of cells become abnormal and grow out of control1, 2. Breast cancer is the second most common cancer leading cause of death in developed countries and usually affects the women, though it’s rare among men about one percentage3. It is a complex disease resulting from the disorganized proliferation of cells that compose breast tissue. About 95% of malignant breast tumours are carcinomas, which originate from the epithelium of the mammary gland4.

Genomic DNA is being continuously damaged and therefore, requires continuous DNA repair5, 6. Away from spontaneous cytosine hydrolysis, uracil can also be formed by cytidine deaminase7. The dCdeaminases all belong to the APOBEC family of deaminases in higher eukaryotes8. Apolipoprotein B mRNA editing enzyme, catalytic (APOBEC) family are capable of editing cytosine in single-stranded DNA (ssDNA) through a deamination reaction that converts it to uracil (C-to-U)9. In higher primates and humans, 11 APOBEC isoenzymes are involved at various stages of the immune response10, 11. These isoenzymes are activation-induced deaminases (AID), APOBEC1, APOBEC2, APOBEC3A-H, and APOBEC411, 12. All members of the APOBEC family share at least one zinc-3 binding catalytic domain with the consent amino acid sequence11,13,14. The human APOBEC3 family comprises of seven members arranged on chromosome 22, containing one or two zinc binding deaminase domains, namely, APOBEC3A-APOBEC3H13.

APOBEC3H developed from ancestral genes at least 33 million years ago during primate evolution and it is the most divergent member of the APOBEC3 family and has a single Zn-binding domain that refers to the unique Z3 group15. The APOBEC3H protein is the most polymorphic member of APOBEC3 family with seven reported haplotypes (hap I-VII) which are formed from various combinations of polymorphisms that influence the protein stability and its activity against HIV16. In addition to the human APOBEC3H haplotypes, four
distinct splice variants containing different C-terminal regions, namely sv-154, sv-182, sv-183 and sv-200. The numbers express the length of the proteins in amino acids\textsuperscript{16}.

The APOBEC gene family was initially reported to play critical roles in virus restrictions\textsuperscript{17}. Recently, aberrant expression in APOBEC gene family was strongly associated with breast cancer development. In this study, we will investigate the expression profiles of APOBEC3H on the level protein in breast cancer patients by using enzyme-linked immunosorbent assay (ELISA) technique.

**Material and Method**

**Sample collection:** The samples were collected from the Hiwa Hospital, Sulaymaniyah, Iraq. A total of 80 samples were analyzed. The study included 40 paired normal and tumor samples of patients that were grouped according to the types of breast cancer (Table 3) and the clinical characteristics of the patients, including the average of age and grade. The blood samples of the breast are stored at -80\(^\circ\)C until further analysis.

Informed consent was taken from all participants and the study approved by the local ethics committee. Approval number: 02.07.2018/137.

**Protein expression analysis:** In ELISA, different antigen-antibody combinations are used, always including an enzyme-labeled antigen or antibody. ELISAs can give a useful measurement of antigen or antibody concentration. Human (APOBEC-3H) ELISA Kit was used to detecting the level of human (APOBEC-3H) in serum samples, which uses a double-antibody sandwich (ELISA). Firstly have been prepared reagents, samples and standards according to this manufacture instruction kite. The blank wells were labeled with all of the materials which include in this kite except sample sera and apobec3h antibody. In the test walls, 40 µl of the sample sera were added, and then added both APOBEC-3H (10 µl) and streptavidin-HRP (50 µl) to the monoclonal antibody-enzyme well which is precoated with human APOBEC-3H monoclonal antibody. So, gently mixed and incubated for 60 min at 37\(^\circ\)C and washing with 30x concentrate washing buffer to remove the uncombined enzyme. Subsequently chromogenic solution A (50 µl) and B (50 µl) were added to each well gently mixed and incubate for 10 min at 37\(^\circ\)C, that caused to change the color to blue. Finally stop solution was added about 50 µl into each well to stop the reaction; the well color becomes yellow. The Chroma of color and the concentration of the Human APOBEC-3H of a sample were positively correlated.

**Statistical analysis:** For a case study, the data were expressed as interquartile. Statistical analysis was carried out using one-way analysis of variance (ANOVA) by using Graph pad prism (Version 6). Independent t-test was used for comparing the measured parameters between patients and control group. Receiver Operating Characteristic (ROC) curve is a graphical display of sensitivity on a y-axis and (1 – specificity) on the x-axis for varying cut-off points of test values. Area under the curve (AUC): this is a useful quantitative measure of accuracy. An area of 1 represents a perfect test; an area of 0.5 represents a worthless test. A rough guide for classifying the accuracy of a diagnostic test is the traditional academic point system: 0.90-1= excellent (A) 0.80-0.90= good (B) 0.70-0.80= fair (C) 0.60-0.70= poor (D) 0.50-0.60= fail (F).

**Results and Discussion**

**Determination of APOBEC3H in breast cancer patients and control subjects using ELISA:**

APOBEC3H, as mentioned above, has a protective role in cellular regulation against viral infection and cancer\textsuperscript{16}. It is considered that APOBEC3H as well as play a positive role in breast cancer. To check the expression APOBEC3H on the level of protein, it is useful to estimate the APOBEC3H protein either by western blotting or ELISA. For this purpose, it is decided to perform the experiments using the Elisa method. These data show that the level APOBEC3H in sera of patients is significantly lower compared to the control group (Table 1 and Figure 1).

The present study is the first to investigate breast cancer in the level of APOBEC3H and found it is down-regulated. Previous studies showed that these mutations in the APOBEC family are prevalence in more than half of human cancer, and the majority of these mutations are in a single tumour\textsuperscript{18}. Recent studies have demonstrated that APOBEC families are involved in cancer development\textsuperscript{18}. It has been reported that the APOBEC3A, APOBEC3B, APOBEC3C, and APOBEC3G are up-regulated in different cancer types such as breast cancer, liver, ovarian, gastric, T-Cell lymphomas and lung cancer\textsuperscript{19-23}.

It is interesting to demonstrate for the first time that the expression of APOBEC3H is downregulated
in breast cancer. This could be due to the interaction of the miR-103a-2-5p with a target gene of APOBEC3H in the position 3'UTR. These may lead to suppressing the translation of the target gene, namely APOBEC3H. The overexpression of the other different isoforms of APOBEC3 family may be due to the interaction of miR-103a-2-5p in the position 5'UTR, and this may cause the up-regulation of the APOBEC3 proteins.

Figure 1. Box plots of the relative concentration of APOBEC3H protein in breast cancer patients and controls.

Diagnostic accuracy of differentially expressed genes: For early diagnostic of pathogenesis and biomarkers, programs for community awareness and advances in therapeutic technique lead to decrease mortality and reduce side effect prognostic and predictive biomarkers for breast cancer. These biomarkers could provide further information about the status of the tumour and its development. Because of serological and histochemical parameters are not informative enough to predict the outcome of the disease or efficacy of the therapy.

In this study, APOBEC3H has been identified as a potential biomarker, and it has an AUC value of 0.803 with the p-value of 0.0002 on the level of protein (Table 2 and Figure 2). This new finding reveals that APOBEC3H is a good biomarker that could provide diagnostic accuracy that can be efficiently used for early detection, prognosis, and therapy of breast cancer. It has been demonstrated that autoantibodies are present in all stages of tumour progression: carcinoma in situ, primary invasive breast cancer and in metastatic disease, because the level of autoantibodies was significantly higher in the sera from cancer patients compared with the controls. Recent studies identified the autoantibodies to p53 in the serum of breast cancer patients. Additionally, the level of Autoantibodies to specific cancer-associated glycoforms of MUC1 is higher in early stage breast cancer patients than in women with healthy women. The detection of APOBEC3 isoforms and their genetic aberration could provide a potential biomarker for diagnostic, prognostic and therapy in breast cancer, this may be due to the C/G-to-T/A hypermutation in different cancer types such as breast cancer, ovarian cancer, prostate cancer, brain cancer, and head/neck cancer.

Figure 2. Receiver operator characteristic curve (ROC) was used for APOBEC3H on the level of protein.

Conclusion

This study has investigated for the first time the expression of APOBEC3H on the level of protein in breast cancer patients. The APOBEC3H on the level of protein is differentially expressed in breast cancer patients compared to control group where reduced. Also, APOBEC3H expression can be used as a new biomarker to identify the high risk of breast cancer due to high AUC.

A Study of Complications of Infants of Diabetic Mothers in Babylon Teaching Hospital for Maternity and Pediatrics

Rebee Mohsin Al-Ithary

Department of Pediatrics, College of Medicine, University of Babylon, Hilla, Iraq

Abstract

Background: Infants born to diabetic mothers are liable for a wide range of systemic & metabolic complications.

Objectives: The aim of this study was to do early detection and early managements of signs and symptoms and complications that happened in infants of diabetic mothers. Also to show the outcome of infants of diabetic mothers.

Materials and Method: Medical history, physical examination, and investigations (biochemical & radiological) were done on 100 infants of diabetic mothers over about 5 months period. Results: we found that 78% of cases delivered by caesarean section, and 55% of them have history of affected baby, 27% history of miscarriage & 9% chronic sibling morbidity & these results might be due to poor glycemic control, bad antenatal care, or maternal & social neglect. Macrosomia was 42%. Congenital anomalies include congenital heart disease 16%, Birth trauma occurs in 5% in form of fracture clavicle & brachial plexus injury. Hypoglycemia presented in 85%. Perinatal mortality, birth injuries, systemic, hematologic & metabolic complications are more encountered in infants born to diabetic mothers.

Conclusion: Infants of diabetic mothers have a lot of risky complications and they need screening even in asymptomatic cases.

Keywords: Complication, infant, diabetic mother.

Introduction

Infants of diabetic mother are those born to a mother who has persistently elevated blood sugar during pregnancy. (1)

Diabetes has long been associated to maternal and perinatal morbidity and mortality (2,3). Since the discovery of insulin; infants of diabetic mothers have experienced an almost 30 fold decrease in mortality and morbidity. (3) of mothers with preexisting diabetes, 35% had type 1 diabetes mellitus, and 65% had type 2 diabetes mellitus. (4)

Maternal hyperglycemia causes fetal hyperglycemia, which contributed to that complications on infants of diabetic mother. (5)

Hyperglycemic hyperinsulinemic state leads to fetal macrosomia which causes birth asphyxia, cardiomyopathy, respiratory distress syndrome, polycythemia and iron abnormality which in turn lead to poor neurodevelopmental outcome. (6)

Chronic fetal hyperglycemia and hyperinsulinemia increase the fetal basal metabolic rate and oxygen consumption leading to a relative hypoxic state. The fetus responds by increasing oxygen-carrying capacity through increased erythropoietin production, potentially leading to polycythemia. (7)

Prior to birth, elevated insulin levels inhibit the maturational effect of cortisol on the lung, including the production of surfactant from type 2 pneumocytes. This puts the fetus at risk for developing respiratory distress syndrome. (8)
Other comorbidities include miscarriages, birth defects, metabolic disturbances such as hyperglycemia, hypoglycemia, and hypoxia. Growth Restriction occurs in pregnancy because of underlying vascular disease. Hyperinsulinemia results in excessive fetal growth. All organs are involved except the brain and kidney.

Birth injuries e.g. shoulder dystocia, brachial plexus injury, and cephalhematoma are also common. Hypoglycemia especially occurs in early hours of life which may be asymptomatic or symptomatic like irritability, lethargy, poor feeding, and seizure.

Those infants are also liable for pulmonary disease e.g. RDS and primary pulmonary hypertension, hyperbilirubinemia, polycythemia, hypocalcaemia with or without hypomagnesaemia believed to be secondary to parathyroid hormone suppression.

Cardiomyopathy and interventricular hypertrophy may occur in these infants and detected by echocardiography.

The aim of this study was to do early detection and early managements of signs and symptoms and complications that happened in infants of diabetic mothers. Also to show the outcome of infants of diabetic mothers.

Materials and Method

From 3754 neonates admitted to Babylon maternity and pediatrics teaching hospital at period from 1st April 2009 to 17th August 2010 we found 100 neonates of pregnant diabetic mothers. We took history from those mothers regarding type of diabetes, its treatment, parity, age, history of affected neonates or miscarriage, and calculated gestational age, also we looked for type of delivery and its events.

We studied in neonates of diabetic mothers, the early moments of life regarding APGAR score, resuscitation, examinations, early investigations needed accordingly and managements.

We look for biochemical and radiographic abnormalities in those neonates as follows:

Serum blood glucose which taken by peripheral venous blood examined by spectrophotometer or by glucometer digital measuring total serum bilirubin taken by heel prick test read by bilirubinometer, packed cell volume taken from peripheral venous sample, serum calcium by non-tourniquet venous sample, blood culture taken via cleaning the punctured area with alcohol and take venous sample for suspected cases of sepsis. Chest X-ray, echocardiograph, electrocardiograph, abdominal ultrasound and brain ultrasound & CT scan of brain as needed.

Results

64% of mothers have gestational diabetes, 36% as pre-existing DM, 27% are primigravida & 35% have age less than thirty years, 78% neonate delivered by caesarean section, male neonates 58% & females 42%.

History of affected baby 55% as we regard macrosomia as congenital malformation & history of miscarriage 27%. Sibling with history of chronic morbidity 9%.

Regarding hospital staying: 1st day discharge 16%, 2nd day discharge 22%, 3rd day discharge 46%, & 4th day discharge 16%.

Perinatal Mortality rate in these one hundred cases are 4% due to (two with complex congenital malformation, one with still birth, & one from respiratory failure), morbidity rate 85% as medical & biochemical abnormalities need intervention only 11% are apparently normal & from those 11% are nine mother with strict glycemic control.

The APGAR score 30% have less than 4 score in 1st minute & increase to more than 4 score at five & ten minutes as 78% & 93% respectively.

In 1st day of life 85% have respiratory rate more than 60 breath/minute while at the 4th day the respiratory rate less than 60 is 68%. The grunting present in 85% in 1st day & become 20% at the end of the 3rd day of life.

The oxygen saturation improve in 9% of patients whom complain of hypoxia at 1st. day to reach 4% at the 4th. day of life.

The heart rate > 160 beats/minute in 1st day was 10% & only 2% still tachycardia at the end of the 3rd. day of life.

Hypoglycemia improve from the 1st. day to the 4th. day as 86% to 4% respectively.

The hematocrit > 65% present only in 9% & only 3 patients need partial blood exchange transfusion.
The respiratory complications was about 33% as hyaline membrane disease & transient tachypnea of newborn 45%, 2% complicated to respiratory failure, 1% pneumothorax, 1% eventration of diaphragm (Figure 1).

![Figure 1: Percentages of respiratory complications proportions](image)

In relation to the cardiac complications seen in 16% as following 6% have murmur in 1st. four day of life, and 7% have heart failure documented by chest X ray and echocardiograph, 3% have VSD, 1% PDA, 1% ASD, cardio myopathy in 2% (Figure 2).

![Figure 2: percentages of cardiac complications](image)

Regarding intestinal complications: 2% have Intestinal obstruction, 1% imperforated anus, 1% had diaphragmatic hernia.

The neurological abnormalities seen in 24% as following: 20% as birth asphyxia, 2% intracranial hemorrhage, 2% neural tube defect, 1% facial palsy as in Figure 3.

The skeletal complications as: 1% congenital dysplasia of the hip, 1% absent left hand & 5% has shoulder dislocation with or without clavicular fractures (Figure 3).

![Figure 3: The neuro-skeletal complications proportions](image)
Genito-renal abnormalities as 2% undescended testes, 1% hypospadias, 1% single kidney.

Neonatal jaundice present in 40%, one fifth of them in 1st. day & about half appear in the 2nd. day of life & 12 patients (12%) need blood exchange transfusion. The body weight from 2-3.5 kg about 48%, ≥ 4.6 kg about 52%, as in Figure 4.

![Figure 4: percentages of body weight proportions.](image1)

**Discussion**

In our study, we found 78% of cases delivered by caesarean section which is higher than the results found by Cousins which is 45% & this might be due to bad obstetric history, fetal macromomia, failure of induction of labor, or obstetrical miscalculation.(18)

We found 55% have history of affected baby, 27% history of miscarriage & 9% chronic sibling morbidity & these results might be due to poor glycemic control, bad antenatal care, or maternal & social neglect.

![Figure 5: Differences between our study & compared study regarded macrosomia, perinatal death, & congenital heart disease.](image2)

Macrosomia is 42% but in Thomas R. Moore (15-45%) & to Charles F. Potter (26%). This might be due to good glycemic control in their study.(19)

Perinatal mortality was 4% which is highly different to results in study of Charles F. Potter which was about 30-50% & specially to infant with gestational diabetes, this might be due to small number of my study as in figure 5.(20)

Congenital anomalies include congenital heart disease 16% which is closer to 16% by Moore & slightly lower than Charles F. Potter 24% & hypertrophic cardiomyopathy 7%.(19) Birth trauma occurs in 5% in form of fracture clavicle & brachial plexus injury which is relatively similar to the result of Thomas R. Moore about 4% this might due to macrosomia, or need of assisted vaginal delivery. (19)

Hypoglycemia present in 85% which higher than the result of Moore where the result about 62%.(19)

Respiratory distress syndrome about 33% which is slightly higher to 26% of Thomas R. Moore & it is statistically significant, this might due to increased incidence of cesarean section or prematurity & this could be supported by about 40% is the percent of prematurity by pediatric examination in this study. (19)

Jaundice was seen in 40% of cases while 25.5% in Moore could be caused by hemolysis or polycythemia.(19)
Polycythemia seen in about 9% which is closest to 5-10% of the result in Thomas R. Moore & this could be the result of fetal hypoxia as in figure 6. (19)

Figure 6: Differences between our study & compared study regarding hypoglycemia, respiratory distress syndrome, jaundice & polycythemia.

Hypocalcemia was seen in 10% in compare to 6% result of Thomas R. Moore (19). Preterm by clinical examinations are about 40% while show 29% by Charles F. Potter. (7)

Conclusion

There is good relation between strict glycemic control & near normal neonates, so fetal life without hyperglycemic state & without subsequent hyperinsulinemic state lessen complications & vice versa. It is important to screen for neonatal hypoglycemia even in asymptomatic patients because a lot of patient have asymptomatic hypoglycemia. Neonates of diabetic mothers have a lot of risky complications to be screened for. Good dietary techniques & doing caesarean section decrease the risk of birth trauma (in our study we show about 80% of affected neonates with perinatal injury were due to normal vaginal delivery). Most teratogenic complications occur in infant born to mother with diabetes that is poorly controlled.

Ethical Clearance: The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki. The study protocol and the subject information and consent form were reviewed and approved by a local Ethics Committee.

Conflict of Interest: None of the authors have any conflicts of interest relevant to what is written.

Funding Source: University funding was provided for: data collection, analysis, and interpretation; trial design; patient recruitment. No public funding was received.

Acknowledgments: Author would like to express her thanks and gratitude to Prof. Alaa Al-Charrakh (University of Babylon) for critical reading of the manuscript.

Impact of Social Support on the Periodontal Health among Population of Pregnant Women in Javanese Ethnic Group

Retno Palupi1, Olinne Juzika2, Sarah Fitria Romadhoni1

1Department of Dental Public Health, 2Graduate Student of Dental Health Science, Faculty of Dental Medicine, Universitas Airlangga

Abstract

Introduction: The Javanese are the largest ethnic group in Indonesia. 87.84% of Indonesia’s population who suffer from dental disease also experience periodontal abnormalities. Severe periodontal diseases in a pregnant women can produce inflammatory mediators that can threaten the fetal placenta thereby increasing the chance of a preterm birth. Social support provided by the family can bring out a positive attitude and motivation for the mother to maintain oher health during their pregnancy.

Objective: This study aimed to find out the impact of social support from the closest family of a pregnant women on their periodontal health.

Method: This was an observational analytic study with a cross sectional design. The population in this study is pregnant women from Javanese ethnic group in the Pucang Sewu Public Health Center in Surabaya city, Indonesia. Sample calculation was determined using the simple random sampling technique and the sample size was 49 pregnant women. The data were analyzed using the spearman correlation test and multiple linear regression test.

Results: In this study 65.3% of pregnant women had periodontal abnormalities in the form of gingivitis. This study found several predictor factors that linearly related to the occurrence of periodontal problems in pregnant women, these are: oral hygiene status (p = 0.002); the action of pregnant women in maintaining oral health and oral hygiene (p = 0.026); family support (p = 0.012); family knowledge (p = 0.005).

Conclusion: Family support has an impact on the occurrence of periodontal problems in pregnant women.

Keywords: Periodontal diseases, social support, pregnant women, premature birth.

Introduction

The Javanese are the largest ethnic group in Indonesia, which originating from Central Java, East Java, and the Special Region of Yogyakarta. At least 41.7% of Indonesia’s population is Javanese. The results of the household health survey, 60% of the Indonesian population suffer from dental and oral diseases, one of the most common oral disease in Indonesia is periodontal disease with the prevalence of 87.84%. Periodontal disease is a dental and oral disease whose prevalence is still high. Periodontal disease is the second most common disease suffered by people in Indonesia, which is ± 73.50% and 4-5% of the population suffers from advanced periodontal diseases1,2

The birth of low-birth weight babies (LBW) at this time is still a problem in the reproductive field in both developed and developing countries. According to the World Health Organization (WHO), LBW babies are babies with birth weight less than 2500 grams and born before 37 weeks of gestation. Births of LBW babies are a major contributor to perinatal mortality and the short and long-term illness of neonates2,3
Factors that can cause LBW are includes maternal infections, malnutrition, history of preterm birth, preterm ruptured membranes, exposed to substances toxic (drugs, cigarettes, alcohol), maternal stress, the low of socio-economic status, lack of prenatal treatment, hypertension, diabetes, genitourinary tract infections, neonatal sepsis, multiple pregnancies, as well as several other unknown factors.\(^3,4,5\)

During pregnancy, support from people who are considered as close and important could motivate the pregnant woman. The husband is the first and foremost person in giving encouragement to his wife compared to the other. The support provided by the husband continuously will certainly bring out a positive attitude and motivation for the mother to maintain their oral health during pregnancy.\(^4,6\)

This family support is expected to encourage a pregnant women to have an interest in maintaining their oral health so as to give rise to a supportive attitude in terms of maintaining oral health.\(^5,6\)

Based on secondary data regarding the visit of pregnant women to dental clinic in the Pucang Sewu Public Health Center, periodontal abnormalities (gingivitis and periodontitis) and pulpititis are the most common oral health problem. Based on this background, this study is aimed to find out the impact of social support from the closest family of a pregnant women on their periodontal health.

**Subjects and Method**

This study was an observational analytic with a cross sectional approach. This research was conducted in the working area of Pucang Sewu Public Health Center which includes these villages: Pucang Sewu, Kertajaya, and Baratajaya. The population in this study were all pregnant women with various trimesters included in the work area of Pucang Sewu Public Health Center, with total population of 92 people. Total sample in this study were 49 pregnant women obtained through simple random sampling technique with a trust value of 90\% (Z1-a = x), 75\% the value of statistical power, and the possibility of errors of 10\%.

The dependent variable in this study is the periodontal health status of pregnant women. The independent variable in this study is the behavior of family support for the efforts of pregnant women to maintain their oral health (knowledge, attitudes, actions), behavior of pregnant women (knowledge, attitudes, actions to clean their teeth, and actions to visit the dentist), and status of the oral cavity of pregnant women. Data collection uses the OHI-S index (Oral Hygiene Index Simplified) and CPI (Community Periodontal Index). The OHI-S index is used to determine the level of oral hygiene, and the CPI index is used to observe the severity and degree of periodontal diseases (gingivitis, periodontitis) in an individual (or in a section of a population).

### Findings

Based on table 1, the result of the gestational age data showed that the respondents were mostly at the third trimester of their pregnancy (42.86%), with the level of education were mostly an elementary/junior high school graduates (48.98%). The results showed that most of the respondents were a housewife (65.30%), most of them have health insurance (BPJS) (79.59%) with all of them were from the Javanese ethnic group (100%). In this study, we found that the majority of those who support pregnant women socially were their husband (67.35%), with the education level of the husband were mostly an elementary/junior high school graduates (48.98%), most of the husband worked as an entrepreneur (65.30%) and used health insurance (BPJS) (79.59%).

</tbody>
</table>

Based on table 2, variables that have a positive relationship were; (1) Action of family support to enhance efforts for pregnant women in maintaining their oral health and oral hygiene with the respondent’s attitude (coefficient R: 0.528, p-value: 0.000); (2) Respondent’s attitude with respondent’s action to maintain their oral hygiene and oral health (coefficient of R: 0.359, p-value : 0.012), (3) Respondent’s action to maintain oral hygiene and oral health with the level of oral hygiene (coefficient R: 0.286, P value : 0.049); (4) Respondent’s action to maintain oral hygiene and oral health with the periodontal status of pregnant women (coefficient R: 0.293, p-value : 0.041); and (4) Level of oral hygiene with the periodontal status of pregnant women (coefficient of R: 0.438, p-value: 0.002).

In addition, the results of the study also showed that oral hygiene status, respondent’s actions in maintaining oral health and oral hygiene, family attitudes, and family knowledge had a linear relationship to the periodontal health. These all were the predictive factors that could impact the periodontal health in pregnant women. The results of ANOVA test showed that these variables have a significance value of $P < 0.05$, which states that there is a linear relationship between these variables and the dependent variable.

The relationship between the dependent variable and the independent variables is known from the significant value of $P < 0.05$, each independent variable (oral hygiene status: 0.002; respondent’s action to maintain their oral health and oral hygiene: 0.026; family support attitude : 0.012; family knowledge : 0.005).

In pregnant women, social support from family is proven to have a good impact on pregnant women, such as increase the chance for them to give birth to babies with ideal body weight, prevent premature births, and can improve the mother’s quality of life.

Epidemiological research was conducted on 49 Javanese pregnant women in PucangSewu Village, Surabaya City, Indonesia. The results of this study indicated that the most prevalence of dental and oral diseases that experienced by pregnant women in Pucang Sewu Village was periodontal disease. There are many factors that can trigger the problem. Based on the results of the analysis, we found several factors that can influence the periodontal health problems of pregnant women. Based on research conducted at Pucang Sewu Public Health Center, it was found that the knowledge of pregnant women about dental and oral health is related to their periodontal health. This is supported by research by Zhong et al (2015) which showed that there was a relationship between knowledge of pregnant women and oral health status. In addition, in this study it was also found that oral hygiene status was related to the periodontal health status of pregnant women as indicated by the coefficient of R: 0.4387.

Factors of knowledge, awareness, and behavior of the community towards maintaining dental health are influenced by various social demographic factors, including the level of education, environment, economy, tradition, and the presence of dental health service.
facilities in the area. An individual’s education can influence the level of oral hygiene, someone who has a low education has insufficient knowledge to maintain their oral hygiene\(^{10,11,12}\)

People who have higher education could have a better oral hygiene level because they pay more attention to the condition of their oral health. Based on the results of the study, 30.6% of families were cared and supported pregnant women to maintain their oral health. The results of data analysis showed that family support has a relationship with the respondent’s attitude (coefficient R: 0.528) and the respondent’s attitude is one of the predictor factors for the occurrence of periodontal problems (P-value : 0.005)\(^{11,13}\).

The relationship between the respondent’s actions in maintaining oral hygiene with the periodontal health status can be proven from the significance value (P-value : 0.012). In addition, the respondent’s action has a correlation with the oral hygiene status (R: 0.286) and periodontal status (R: 0.293). Lertrpimonchaid et al (2017) stated that the act of maintaining good oral hygiene will also affect the oral hygiene status as well. In this study it was also found that a person who has moderate to low OHI-S level will have a risk five times greater to experience periodontal disease than those who have a good OHI–S\(^{14,15}\).

**Conclusion**

Based on the results of this study, it was found that family support have a correlation with the attitude of pregnant women in an effort to maintain their oral health and also that the attitudes from family have a linear relationship with periodontal health of pregnant women.

A Single-Centre Experience Study in Percutaneous Nephrolithotomy (PCNL) at Al-Safeer Surgical Specialized Hospital

Riyadh R. aal Toma¹, Ali M. Muhsen²

¹FICS Urology, University of Kerbala College of Medicine, Chief of Surgical Department, ²FICS Urology, Al Safeer Surgical Specialized Hospital, Department of Urology

Abstract

Aim: To evaluate our gained experience in PCNL surgery and its effectiveness in treated various cases with renal stones.

Method: A retrospective study compromise 3146 patients underwent PCNL in single center of surgical hospital from 1st January 2013 to 1st January 2018. A questionnaire was used to collected data. Surgical and postsurgical parameters were reported.

Result: Patient’s gender male 56.4% , female 43.6%. PCNL done on 47.9% right sides, 50.5% left and 1.6% bilatera l. 71.4% were opaque stones. 9.1% of patients were Pediatrics, 86.8% adult’s and 4.1% Geriatrics. Mean Stone measures (mm)32.9±15.3. Mean operative time (mints) 36.5±17.2. Mean Hospitalization (days) 1.5±0.8. The entrance approach to kidney: upper 64.7% , lower 20.50% , middle 10.70% and multiple in 4.13% . The stone free rate were 96.9%. Intraoperative complication were: Bleeding 0.8% , Pleural injury 1% , and Bowel injury 0.1%. Postoperative complication: Sepsis 1.3% and transient impairment of renal function 0.3%.

Conclusion: For large kidney and upper ureteral stones PCNL is effective procedure with minimal morbidity even in the presence of anatomical variation and experience play important role for good results.

Keywords: Nephrolithotomy, Hydronephrosis, Ureteral stone, Karbala.

Introduction

PCNL is a the procedure of choice for patients with large kidney and upper ureteral stones and it has the greatest success rate for the treatment of large renal stones. Percutaneous trocar nephrostomy for hydronephrosis opened the door of a new technique done by Goodwin WE and coworkers¹ about 50 years ago. Since then, the procedure of percutaneous nephrostomy has been refined and has vastly enriched the armamentarium of the contemporary urologist².

Initially, percutaneous nephrostomy used only for urinary diversion; subsequently it has been used for more complex procedure such as stone extraction³.

The revolution of minimally invasive surgery began in 1976 when Fernström and Johansson performed the first percutaneous nephrolithotomy (PCNL)⁴. Subsequent reports on PCNL from the Mayo Clinic⁵ and the University of Minnesota⁶ and from West Germany⁷ and England⁸ established PCNL. Further refined and advances in technique and equipment have allowed urologists to perform percutaneous stone removal with increasing efficacy and decreasing complications⁹.

Developments in stone fragmentation, newer instruments and improved fluoroscopy have increased the versatility of percutaneous surgery. Flexible, steerable nephroscopes have allowed access to all parts of the kidney¹⁰. The indications for open surgery
in stone disease have thus become greatly reduced. However, in spite of all these developments, PCNL may be complicated by residual stone. Sometimes, complete clearance of stones may not be possible with every effort through a single percutaneous subcostal tract. They can be dealt with second look intervention through a mature nephrostomy tract. However, it prolongs the hospital stay and increases the morbidity. Large stone burden also can be dealt with multiple tracts for complete clearance of stone. Therefore, in case of large stone burden with predictive chance of residual stone or when single percutaneous tract does not offer complete stone clearance, creating multiple tracts may be a useful alternative. Untreated large staghorn calculi had a high 10 year mortality of (28%)in comparison with surgery(7.2%)\(^\text{11}\). In 2005, the clinical practice guideline report for the management of staghorn calculi by the American Urological Association guidelines 4 panel confirmed that percutaneous treatment of staghorn calculi should be first-line treatment for most patients\(^\text{12}\).

**Method**

A retrospective study compromise 3146 patients underwent PCNL in single center of surgical hospital from 1\(^{st}\) January 2013 to 1\(^{st}\) January 2018. When a diagnosis the patient with renal stone that eligible to PCNL surgery by ultrasound, KUB and sometimes with I.V.U or CT scan, an appointment were given for surgery. Once the anesthesia takes effect, the patient putted in lithotomy position and a cystoscopy inserts to inspect the urinary bladder, then a tube (catheter) inserts into the ureter to kidney and injects a special dye through the tube, which travels to the kidneys. This radio-opaque dye highlights the kidney stones on an X-ray. After that patient turned into prone position, once X-ray, a 1.5 cm incision made on patients back, locates the stone and through it, accesses the kidney with an x-ray guided fine needle. With the help of a guide wire, single dilators create an access passage to kidney. Once the passage is created, a hollow tube through which a nephroscope targeting the stones is inserted. Finally, the removal of stones through the scope using a grasper to retrieve stone after fragmentation by pneumatic lithotripsy. For multiple stones in the kidney, this procedure may be repeated through other access sites, if required, until all the stones are removed. Post the operation, a soft tube or catheter is left through the incision for a couple of days to drain the urine directly from the kidney into a drainage bag but sometime the tube were not inserted if un-eventable procedure carried out, also double J stent were inserted into ureter for three weeks. A follow up of patients at one and three months by KUB and ultrasound with complete blood pictures and renal function to assess patient’s wellbeing and stone free rate.

**Result**

The operative time divided into three parts: less than 30 min. in 41.40%, 30-60 minin 49.77% and more than 60 min. in 8.84%, so most of surgeries done in less than 50 min.This time defined as a time from entrance of needle to putting of nephrostomy tube.

The entrance approach to kidney depended on distribution of renal stone were as follow: upper which most commonin 64.7%, lower in 20.5%, middle in 10.7% and finally multiple approach which were useful in staghorn stone in 4.13%.

The patients gender were slightly different : 56.4% male and 43.6% female, the age distribution as follow: 9.1% were pediatrics (less than 16 years), 86.8% adults (16-65 years) and 4.1% geriatrics (more than 65 years). PCNL done in 47.9% right, 50.5% left and 1.6% bilateral side, 71.4% were opaque and 28.6% lucent stone in present study, stone measures were from 10mm to 83mm. Finally, hospitalization of patients from one to ten days depend on patients welling and occurrence of complication postoperatively.

In present study PCNL done in abnormal or especial considered kidney like 1.7% Single functioning kidney, 0.9% Horseshoe kidney, 0.8% Double moiety, 0.3% Intra-renal pelvis, 0.1% mal-rotated kidney, 0.1% Kidney with retro-caval ureter and 0.1% Polycystic kidney

The PCNL were a major surgery so a complication could occurred, the intraoperative complication were 1.9% as follow: 0.6% Bleeding treated by transfusion, 0.2% Bleeding postponed PCNL, 1% Pleural injury and 0.1% Bowel injury.

While postoperative complication were 1.9% as follow: 1.3% Sepsis, 0.2% Transient impairment of renal function and 0.1% death. The stone free rate were 96.9% and residual stone found in 7.1% in follow up of patients. PCNL done in special requirements patients in present study as mention in table above: 9.6% of patients did previous renal surgery, 1.1% required neuro-axial anesthesia, and 0.5% had Hepatitis positive tests.
The distribution of renal stone in present study, which were 36.50% staghorn stone, 33.20% pelvic, 14.60% lower calyx, 8.70% middle calyx, 6.60% upper calyx and 0.40% upper ureteric stone.

Discussion

In present study, 3146 patients undergo PCNL in single center (Al Safeer surgical hospital), the mean age of patients in present study were 37.7±39.8 years and they distributed as 56.4% male, 43% female from those 9% were pediatric, which comparable to Satyagraha et al\textsuperscript{13} which had mean age 42.2 years, 62.9% male and 37% female while in Agbo et al\textsuperscript{14}; there were comparable age but higher male to female ratio, largerandomize sample of present study gave more unbiased data. The stone free rate were 92.2%, optimum preparation of patients with good facilities and progression of experience played important role for this high percent, so this agree with Agarwal et al\textsuperscript{15} were 87.7% free rate reported. The approach to renal system in present study as follow: 67.7% upper, 30.9% lower and 4.1% multiple tracts, this result were different from others study like Ganpule et al\textsuperscript{11} and Agbo et al\textsuperscript{14} in which lower approach 98.2%, good experience and assisted of anesthesia team by stopping ventilator at time of entrance were causes for high percent of upper approach, in addition this gave good access to renal pelvis and increase stone free rate which agree with Gupta et al\textsuperscript{16}. In present study 71.4% of stone were opaque and 28.6% were lucent which comparable to Pradère et al\textsuperscript{17}, while stone distribution were stag horn 36.5%, 33.2%renal pelvis, lower calyx 14.6%, mid calyx 8.7% and upper calyx 6.6%, while in Satyagraha et al\textsuperscript{13} stag horn 9.5%, 28.5% pelvis and 23% in lower calyx, in others hand 47.9% of stones were at right side, 50.5% at left side and 1.6% had bilateral renal stones which comparable to Holman et al\textsuperscript{18} where 55%
right and 45% left side stone, finally stone measures in present study were 32.9±15.3 mm.

The mean operative time were 36.5±17.2 minutes which was less than Agbo et al\textsuperscript{14} 58.8 minutes and Hegarty et al\textsuperscript{19} 60-100 minutes, the usage of single dilators during surgery, and less complex stones in our study were decrease time of surgery.

The PCNL was major surgery so complications were inevitable, in present study hemorrhage require transfusion 0.6%, this not agree with Lojanapiwat et al\textsuperscript{20} 2.7% required transfusion, another important complication were pleural injuries 1% which more than Agbo et al and Lojanapiwat et al\textsuperscript{14, 20} due to more frequency usage of supra-costal approach but it was less than Ravichandar et al\textsuperscript{21} where pleural injuries 7.1%, bowel injuries reported in 0.1%in present study which managed conservatively, also it was less than other study Ravichandar et al\textsuperscript{21}, the avoiding usage of lateral punctures played important role to decrease this complication.

Sepsis occurred in 1.8% despite usage of prophylaxis antibiotics, it was agree with Sukumar\textsuperscript{22} 1.8% but less than Shah et al\textsuperscript{23} 4.1%.

Renal impairment reported in 6.2% of cases, most of these patients already had renal impairment in addition to occurrence of septicemia in patients who has had risk factors like diabetes or steroid depended patients, these data were comparable to Lojanapiwat et al\textsuperscript{20}.

In present study PCNL done in patients with 1.7%Single functioning kidney (1.7%), Horseshoe kidney(0.9%), Double moiety(0.8%), Malrotated kidney(0.1%), Kidney with retro-caval ureter (0.1%) and Polycystic kidney(0.1%).

Also in present study, PCNL done in patients whose needed special requirement as follow: the neuro-axial anesthesia used in 1.1% of patients who has had risk for general anesthesia with inevitable outcome, also 0.5% of patients had hepatitis finally 9.6% did previous renal surgery.

Ethical Clearance: Informed written consents were obtained from all participants in the study, and were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The Medical Ethical Committee of The Iraqi Board for Medical Specializations approved this study [CODE: 20015; date, 24-03-2017].

Evaluating the Vitality of Coccoid form of Helicobacter Pylori by a Transmission Electron Microscope Study

Saba Abdulsalaam Hamid AL-Sultan

Faculty of Medical Biology, Department of Anatomy, Ninevah College of Medicine, Ninevah University

Abstract

Most studies, if not all, emphasize that the coccoid form of (Helicobacter Pylori) is the dead form of this bacteria, because of incapability of growing this bacterium in the culture media used in growing the spiral form of the same bacteria. The coccoid form doesn’t have a vital role in infection, so it has no biological or medical importance. Hence, the aim of this study is to evaluate the vitality of coccoid form by using the Transmission Electron Microscope (TEM) technique. The sample consisted of (54) patients attending endoscopy unit at Ibn-Sena teaching hospital in Mosul/Iraq. The Oesophago-gastro-duodenoscopic (OGD) findings of these patients were gastritis, duodenitis, gastric and duodenal ulcer. Two biopsies were taken from all patients, and each was submitted to bacteriological and histological examination by Light microscope (LM) and TEM.

Keywords: Transmission, Oesophago-gastro-duodenoscopic, CO\textsubscript{2} and NH\textsubscript{3}, H. pylori.

Introduction

The common form of H. pylori is the spiral form with circular ends. It seems like a sea-gull in the tissue sections, and at the direct microscopical examination of the homogenized biopsy. However, it is pleomorphic when they are cultured on solid media \cite{1 & 2}. This bacteria can be changed into a coccoid form in certain and improper conditions, among the factors resulting in such changes is starvation in culture media with long period of incubation in addition to the exposure to oxygen, alkaline pH, high temperature, and treatment with the hydrogen ion pump inhibitor and antibiotics \cite{1,3 & 4}. A symptomatic colonization of the spiral form to the mucosal layer of gastric antrum in (50%-60%) of person. At the beginning and if the case was left without treatment, it causes chronic superficial gastritis which may develop into peptic ulcer, lymphoma or chronic atrophic gastritis which will become a risk factor of gastric adenocarcinoma. Such bacteria can tolerate the high acidity of stomach by secreting the enzyme urease which changes urea into CO\textsubscript{2} and NH\textsubscript{3} in order to balance the acidity. Stimulation of the inflammatory response due to colonization of the gastric tissue can lead to chronic antral gastritis associated with infiltration of inflammatory cells into gastric mucosal layer \cite{5,17}.

From the above mentioned characteristics, it is concluded that the spiral form has a very precise feature in colonizing the gastric tissue on special receptors due to its potential vitals in colonization of gastric tissue. The medical and biological importance of the coccoid form, in terms of transporting disease and infection, hasn’t been determined yet. It has not been known whether the coccoid form has the ability to colonize the gastric tissue, to make tissue changes as the spiral form, and to cause the inflammatory stimulation of the gastric tissue. Many questions need to be answered in order to know whether the coccoid form represents an active, inactive or dormant phase. Accordingly, the aim of this study is to evaluate the vitality of coccoid form throughout bacteriological and histological examination using (TEM) technique.

Materials and Method

1. Samples: Biopsies from (54) patients coming to the endoscopy unit at Ibn-Sena teaching hospital in Mosul City/Iraq were taken. According to the endoscopic diagnosis, symptoms of these cases are related to the diseases of digestive system, ranged among gastritis, gastric ulcer, duodenitis and duodenal ulcer, they are treated by the Amoxicillin. These cases have been chosen also depending on the results of Al-Sultan; the positive diagnostic tests of H. pylori, in these cases, have been ranged between
Two biopsies from gastric antrum were taken from each patient. The first was put in a Stuart’s transport medium to be inoculated in culture media for bacteriological tests. The other was put in the Fixative Para Formaldehyde Gluteraldehyde (FGA) used in TEM technique.

2. Bacteriological Tests:

First: Direct Microscopical examination of homogenized biopsy: Samples were taken to the laboratory, as soon as possible (within two hours), under sterile environment. It is homogenized by putting it in (1.5 cm³) of sterilized phosphate buffer saline PBS (0.9%) which is within a specific sac of Stomaker device, it is treated with this device for five minutes. The first of these tests is the direct microscopical examination of homogenized biopsy, which has been made by preparing membranes fixed on the slides and staining them with gram stain to note the form of bacteria inside the tissue before culturing them. The biopsy mixture is also used in the following bacteriological tests.

Second: Urease test: We did this test depending on the procedure of Lee:6 urea solution (2%) and phenol red reagent are used to detect H. pylori by putting (100 µl) of homogenized biopsy in urea solution.

Third: Culture of H. pylori: Brucella agar was used in this study because it is the best media of growing this bacterium, according to Al-Sultan. This test has been used to show the ability of the coccoid form to grow in the culture media, and then to make a comparism between the results of this test and the histological test.

3. Histological Examination by TEM: Test has been made by putting the biopsy in the FGA for two hours, and then fixed by Osmium tetroxide for another two hours with stirring constantly and then dehydration by forwarding the biopsy in ascending concentrations of acetone (25%, 50%, 75%, and 100%). After that, clearing is made by putting the sample in Xylol. At that time, the sample will be ready for embedding process which is at first in Durcopan 1, and then embedding and polymerization it in a mixture of Durcopan. At this time, the plastic block will be ready to be prepared. The plastic sections are of two types: thick and ultrathin one. (The biopsies have been treated to make the plastic block, and to stain the thick section and the ultrathin one in Mosul College of Medicine/University of Mosul. The Electron Microscopical examination and microphotography, has been done in the Unit of Electron Microscope in the College of Science / University of Irbid /Jordan).

Preparation of the thick and ultrathin plastic sections: The thick plastic section (0.5–2 µm), is stained with Toluidine-blue and examined with Light Microscope (L.M.), and the ultrathin plastic sections (600-900ºA), were stained with uranyl acetate and lead citrate, and examined with (TEM).

Results

Urease test was positive in 96.3% (52/54), whereas the results of direct microscopical examination were less positive 75, 93% (41/54). This difference owing to the nature of spotty colonization of bacteria; they do not exist in the excised biopsy, despite their infection to the gastric mucosa. It is to be noted that both forms are observed during the direct microscopical examination of homogenized biopsies.

The histological study of the thick plastic with (LM) and the ultrathin plastic sections with (TEM), showed that both coccoid and spiral forms were existed in all (100%) control samples (fig. 1), whereas in the samples of negative culture, the results showed the spiral form in only two biopsies out of eighteen (11.11%), and the coccoid form in 15 (83.33%) (fig. 2).

The following findings are also shown in figure 2:

First: Vacuoles have been formed in the epithelial cell of gastric antrum infected with the coccoid form (fig. 2,a). The TEM pictures in (fig. 2,b & f) shows vacuoles existing within the epithelial cell and the coccoid form existed within these vacuoles.

Second: The mucosal layer has been eroded and exfoliated, as it is shown in (fig. 2,c & e), it also shows that there is a structural deformity and changing in the glandular form of the patient’s tissue infected with the coccoid form. In addition, we can see destruction in the glandular tissue containing the coccoid form.
In addition to infiltration of bacteria inside the epithelial cell, in figure (3,a) of TEM and (fig.3, b & c) of L.M. we can observe the infiltration of coccoid form inside the glandular tissue and beyond the epithelial cell and their basement membrane in the lamina propria.

Third form of H. pylori had been discovered in this study as shown in (fig. 4), it is between the spiral and the coccoid; (transformant form). As shown in its first phase (fig. 4,a), the bacteria are shortened and changed the spiral form into a form similar to vibrio. In the second phase, the bacterium is C-shaped connected at their ends with a common filament representing the form before the coccoid, as shown in (fig. 4, b & c).

Third: Stimulation of the infiltration of the inflammatory cells (fig. 2,d), there are chronic inflammatory cells in the gland pit, like plasma cell and lymphocyte accompanied with the existence of coccoid form which probably proves that the bacteria created an immune response causing the chronic active gastritis.

Fourth: Infiltration of the coccoid form into the cytoplasm of epithelial cell adjacent to the nucleus, as shown in (fig. 2, f). In this figure, we also see a contraction of the infected cell with the coccoid form, a contraction of its nucleus and a change in the form of its nuclear material existing inside the nuclear membrane of the genetically active Euchromatin to the genetically inactive Heterochromatin. That has been known by condensation of nuclear material.

Discussion

Many method were used to evaluate the vitality of coccoid form in keeping its capability of colonizing the gastric tissue and creating the infection, like the capacity to synthesize protein, cultivability, integrity of DNA, nucleic acid content, urease activity, vacuolating cytotoxin (Vac A) activity and capability of adhesion on the epithelial cells. The gastric tissue is one of the hardest organs in the human body from the point of its colonization by bacteria, due to the peristaltic washing which make it resistant to adhesion of bacteria and the thick layer of mucus and the gastric acidity being near to (pH=2). However, the spiral form could overcome these difficulties, colonize and damage the gastric tissue due to having many virulence and maintenance factors representing in producing the urease enzyme, which balance the gastric acidity in the micro environment surrounding the bacteria and (Vac A), that participates in damaging the mucosal layer defense, as well as the phospholipase enzyme, which destroys the phospholipids bi-layer, and the mucinase enzyme, responsible on digesting the mucus layer. But, one of the most important requirements of infecting the epithelial cell and then the gastric tissue is its capability of adhering on the epithelial cell.

The results of histological examination in this study, according to the cases with negative cultures were 83.33% (15/18) treated by amoxicillin have the coccoid form (fig. 2). This has been also proved by Berry and his group in an in-vitro study when he treated the spiral form with a low concentration (0.05mg/ml) of amoxicillin and he noticed that the bacterial form changed from the spiral to coccoid. The vacuole formation within the epithelial cells accompanying with the coccoid form in our results (fig. 2,a,b & f) was similar to the vacuoles resulted from the infection with the spiral form. This is an evidence for the ability of the coccoid form to produce (Vac A), as Wang and his group confirmed throughout his genetic analysis of the gene responsible for producing (Vac A) in both forms. He noted the correspondence of sequences of nitrogen base of the gene in coccoid and spiral forms are equal, in addition, he got the point that there is no influence on the structure of DNA of H. pylori, after treatment with antibiotics. In other research, he proved that changing into coccoid form in liquid media after incubation of 31 days despite the decreasing levels of DNA and RNA in the H. pylori, and the bacteria still have the activity of (Vac A) and Urease genes. According to urease enzyme, as shown in the result of this study, it gives a high rate of positivity which is 96.3%, for the samples of study involving the sample of negative culture.

It has been seen documented that there is a numerous number coccoid form in human stomach in patients with Adenocarcinoma. It is to be known that the Adenocarcinoma is a pathological development of infection with such bacteria, in case of treatment failure. In other words, it can be said that the coccoid form may be a potential disease phase with unexplored high risk probably it uses an unexpected and unknown mechanism in stimulating the inflammatory response and in developing the gastric adenocarcinoma. Despite the ambiguous role of the coccoid form, we can confirm that it is a vital and disease phase, in addition to its high biological importance. According to the stated results of this study and the others, the infection of the coccoid form has successfully occurred in mice.

Conclusion

Results 96.3% (52/54) were positive for urease test, H. pylori existed during the direct microscopic examination of homogenized biopsy in 75.93% (41/54). We were able to isolate H. pylori on Brucella agar media in two-third of cases 66.67% (36/54) of biopsies, however, the rest of biopsies 33.33% (18/54) were negative. Those 18 biopsies have been specifically studied in this research for the coccoid form. The results showed the ability of coccoid form to adhere in certain positions of the surfaces of the epithelial cells, by forming pedestal, and then making the histological changes in cases mentioned above gastritis, duodenitis and peptic ulcer. The coccoid form of H. pylori has a vital pathological role similar to the spiral form. It is a viable dormant form, and it has a biological and medical importance, in addition to its responsibility for transmission of infection and disease reoccurrence.

Abstract

Education in Iraq experiences a period of development based on the nature of the age, which is committed to changing the curriculum and its objectives and means. Education today depends on the useful function of what we learn as the facts of science could be applied in the real life. Understanding the nature of the learning process is one of the problems faced by workers in that field. The same is one of the most important problems addressed by the teacher of education as it interferes in all educational means, education is a process through which the one may acquire new experiences based on the old experience it could change the mind of the learner according to the previous experience and make a new change. Football became one field in the scientific research which tries to find the best way for learning. The researcher offers the use of programmed education in the learning of football for the gymnasiums where the sports activity using the educational programs has an important impact on the learning process.

Keywords: Healthy programs, learning mental skills, physical education.

Research Problem

Sports activities are so different, including individual, collective and Futsal activities, which occupies a prominent position among the various sports and being taught in all faculties of physical education and sports science as a basic course, which requires submission to the educational and educational method approved by the scholars of education, and the two researchers to teach football For the halls, teaching and mastering skills requires more than this time, which leads to the delivery of information to students without mastery. It is also through teaching the traditional way of explaining and modelling through the teacher and applying by the students without any effort from Before the students in the attempt to improve and gain led to the attention of the teacher in the technical aspects of education to be able to end the teaching of skill on time without consideration of the educational and social aspects in the lecture, and it follows that the contact between the teacher and the student limited to give instructions, in addition to the traditional method with narrow The time has led to a lack of attention to the level of low-level students in an attempt to reach them to the required level, as well as the distinguished ones as an attempt to upgrade their level to reach the highest level of their abilities, due to the lack of taking into account individual differences between students in this way used e.

Research Objectives: The research aims at learning some of the basic skills of Futsal using programmed education through:

1. Preparing a booklet for teaching the basic skills of Futsal.
2. To understand the effect of programmed education in learning the basic skills of Futsal.

Research Hypotheses:

1. There are statistically significant differences between the pre and post-tests of the control group members for the benefit of the post-test.
2. There are statistically significant differences between the pre and post-tests of the experimental group members in favour of the post-test.
3. There are statistically significant differences between the effect of programmed education and traditional education in all tests in favour of programmed education.

Research Keywords:

Programmed Instruction: Is a tool which enables the individual to self-teach by means of a program designed in a way that allows the information to be divided into small parts and arranged in logical and behavioural order so that the learner responds gradually
and immediately verifies the validity of his response until he finally reaches the desired behavior.

**Research Methodology:** The researchers used the experimental approach in the design of the first experimental group and the other control using pre and post-tests, in order to suit the type and nature of the research.

**Research Population:** The research population consists of students in the second stage of the Faculty of Physical Education and Sports Sciences at the University of Maysan, Republic of Iraq for the academic year 2017-2018 - including (65) students.

**Research Sample:** The sample of the research was randomly selected from the students of the second stage in the Faculty of Physical Education and Mathematical Sciences at the University of Missan, Republic of Iraq for the academic year 2017-2018. The number of students was 40, divided into two groups (control group and experimental group).

**Types of programming:** In short, programming can be considered as the process of ordering instructional material in a series of steps that leads the learner to self-learn from one goal to another, a new unknown object that is more difficult and complex. Thus, the learner starts from an initial goal until it reaches a definite final goal through small steps called each the types of programming are:

1. **Linear Program:** It is one of the contributions of Skinner and his collaborators. It is based on analysing the study material into separate parts, each called a frame. The lines are followed in a straight horizontal line, and the questions are presented directly in the linear program so that the student thinks and writes his answer based on what he studied in previous tires.

2. **Skipping Program:** This type depends on the tires of the pope asking the student about a particular subject or ask him to perform a certain skill if the response is correct to ask him to skip or jump a group of tires that explain this subject or skill and accurately to another frame provides a next step or new material and here does not walk student In a straight line it is not related to the tires within the program, but the extent of his understanding of the subject and ability to performance and the speed of compatibility and linking topics, and therefore characterized by this type that does not disrupt the excellent student does not re-explain the skill or subject possible performance, but the weak student is walking in the program without jumping From frame to socket.

3. **Intrinsic Programme:** This method of programming developed by (1), called the real program intrinsic programme and frames in this method related to sub-frames of more than one idea may be up to three ideas, and the question is usually a choice of multiple, and the student chooses to answer if it is correct takes the following frame In the main sequence, if it is wrong, it takes the frame that explains the error from the sub-frames. It may give examples or comparisons and then draw a new frame to make another attempt to choose the correct answer, so the sub frame here is called the Remedial Frame and then the learner returns to the program President To create a new attempt and thus puts the program in front of the student several alternatives to walk in accordance with the rate or direction.

**Steps To Prepare The Program:** It is stated by (2) that there are some scientific steps that contribute to the construction of the educational program, can be referred to in the following:

1. Fit the program to the target sample.
2. Taking into account the characteristics and number of the sample.
3. Serve and develop the required expertise.
4. Be in line with material and human potential and time.

While (4) confirms that the steps to build the program are summarized as follows:

1. Define the objectives of the program to be prepared and they must be clear, specific and detailed.
2. Determine the starting point of the program.
3. Identification of the scientific material to be presented in the program in the light of the objectives already identified.
4. Determine the system in which the skill will be presented in the program.
5. Writing the program tires.
6. Experimenting and modifying the program.

**Building the program:** It is pointed out by (5) that the foundations of building the program are:
1. Taking into account the characteristics and growth of the Sunni stage of learners.
2. Taking into account the capacities and individual differences
3. Ease and variety and simplicity of the program
4. Mechanisms for stimulating learners
5. Distribution of work to the appropriate extent (activity and rest).
6. Provide the appropriate time and place to implement the program.
7. Content is consistent with the program objective.
8. Accountability of security and safety factors.

Football in Halls: Sports in our modern era are no longer just a means of playing and recreation in leisure time, but it is a basic need for man in this age. Physical education plays an effective and effective role in the development of the individual’s abilities in all its various aspects of mental, psychological, social and kinetic as a meaningful educational activity with direct effects. In view of the development of science and knowledge in many areas of sports, including football, the game has received a large share of the attention of researchers, which reflected the development of method of play and plans and The rules that contributed to give aesthetic in the performance of players and increase the enthusiasm of the public, and among those method is the game of Futsal, which is one of the method of the game as a cornerstone for the development, as well as the skills and plans and events and unexpected positions in the game. Everyone wants to practice and watch because of the ease of their law, the small space of the stadium and the small number of players and similar skills with the basic skills of football (Soccer), which led to the practice by a large number of players.

Conclusions
1. The educational program using the programmed education applied to the experimental group led to a significant improvement in the level of skill performance in favour of dimension measurements.
2. The method used to explain the basic skills of football to the gyms has partially influenced the improvement of the skills of the control group.

Recommendations: In light of the research objectives and results, followed by the conclusions, the researchers recommend the following:

1. The need to use programmed education because of its positive impact on increasing the output of the educational process.
2. Direct the results of this research to the staff of the Iraqi Olympic Committee to benefit from these results.
3. Conduct more studies and scientific research using different educational method when teaching the basic skills of all activities in general and the futsal in particular.

Prevalence of Anxiety Disorder among Medical Student of Mosul University Iraq

Shatha Abdul-Rahman H. Al-Ghurairi
PhD Community Medicine, Lecturer, Clinical Nursing Sciences Department/Nursing College, Mosul University, Iraq

Abstract

Background and aims: Medical education and profession are among the most challenging and most worrying ones. Anxiety represents an escalating public health problem among medical students. The objective of this study was to verify the prevalence & predictors of anxiety disorder among medical students in Mosul University /Mosul/ Iraq.

Material and Method: So a cross- sectional study was carried out during December 2017. A random sample method was used to select 225 medical students. A confidential & self administered questionnaire included Standardized Taylor scale of honest anxiety was used.

Results: Among 200 respondent students, 129 (64.5%) were female and 71(35.5%) were male. (37%) of participants aged 18 & 19. Among these participants 7 (3.5%) were smoker, 4 (2%) of them are smoke hookah. Among the participants 63 (31.5%) had no anxiety while 37 (18.5%) had panic state. 109 (54.5%) see dreams cannot told anyone, and 151 (75.5%) are want to be glad like others.

Conclusion: Medical students in Mosul university had high prevalence of anxiety in comparison with others. educational problems and major life events were the main predictors.

Keywords: Anxiety in medical student, stress in medical student. Introduction

Anxiety disorder is one of the most frequent mental disorders of community that affects the quality of life. Anxiety causes exaggerated effects on the economy of society. It impairs the physical and psychological aspects of human being. Hospitals are associated with human’s life and death, their environment is very stressful. Several studies have been approved that there are different stressors that can increase the prevalence of anxiety state among medical students. Studies have shown that several stressors such as vast amounts of new information, alterations in study method and longtime period of medical education, extreme working hours, difficult types of exams, sleep deprivation, difficulties of finding a job, in addition of social, emotional and family factors can pressure their learning ability and lead to college failure were affect students’ lives and lead to anxiety state and other mental disorders of medical school education. The atmosphere of medical schools and colleges is a stressful work place that considerably affects the educational performance, psychosomatic health of the students. These stressors in addition to negative effects on the educational performance can affect their personality pattern. Depression and suicide may be seen in physicians and medical students. Medical education across the globe is seeming as being obviously stressful. Over burden of information provides a reduced chance to relax and restore and leads to disturbance in sleep pattern, reduced concentration, decrease in self-esteem, along with mental health status like increased anxiety and depression. A medico encounters various stressors in terms of academic pressures and its resultant outcome measured in terms of success in the evaluation process and long term objective to settle down in the coming future as well as adjustment to the new environ in the medical school was necessary. Therefore it becomes very important to study the overall mental health status and mainly prevalence of anxiety among medical students as these comprise neglected public health problems in Iraq. It is very significant to prevent the ill sequel of anxiety on one’s academic achievement.
through early detection and effective intervention actions. For that reason, the present study was undertaken with the aims of this study to assess the overall anxiety state in medical student, to determine any history of drug abuse taken during examinations and smoking state and to describe some factors influencing anxiety among medical students at Mosul University.

**Methodology**

A cross-sectional study was conduct at Mosul medical college, from 1st of December 2017 to 1st of January 2018. Medical students of all academic semesters from 2013- 2018, from Mosul medical college were incorporated in the study. There were a total of 225 students in the 1st, 2nd, 3rd, 4th, 5th and 6th year. Students who were accessible at the time of data gathering and who were fulfill the selection criteria were give details about the study and taking oral consent was established by the students at time of data gathering. Any students enrolled in Mosul medical college may be incorporated mean there is no exclusion criteria. Two hundred students outside 225 may had the questionnaire with self administered and after finishing point of questionnaire they were convey them to the investigator. Therefore, 200 students were incorporated in the study with a response rate 88.9%. The chosen student were included by random sampling technique in which any student may be included in study. Then all information of questionnaire were considered which comprised of socio-demographic and educational variables, smoking condition. In addition to that all the information needed to evaluate the different levels of anxiety were collected through the use of questionnaire form and Taylor scale of personality\(^\text{(6)}\) and Taylor scale of Honest Anxiety (Arabic version)\(^\text{(7)}\) which sought information about each system. After correction of scale; deficiency areas were detected & taken as a sound base for the construction of the final form of the questionnaire. A 50 questions that was needed to assess anxiety state. Computer feeding and statistical analysis were carried out. The descriptive numbers was analyzed as proportion of anxiety condition among the medical student. The indicators were weighted, and the anxiety scores were computed for each student in the survey.

**Results**

During one month period spend on data collection from Mosul Medical College. Two hundred students are collected to represent all grades of the college.

Discussion

Youthful is a point of an identity-forming time in which individuals practice societal and bodily changes, as well as a variety of conflicts in behavioral, academic, economic and sexual areas. A numeral studies have paying attention on the mental health of medical students as a higher medical school is well thought-out to be a point of considerable psychosomatic distress for physicians in training. Some aspects of training may have inadvertent harmful effects on medical students’ emotional & mental wellbeing. Several studies show a high prevalence of anxiety conditions among medical students with levels as an in general psychological distress consistently higher than in the universal population and age harmonized peers. This study was conducted to assess an anxiety state in students of Medical college in Mosul University. In this study, 68.5% of the medical students had anxiety, which was steady with more than that in other studies.
conducted in the USA (49%) (11), Brazil (40.2%) (12), Pakistan (43.89%) (13) but similar to the University of Beirut (69%) (14) and undergraduate Chinese medical students 60% (15) according to that Pakistani studies. alternatively, the prevalence of anxiety in medical students was higher than that of the UAE (28.7%) (16), Turkey (27.1%) (17), Sweden (12.9%) (18). In Indian study anxiety symptoms were present in 66.05% which is go in parallel with the current study (19). The difference from other studies may contribute to many reasons like might be the variation of instrument used to appraise anxiety or that the stressors in our country such as lack of security conditions is a major cause of anxiety. Regarding, female gender was significant with progress of anxiety analogous to western studies which reported that many psychological distresses were higher among female students (20-25). This can be due to the basis that females have a higher proportion of psychiatric illnesses or there was a high entitlement of female students in the present study 64.5%. Moreover, smoking behavior and drug abuse were also considered affect the prevalence of anxiety (26,27). As far as educational stressors are concerned, educational performance, oral examination & theory test criteria dissatisfaction and being overburdened with test program were extensively related with anxiety, suggesting educational stressors as being a source of mental distress among medical students (13,15,28,29). Most frequent source of stress in Nepal study were staying in a hostel and vastness of curriculum and tests/exams (23), while a study conducted in Pakistan found dissimilar stress factors such as drug misuse and presence of major psychiatric disorders in first degree relatives in a family (5,30). On the converse, in this study only 5 students which representing (2.5%) were found to have a drug abuse. In this study, the investigator was study the categories of Taylor scale of manifest anxiety which sought information about each system including sleep pattern, fear, nervousness, physical and cognitive symptoms. on the other hand, this finding cannot be supported by other studies as this categories are not been studied in this details.

**Conclusion**

Medical students in Mosul university had high prevalence of anxiety in comparison with others. educational problems and major life events were the main predictors. Enhancing facility for preventive & curative mental health services is suggested by beginning of stress management courses & enhancing educational advising services are essential when the medical education is established.

The Burden in Providing Caregiving Service to Mentally Illed Patients in Ponorogo

Sugeng Mashudi¹, Ah. Yusuf², Rika Subarniati Triyoga³, Kusnanto², Muhammad Suhron⁴

¹Faculty of Health Sciences Universitas Muhammadiyah Ponorogo, ²Faculty of Nursing Sciences Universitas Airlangga Surabaya, ³Faculty of Public Health Universitas Airlangga Surabaya, ⁴Faculty of Nursing Stikes Ngudia Husada Madura East Java Indonesia

Abstract

Introduction: The provision of caregiving to patients with a mental illness are under the burden of continuous and difficult processes. Some factors are responsible for this burden and the determination of these factors will help to address it. The objective of this study is to investigate the caregiver burden of patients with mental illness in Ponorogo.

Method: Sixty-seven caregivers of patients with mental illness in Paringan village were included in the study. Socio-demographic data, level of knowledge about mental disorders and caregivers burden were measured and observed.

Results: The socio-demographic variables show the average age of the respondents to be 50.0597, 57% of caregivers are women, as much as 100% caregiver Javanese, 37% of the caregivers are farmers, and 54% of these caregivers only have elementary school education. Total caregiver burden shows a mean of 23.28 (SD = 9.224). Findings on the level of burden of these caregivers revealed that 18 respondents were on the light burden level, the intermediate burden level had 4 respondents, while the level that did not experience any burden had 45 respondents. Caregiver burden was positively correlated with the age of caregivers (p = 0.000), employment of caregivers (p = 0.001), and level of education (p = 0.000).

Recommendation: Since these caregivers who care for people with mental disorders showed a higher financial burden compared with other types of caregiver burden, these findings suggest that a model of nursing intervention is needed to prevent the occurrence of a community-based caregiver load increase.

Keywords: Caregivers burden, mental illness, Paringan village, nursing.

Introduction

The increase in the prevalence of mental disorders will be followed by the need for additional caregivers who provide care in various homes¹. The ability of caregivers to provide care depends on the caregiver’s health status². However, it has been discovered that caregivers often neglect their physical and mental health, prioritizing the health of their patients. Consequently, chronic stress has been identified as the main risk factors of poor health state of most caregivers³. Interventions to reduce the severity will increase repair process and in turn improve the quality of life of patients a caregiver attends to⁴. A caregiver provides care for a spouse, parent, or his loved ones having chronic diseases such as mental disorders and the likes. Thus, understanding the function and presence of a caregiver mainly nurses at home is very important⁵.

An estimated number of 43.5 million Americans need the services of caregivers on a average of 19 hours per week⁶. In the United Kingdom, approximately 1% of the population are diagnosed with mental disorders⁷. Iran has about 7 million people suffering from mental disorders⁸. The prevalence of severe psychiatric disorders in Indonesia is at 1.7 per million; that is 1 to 2 people out of 1,000 inhabitants of Indonesia suffered severe mental disorders⁹. Caregiver burden is simply the perception that the caregiver has in relation to his/her physical health, social life, emotion and status, as a result of caring for a family member, resulting in the concept of burden as the product of a specific, subjective and
interpretive process of chronic disease. A high caregiver burden, if left untreated, will affect the caregiver’s life quality. And decrease in the quality of life of a caregiver will have a direct negative impact on the quality of care rendered to the patient with mental disorder.

Various problems caregivers face with patients/family members suffering from mental disorders include: 1) inability to understand the behavior of people with mental disorders, how to manage them, and their erratic behavior, making the caregiver helpless; 2) sadness, mental tension and loss of sense; 3) future concerns of sufferers and other family members; 4) financial problems. The family as a source of the most important supporters of patients with schizophrenia, which caused an increase in burden and responsibility. Caregiver burden negatively impact the families of patients with mental disorders. An estimated 50-90% of patients with chronic mental illness live with their families. The impact on family members of those who have mental disorders are so bad that it affects the lives of clients and caregivers, socially and work.

Method This study design was a descriptive cross-sectional study. A purposive sampling method was employed to obtain the needed sample which were 67 caregivers caring for people with mental disorders. Variables of the research include sociodemographic characteristics (age, gender, ethnicity, employment status, educational level) and caregivers’ burden. The research instrument employed is the modified version of Zarit Burden Interview (ZBI), which consists of five Likert-scale points with 22 questions. There are four sub-variables of caregiver burden which are mental burden, physical burden, the burden of social and financial burden. Each question has five points burden level and the criteria are: a score of 0 = never; a score of 1 = rarely; 2 = sometimes; 3 = rather often; and then 4 = almost always. Based on the total value of ZBI, there are four levels of burden: 1) score ≤21 = no burden; 2) score 21-40 = light; 3) score of 41-60 = moderate; 4) score 61-88 = weight.

Result

A total number of 67 caregivers who treated people with mental disorders participated in the study. The average age of the subjects was 50.0597, the youngest caregiver was 30 years old while the oldest was 69 years old. Majority of the 67 respondents were women. All these caregivers are from Javanese. of these 67 caregivers, 25 are farmers. And as many as 36 respondents have elementary education. The descriptive statistics for all the variables used are presented in Table 1.

Considering the correlation between the levels of burden with sociodemographic variables from the gender point of view shows that among the males, 4 respondents have medium burden level, 9 have a light burden level and 17 respondents did not experience any burden. Among the females, 9 respondents experienced light burden level while 28 respondents did not experience any burden. The result of Chi-square statistics test shows that there is a relationship between the burden level and gender (p = 0.49). While the burden level did not show any significant relationship with employment (p = 0.758) and education (0.087). The correlation of the Burden Levels of Caregivers and Sociodemographic Variables are presented in Table 3.

Discussion

This study shows the burden level of caregivers providing care for people with mental disorder. These burden experienced by the caregivers include the following: mental burden, physical burden, social burden, and financial burden. The results of this research showed that of the four types of burden, caregivers experienced only mental, physical, and financial burden (Table 2). And the correlation between the burden levels of caregivers and sociodemographic variables showed that these sociodemographic variables: age (p = 0.000), occupation (p = 0.001), and education (0.000) are related to the burden level (Table 3).

Mental Burden: The relationship between caregiver burden and age is significant (p = 0.000). Caregivers with age more than 51 years (51-70) are more likely to experience caregiver burden than those within 30 and 50 years. Caregiver with mental disorders had the feelings that despite having to care for patients with mental disorders with a vengeance, but still felt it should still be and need to do more to treat these patients. This simply means that these caregivers were experiencing mental burden.

Caregiver with less social support manifested an increase in the prevalence of burden experienced\[^12\]. Based on the length of treatment time caregivers give their patients, 32% had higher caregiver burden and 19% had lower caregiver burden\[^13\]. The level of burden experienced by these caregivers that treat people with mental disorders are in the mild and moderate region. Caregivers experiencing caregiver burden had the risk of experiencing depression\[^14\]. We can use the concept of family caregiver burden model to explain this, the family caregiver burden as an output is affected by the process of reciprocity in the variable coping, spiritual health, social support, and the quality of relationships, as antecedents a variable dependency needs activity daily living sufferers\[^15\].

Caregivers are not ashamed to care for people with mental disorders. As a matter of fact, they constantly care for people with mental disorders and rarely get angry. When the members of the family of the patient with mental disorder care for him or her properly, such person can recover in no time and the patient can experience a bright future with that stable condition. Caregivers implement an active communication process, and feel their privacy is not hampered in any way. Caregivers feel that with good care, activity daily living (ADL) of those suffering mental disorders would be good. ADL dependent increase in association with increase in the incidence of caregiver burden\[^11\]. The ability is always there to care for people with mental disorders. Caregivers while treating these patients need to provide enough emotional support and comfort\[^12\]. Even though mental disorders including chronic illnesses, comprehensive treatment, that is, balancing the biological, psychological, social, and spiritual treatment in accordance with the standard procedure then it will be discovered that the condition of people with mental disorders will be stable and the recovery process will be faster. Existing social support ranging from the members of the family, and friends who are also family members suffering from mental
disorders, as well as cognitive therapy from professional nurses will give these caregivers no trouble in seeking needed medical help. Caregivers who have strong spiritual beliefs always assume that the mental disorders experienced by members of his or her family are tests which must go and so they are not overwhelmed when it comes to giving them adequate care.

Physical Burden: Caregivers with mental disorders feel that since family members suffer from mental disorders and the condition are not stable, people with mental disorders more often ask the caregivers for help at every point and more rely on the caregiver. All these in a way have various physical impacts on the caregivers and these include: inadequate sleep or sleep disturbances, feeling more tired, and body aches just to mention few.

Caregiver Burden also result in the loss of weight of the caregiver. Nevertheless, caregivers with the profession of civil servants, as well as the private sector are able to manage their time properly as they can divide their time between when to care for people with mental disorders and when to take care of other activities, including time for themselves like resting.

Financial Burden: The various jobs of these caregivers are: 1) civil servant; 2) private; 3) farmers; 4) IRT. And statistically, the incidence of burden caregivers was related to the caregivers job ($p = 0.001$). Caregivers who care for people with mental disorders for a long period of time experience lack or insufficient funds to support and cater for the cost incurred while taking care of these people with mental disorders. In addition to being used for financing the daily needs of the patients, daily activities involving finance in the life of the caregivers are also affected as there are no adequate funds.

If assessed economically, it is seen that caregivers treat patients with chronic illness beyond the care of patients in health care facilities. The cohort study shows that caregivers treat dementia for $56,290 per year for each patient, which is far beyond what the patients can afford considering their conditions. Caregivers with peasant work, when compared to other better professions, experience more financial burden. The community where the research was carried out is a community in which the majority of the caregivers are farmers by profession. And the major way of carrying out their farming activities is through the traditional ways and they rely mainly on legumes. Even if they harvest for four months, it is not enough to compensate for the needs of caregiving.

Limitation: Several limitations were required in this study which assist in interpreting the results. These are: 1) the research was only conducted on a small area, so it could not be generalized; 2) the subjects of this research are caregivers with impaired psyche, without comparison.

Implication: When compared with a non-caregiver, the caregivers of patients with mental disorder indicate the existence of financial burden. The emergence of burden on the caregivers with those people with mental disorders will affect the caregivers capabilities in running the treatment of mental disorders, thereby affecting the behavior of caregivers towards discharging their duties adequately. This burden on these caregivers simply means that they need adequate intervention in order to cope and be effective in their primary duties.

Conclusion

In this particular study, considering the fact that the level of caregiver burden in the light region is 25%, as much as 5% at the level of moderate, and the majority, which is 70% of the caregivers are at the level in which they experience no burden, we can thereby conclude that the caregiver burden experienced by caregivers did not differ according to the patient’s status. The caregiver burden was positively correlated with the age of caregivers, employment of caregivers, and level of education.

Model of nursing interventions are required to prevent further escalation of community-based caregiver burden.

Organized Activities in Peer Groups Improve Mental and Social Well-Being in Adolescents: A Qualitative Study

Suharmanto¹,², Bagong Suyanto³, Windhu Purnomo⁴, Rahma Sugihartati³, Oedojo Soedirham⁴, Sutinah³

¹Doctoral Student, Department of Health Promotion and Behavior Science, Faculty of Public Health, Airlangga University, Surabaya, ²Lecturer at Medical Faculty, Universitas Lampung, Indonesia, ³Lecturer at The Faculty of Public Health, Airlangga University, Surabaya, ⁴Lecturer at The Faculty of Politic and Social Science, Airlangga University, Surabaya, Indonesia

Abstract

Introduction: Mental and social well-being in adolescents can be improved by organized activities in peer groups. This qualitative study aimed to explore organized activities in peer groups related to mental and social well-being in adolescents.

Method: Five focus groups were carried out with 30 adolescents aged 12–24 in Surabaya, Indonesia. Participants were purposively selected and had all experienced organized activities. A thematic approach was used for analysis and data collection was completed at the point of data saturation.

Results: Four interconnected themes emerged from the data; (a) self-esteem and self-regulation, (b) resilience, hardiness and mental toughness, (c) social adjustment and (d) social support in organized activities. Adolescents who involve in sports, arts, and clubs have high confidence, easiness to control their emotion, stronger in facing various problems. They also felt more adapt, respect, tolerant of others and get social support.

Conclusions: This study demonstrates that organized activities in peer groups improve mental and social well-being. Adolescents can have good self-esteem, self-regulation, resilience, hardiness and mental toughness. Adolescents also can have good social adjustment and social support. One of the efforts to prevent a mental and social problem is early recognition or detection in adolescents.

Keywords: Organized activities, peer groups, mental and social well-being, adolescents, qualitative research, focus groups.

Introduction

Mental and social health is one of the health problems in the world, including in Indonesia. One population that has a risk for mental and social health disorders is adolescents. Mental disorders in adolescents include anxiety and depression, while social disorders that occur are social isolation and loneliness.¹

Adolescence is a transitional period of development between childhood and adulthood. The development of adolescent social life is characterized by the influence of peers in adolescent life.² Peer groups are a place for adolescents to socialize with peers and they gain social support.³,⁴,⁵ Activities undertaken by adolescents with peers include activities such as sports, arts and clubs and impact on social and mental well-being.²

World Health Organization states that health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.⁷ Mental health is a state of well-being in which every individual realizes his or her own potential, can work productively and able to make a contribution to the community. A social well-being manifests if one is able to relate to another person or group well.
Criteria of mental well-being as follows mental efficiency, control and integration of motives, control of conflicts and frustrations, positive and healthy feelings and emotions, the tranquility of peace of mind, healthy attitudes, healthy self-concepts, adequate ego identity and adequate relation to reality. Mental well-being enhances our cognitive process, and to deal with simple as well as complex task. It also helps us in developing intrinsic motivation.

Social well-being concerned with social support and interpersonal relationship. Social support was simultaneously related with health and personal control beliefs in relation to well-being. Close support figure can be sufficient to promote well-being. The high social well-being is a positive significance in coping with the stresses of life and developed high productivity to make an effective community. One factor that related to well-being among adolescents was organized activities involvement.

The purpose of this study is to explore organized activities in peer groups related to mental and social well-being in adolescents.

Materials and Method

Study design: This study used qualitative description as a design and focus group for information gathering to explore organized activities in peer groups related to mental and social well-being in adolescents. This study chose focus groups because this method possible to acquire valuable data. Ethical approval was granted by The Faculty of Public Health Airlangga University Health Research Ethics Committee (No: 69-KEPK).

Recruitment process: Participants were male and female students who attend organizations in schools with peer groups. We used a purposive sampling technique, aiming to be inclusive of experiences of boys and girls from diverse backgrounds. Recruitment ended once theoretical saturation was achieved. In total, 30 adolescents ranging in age from 12 and 21 years, 12 participants were girls (40%) and 18 (60%) were boys.

Conduct of focus groups: Data collection was carried out by the main researcher from January-December 2017. Focus group were conducted with pupils in same year group to get naturalistic discussions. We designed a questioning route informed by existing mental and social well-being literature and guidance on focus groups. Focus groups lasted 50-60 minutes and were digitally audio recorded. The researcher assistant took field notes including verbal and non-verbal communication. Audio recordings were transcribed verbatim.

Data analysis: All data emerging from interviews and field notes helped inform the data-analysis process, were reviewed and coded by the researcher. This study using a thematic analysis approach. Pupils were given the opportunity to feedback on results to encourage participation validation.

Results

Five focus groups were conducted in this study with 30 participants. Four interconnected themes emerged from the data; (a) self-esteem and self-regulation, (b) resilience, hardiness and mental toughness, (c) social adjustment and (d) social support in organized activities.

Self-esteem and self-regulation along join an organized activities: Participants reported about self-esteem and self-regulation along join an organized activity in peer groups. Self-esteem and self-regulation are part of mental well-being.

Pupil A.2: “I feel more confident after meeting peer groups because they always support positive things I do like sports and arts activities.”

Pupil B.3: “I feel valuable when with them because I am more recognized in the group if I follow the activities of peer groups.”

Pupil C.15: “Before I joined the peer groups, I had difficulty controlling the behavior, but after joining the peer groups, I found it easier to control my behavior for the better.”

Participants felt more confident and valuable after following organized activities in peer groups. They can control behavior after joining organized activities. It can be concluded that adolescents have higher self-esteem and self-regulation than before following peer groups activities.

Resilience, hardiness and mental toughness in organized activities

Participants also reported about resilience, hardiness and mental toughness in peer groups activities. Mental well-being in adolescents can be identified by resilience, hardiness, and mental toughness.
Pupil E.19: “I become easier to control feelings of anxiety and stress, after joining the peer groups because we always discuss the problem of group members and find the solution.”

Pupil A.2: “I feel stronger in facing various problems both at school and at home because there is a place to store and solve the problem that is peer groups activities.”

Pupil D.13: “After I attended peer groups activities, I was more able to control my emotions, especially control anger, because my friend reminded me of a patience.”

Participants reported that they felt easier to control their feelings of anxiety and stress than before joining organized activities. They also reported that they felt stronger in facing various problems and easy to control their emotions. It can be concluded that adolescents have better resilience, hardiness, and mental toughness after following peer groups activities.

Social adjustment in organized activities: Interviews related to a social adjustment in peer groups activities, participants reported that they have a good social adjustment along following organized activities in peer groups.

Pupil D.27: “I am more able to adapt and respect others since I join this activity (study club, sports).”

Pupil C.8: “I am more tolerant of my friends in peer groups activity because they come from various backgrounds, such as different in tribe and religion.”

Participants said that they feel more adept, respect and tolerant with others since joining organized activities. This study can be concluded that adolescents have a good social adjustment with the following peer groups activities.

Social support from peers: Participants reported that they get social support from peers along following peer groups activities.

Pupil 3: “My friends give me attention and support if I have a problem, and she/he always help me to solve my problem.”

It can be concluded that adolescents get social support from peers in peer groups activities. This social support important for them to help solve a problem.

Discussion

This qualitative study used focus groups to provide a naturalistic setting in which to explore organized activities in peer groups related to mental and social well-being in adolescents. This study has shown that organized activities (sports, arts, clubs) has consistently been associated with well-being. Mental well-being in the adolescent can be identified by self-esteem and self-regulation. Self-esteem is an individual’s judgment of self-respect. Self-esteem contributes in healthy functioning. There is an association between organized peer groups activities and high self-esteem. High self-esteem has been linked to mental and social health outcomes. Lower externalizing and internalizing problems as well as increased self-regulation, social skills and academic performance. Someone who participated in organized activities demonstrated significantly higher self-regulation. Self-regulation contributes to social and mental well-being. Self-regulation promotes harmonious interactions with others and poor self-regulation can contribute to crime and health risk behavior.

This study has shown that adolescents have a good resilience, hardiness, and mental toughness after following organized activities in peer groups. Resilience is the ability to adapt in life and related to health. School connectedness may provide a role in promoting resilience for mental health for adolescents. Resilience was positively associated with psychological well-being and negatively associated with psychological distress, depression and anxiety. Hardiness is a personality style characterized by a commitment, control, and perception of problems as a challenge. High hardiness is associated with lower psychological distress, higher quality of life and a high level of mental health. Hardiness is a psychological style associated with resilience, mental and social well-being. Hardiness was negatively correlated with physiological responses of systolic blood pressure, diastolic blood pressure, and respiratory rate. Resilience and hardiness were positively associated with psychological well-being, and negatively associated with psychological distress. Mental toughness was a multi-dimensional construct and positively correlated with mental and social well-being.

This study also has shown that adolescents have a good social adjustment with following organized activities in peer groups. Self-adjustment is the harmony between individuals and the environment in which individuals
can interact, socialize and behave appropriately with the environment. There is a relationship between social adjustment and social well-being. Organized activities have consistently been associated with adjustment and well-being.

This study has shown that adolescents get a social support in peer groups activities. Peer interactions play an important role and related to social support. Organized activities involvement related to social support and adolescent wellbeing. Organized activities have consistently been associated with adjustment and well-being.

Conclusions

This study has shown that organized activities in peer groups improve mental and social well-being. Adolescents who involve in sports, arts, and clubs have high confidence, easiness to control their emotion, stronger in facing various problems. They also felt more adapt, respect, tolerant of others and get social support. Adolescents can have good self-esteem, self-regulation, resilience, hardiness and mental toughness. Adolescents also can have good social adjustment and social support. One of the efforts to prevent a mental and social problem is early recognition or detection in adolescents.

The Effect of Psychosocial Stimulation Assistance, Child Feeding and Children Health Care to Growth, Motor Development and the Decrease Frequency of Upper Respiratory Tract Infections for Stunting Children 2-3 Years of Age

Sukmawati\textsuperscript{1,2}, Bambang Wirjatmadi\textsuperscript{3}, Merryana Adriani\textsuperscript{3}, Shrimarti Rukmini Devy\textsuperscript{4}

\textsuperscript{1} Doctoral Candidate of Health Sciences, Faculty of Public Health, Airlangga University, Indonesia, \textsuperscript{2} Department of Nutrition, Makassar of Health Polytechnic, Indonesia, \textsuperscript{3} Department of Nutrition, Faculty of Public Health, Airlangga University, Indonesia, \textsuperscript{4} Department of Health Promotion, Faculty of Public Health, Airlangga University, Indonesia

Abstract

\textbf{Background}: Basic Health Research 2018 showed that the prevalence of national stunting is still high at 30.8%. That is, the growth problem suffered by around 8.9 million Indonesian children, or one in three Indonesian children.

\textbf{Objective}: to explain the effect of psychosocial stimulation, child feeding assistance and child health care on growth, motor development and prevention of respiratory infections over Stunting under-fives aged 2-3 years.

\textbf{Method}: Experimental research, consists of two stages. The first stage is the in-depth interview method. The results of the first phase of the study form the basis for the making of psychosocial modules. The second stage is intervention, namely the implementation of modules in the field. The sample was stunting children aged 2-3 years, the sample size was 30 children consists of 15 children as a intervention group and 15 children in the control group. Statistical analysis used was the T test and the Man-Whitney test at 95% confidence.

\textbf{New Results}: Psychosocial stimulation interventions, child feeding assistance and child health care influenced the increase in height, weight, head circumference, gross motoric, smooth motor, frequency of Upper Respiratory Tract Infection in stunting children, and statistically significant influence, except the variable weight.

\textbf{Conclusion}: Psychosocial stimulation interventions, child feeding assistance and child health care affect the increase in height, weight, head circumference, gross motor, fine motor, frequency of Upper Respiratory Tract Infection in stunting children.

\textbf{Keywords}: Psychosocial stimulation, stunting, children aged 2-3 years.

Introduction

Basic Health Research 2018 noted the prevalence of stunting is still high national 30.8% in 2013 i.e. 37.2%. That is, not the maximum growth of about 8.9 million suffered by the children of Indonesia, or one of the three children of Indonesia. The prevalence of stunting in Indonesia are higher than other countries in Southeast Asia, such as Viet Nam (23%), and Thailand (16%).\textsuperscript{1,2}
The Results of The Monitoring Status of nutrition in the last three years shows the percentage of children child renstunting, the year 2015, 2016 and 2017 in South Sulawesi was 34.1%, 35.6% and 34.8%. It takes an effort to prevent the bad impact of stuntingin children, so can be prevented it goes either physical or psychosocial.3

Stunting is finally becoming a public health problem in Indonesia because of the direct impact and also the long-term impact on the development of human resources. Prevent and cope with the impact of the problem of stunting is important and urgent is done considering the breadth and magnitude of the problem is always increased every year. Approach based on the framework of the concept of perbaikian nutrition in Indonesia is the approach towards improvements to access food intake and improvement approach against access decreased chance of infectious diseases. 2,4

Based on the results of the research Walker, demonstrated that children are stunting can be intervened with a psychosocial approach and feeding of children as well as children’s health care to maximize the kognitifanya competence in the period the next life. Psychosocial approaches with mentoring that involves the mother as the primary responsible granting of stimulation in the form of play, the feeding of children, care of the health of child stunting will be examined in this study.5

The purpose of the research was explain the pengaruh mentoring stimulation of psychosocial, the feeding of children and children’s health care against increase in height, weight, head circumference, motor development, and a decrease in the frequency of diseases of upper respiratory tract infections child children stunting aged 2-3 years.

**Subjects and Method:** Types of research: Experiment with Architecture Randomized Pre Test Post Test Control Group Design. Research implemented in the area of employment Clinics Sudiang Kingdom City of Makassar.

Conducting research may 2018 until March 2019. Samplein the Researchitis the older children stunting 2-3 years of age andnotinita State of pain. A large sample of 30 children composed of 15 childrenas a group treatment given intervention mentoring psychosocial stimulation, the feeding of children, and the children’s health care, and 15 children as a control group not given the intervention. Mentoring is done 3 times a week for 6 months. The implementation of psychosocial stimulation in the form of play activity about 1 hour each time mentoring. Statistical analysis used was the T test and the Man-Whitney test at 95% confidence.

Data collection was performed before and after the intervention. Primary Datacollected is Height, Weight, head circumference, the frequency of upper respiratory tract infections disease (RESPIRATORY), intake of carbohydrates, protein and zinc, the characteristics of the children, and family characteristics. Height, weight, and Anthropometry measurements collected by the head circumference. Data intake of carbohydrates, protein, and zinc are obtained by using the method of food recall 2x24 hours.

The results of the T Independent test analysis before the intervention in the treatment and control group was (P = 0.79) meaning a homogeneous sample in terms of frequency of Infections incidence. The results of the T Independent test analysis after 6 months with the value (P = 0.00) of this value below (P = 0.05), meaning there is a significant incidence of the frequency of upper respiratory tract infections between the treatment group and the control group.

**Discussion**

In this study mentoring psychosocial stimulation, child feeding and child health care, effect on increase in height, weight gain, head circumference, crude motor, fine motor and decrease in infectious diseases of the tract Upper breathing. These results were backed by the results of previous research by Walker, the year 2005 in Jamaica, research with nutritional supplementation and psychosocial stimulation of the growth of 9-24 month-old stunting children as many as 129 samples randomly. The results of the study are psychosocial stimulation of the effect on height, weight and head circumference in children aged more than 12 months.5

Psychosocial stimulation assistance gives a positive response, increasing the activity of children’s motor movements. Children activities in the form of skipping activities are able to increase bone mass stimulate the growth of long bones. The pressure response to the more scientifically active bone has been proven that the regenerate bone is stimulated by the load pressure while playing, which stimulates the growth of long-bone epiphyses, further increasing the child’s height. On the other hand by playing, the child will be pleased to cause the child’s appetite increase, then will increase food intake.

Child health Care, able to lower the frequency of diseases of upper respiratory tract infections. In this study, with decreased frequency of upper respiratory tract infections causing the child’s immune system to increase and appetite for children to be good so that food intake increased, thereby improving the growth of height, weight and head circumference. These results provide strong support that zinc is important to suppress the incidence of infectious diseases.7 The results of the study8 that zinc and protein were able to lower the prevalence of infectious diseases.9

In fulfilling the cell needs of this mineral zinc in the serum binds with some of the more commonly known proteins with a protein that works in the growth and metabolism of all cells one of them stimulates the
growth of T cells holding Important role of thymus function. The thymus is where the T.T cell maturation is the cell where the Timulin produces. Timulin is the hormone needed for the formation of the immune system. Adequate intake of zinc and protein, the immune system in the body increases, the growth of height, weight, head circumference, and the development of crude motor and optimal fine motor.

Factors that make increased head circumference follow the growth of normal child head circumference because of the high integration process that occurs due to psychosocial stimulation. Stimulation is received and transmitted through the nerves to the brain and the spinalis cord, where those messages are analyzed, combined, compared to and coordinated by a process called integration. Once selected, the messages are forwarded by nerves to the muscles and glands of the body, causing the muscles to contract or relaxation. This process stimulates child brain growth and development. The growth of nerve fibers and branches, resulting in complex neural and brain tissues. Growth and development of the brain together with the growth of the skull bones protecting it.

Psychosocial stimulation in this study significantly affected the development of crude motor and fine motor. Psychosocial stimulation gives a positive response to the child’s motor movement. The study was backed by research conducted by Rahmini Sabariah, that if the head circumference increased then motor motion improved. In this study have been reported earlier that the head circumference increased so that it will directly increase the crude motor motion score and fine motor. Physical development is closely related to the child’s motor development. Motor is the progression of body movement control through coordinated activities between neural, muscular, brain, and spinal cord, Dynamic System Theory.

The conclusion of this research is, the treatment of psychosocial stimulation, child feeding and child health care affects increase in height, weight, head circumference, crude motor, fine motor and lower frequency of disease Upper respiratory tract infection.

Abstract

Background: Meaningful nurse-patient interaction is crucial to achieving better health outcomes. A nurse should understand the importance of tailored effective communication to understanding how each patient prefers to be treated. Nurse-patient interaction is a potential resource to promote hope, meaning and purpose in life, which results in harmony and healing environment. Previous studies have shown a variety of aspects of nurse-patient interaction, however the process of interaction have not been thoroughly investigated from the patients’ viewpoint. This qualitative study aimed to investigate patients’ perceptions of their interactions with nurses in the hospital wards.

Method: A phenomenological approach was undertaken in one public hospital in Indonesia. 10 participants were recruited from general wards by purposeful sampling method. The data were collected through observations of nurse-patient interaction, the ward atmosphere as well as the activities by semi-structured interviews. Transcripts were then examined and analyzed by Interpretive Phenomenological Analysis (IPA) approach.

Result: Three themes were extracted from data analysis including saying sorry for neglecting me, calming the atmosphere for nurses’ openness and feeling surrender to destiny.

Discussion and Conclusion: Based on the results, issues such nurses’ openness and positive atmosphere in the hospital wards are shown to be important in maintaining the best quality of nurse–patient interactions. Nurses should be aware of these factors during interactions with patients.

Keywords: Feeling of surrender, surrender, patients’ perception, interactions, nurses.
Personal beliefs, values, perceptions, expectations and personal expression and behavior was stated as factors that influence the development of trust between nurse-patient.\textsuperscript{2-4}

Nurse-patient relationship develops after several interactions in a relatively short period of time. Studies showed that patients believed the importance of nurse-patient relationship in their care. Being a genuine, being open and honest and also being present when they need them were considered as essential keys in sustaining the relationship. Patients stated that they need to feel valued, respected as individuals and should be treated as if they were humans. Social interaction between nurse-patient has been described as a therapeutic and intervention process to achieve health outcomes. In addition, the interactions should be developed based on mutual trust and respect, it was part of a cognitive and psychomotor process.\textsuperscript{5-6}

Patients’ centered care and patients’ experiences of using health services are current health issues. Improving high quality of patient care requires more than clinical skills, it requires a deep understanding patients’ experiences encompass the range of interactions that patients have with hospital. Effective social interactions are designed as opportunities to develop a strong connection, mutual trust and understanding in a relationship. There were two key factors in social interaction: ‘developing and maintaining relationships’ and ‘caring and motivational interactions’. Promoting these factors could promote a long-lasting relationship.\textsuperscript{7}

Previous studies have shown a variety of aspects of nurse-patient interaction, however the process of interaction have not been thoroughly investigated from the patients’ viewpoint. This qualitative study aimed to investigate patients’ perceptions of their interactions with nurses in the hospital wards.

**Material and Method**

A phenomenological approach was undertaken in one public hospital in Indonesia. 10 participants were recruited from general wards by purposeful sampling method. The data were collected through observations of nurse-patient interaction, the ward atmosphere as well as the activities by semi-structured interviews.

Open-ended questions allowed participants to share their experiences of interactions. It was started with opening questions, “How would you describe yourself as a person?”, “How many days have you been staying in this hospital?”, “How would you describe your interactions with nurses?”

Transcripts were then examined and analyzed by Interpretive Phenomenological Analysis (IPA) approach. Seven steps in IPA analysis: (1) Read and re-read the transcripts and pick up the messages, (2) Re-read the whole transcripts and examine prospective themes, (3) Pay attention to the emergent themes and create a link between themes and (4) Organize themes and interpret the meaning of themes.\textsuperscript{8-9}

**Findings:** Nurses are exposed to many challenges and issues in the workplace that may influence the quality of nursing care. Improving the outcome of nursing care based on the experiences of patients, we need to consider patients’ perception to the care they received in the wards. Three themes were extracted from data analysis including saying sorry for neglecting me, calming the atmosphere for nurses’ openness and feeling surrender to destiny.

**Saying sorry for neglecting me:** Patients stated that nurses ‘saying sorry for neglecting them’, it was developed from two sub-themes: ‘disregard patient concerns’ and ‘feel sorry for the missed care’. Patients felt that nurses sometimes missed response to call alarms, administer the medication, and assist in bathing. However, nurses also said they were sorry for prioritizing another patient. Patients stated that: ‘I haven’t taken a bath in three days’, ‘I have tried to call them to help me, yet they were so busy and came late’, ‘…..but, they said sorry for neglecting us, they were only trying to help another patient’, ‘They said to us, just be patient, we will help you later after another patient’, ‘They seem so busy…..but…somehow my family could not find them in nurses’ station’. Nurses are important human resources in determining the quality of care in the hospitals as well as the nature of health outcomes. More than half of
respondents felt that there were not enough nurses in the wards. Nurses also admit that they did not have enough time to properly care for their patients. Studies showed that insufficient staff or time to carry out their work directly influence the patient outcomes and increase the risk of patient safety. Yet, hospital management should improve the policies for dealing with missed nursing care and its consequences for patients, health providers and the hospital.10-11

Calming the atmosphere for nurses’ openness:
Hospital environment provide an effective stimulation and adequate support for healing capacity of patients, families, and health providers. Patients expressed that they have been trying to ‘calming the atmosphere for nurses’ openness’. This theme came from three sub-themes: ‘being humorous’, ‘being polite’ and ‘hoping openness’. They knew that nurses seemed so busy in the wards, thus they tried to create a calm atmosphere by being humorous individuals, being polite during interactions and hope that nurses will be more motivated to help them. Patients stated that: ‘We have tried to create a humour while we communicate with them, so they will feel relax’, ‘We have to be polite when we need help from nurses’, ‘We do that for their openness’, ‘We have to help them, so they also help us, yaaaa….by being humorous like this’. Humour played a significant role in developing nurse-patient relationships and supporting nurses to provide adequate treatment to patients and their families. It helps patients to make a strong connection with health providers, provide a continuum of care and mutual support.12-15

Feeling surrender to destiny: Patients explored the ‘feeling surrender to destiny’ which was developed from two sub-themes: ‘being restricted’ and ‘being surrendered’. Patients said that: ‘I felt like surrender… may be it is what we should get’, ‘This ward you know, it feels so hot, even we cannot bring any fan in the hospital’, ‘We cannot ask for further questions, they just said to us, just be patient in this hospital’, ‘You know, it’s just we have to feel like this….surrender…. what can we do, we are the one who need helps from them’, ‘Just be patient, that is all you need’. Being surrendered means as having no other options than to relent, this happened when patients could no longer help themselves during hospital stays. They rely on nurses for comfort, reassurance, advice, and support. Dependence on other people means that they trust others to help and manage the situation. During communication with nurses, patients have to be a cooperative person and doing as nurses requested. Nurses should also be present for their patients during the nursing shift, active listening and maintain a good eye contact while interacting with patients. A mutual trust and respect during interactions was developed when the patients were invited to take part in the nursing care.16-17

This study highlights the perspectives of patient during interaction with nurses. The results of this study may have implications for nurses to manage their care and improve their relationships to achieve high quality of patients’ outcomes.

Conclusion

Based on the results, issues such nurses’ openness and positive atmosphere in the hospital wards are shown to be important in maintaining the best quality of nurse–patient interactions. Nurses should be aware of these factors during interactions with patients.

Abstract

One of serious problems of health care is the high prevalence of congenital defects of a cardiovascular system. After carrying out operation at such children changes in a cardiovascular system, disturbances of their physical and psychological development often remain, there is a decrease in resistance of their organism. It is clear, that the will be more elaborately rehabilitation of such children, the higher at them chances of long, full-fledged life. The author’s technique of physical rehabilitation of such children was capable to provide more expressed positive effect, than traditionally applied at these patients. Against the background of use of an author’s technique there occurred optimization of the general functional condition of children and their tolerance to an exercise stress increased. At children is after passing of a course of author’s rehabilitation the functional condition of cardiovascular and respiratory systems reached the level of control. It exceeded effect in group of the children receiving traditional rehabilitation. Thus, the author’s technique of physical rehabilitation of the children who underwent an operation for heart disease is more effective, than the traditional scheme that it gives the grounds to recommend it for broad practical application.

Keywords: Rehabilitation, children’s age, heart diseases, physiology, tourism.

Introduction

One of the most important problems of health care is the high prevalence of congenital defects of a cardiovascular system. After carrying out operation at such children changes in a cardiovascular system, disturbances of their physical and psychological development often remain, there is a decrease in resistance of their organism. It is clear, that the will be more elaborately rehabilitation of such children, the higher at them chances of long, full-fledged life. The author’s technique of physical rehabilitation of such children was capable to provide more expressed positive effect, than traditionally applied at these patients. Against the background of use of an author’s technique there occurred optimization of the general functional condition of children and their tolerance to an exercise stress increased. At children is after passing of a course of author’s rehabilitation the functional condition of cardiovascular and respiratory systems reached the level of control. It exceeded effect in group of the children receiving traditional rehabilitation. Thus, the author’s technique of physical rehabilitation of the children who underwent an operation for heart disease is more effective, than the traditional scheme that it gives the grounds to recommend it for broad practical application.

In surgical treatment of congenital defects of a cardiovascular system at children serious success is achieved. At the same time, improvement of rehabilitation actions at the children operated concerning congenital heart diseases still needs improvement.

It becomes clear that an integrated approach is necessary for successful rehabilitation of children with heart diseases. Only the complex technique of rehabilitation allows to reduce consequences of congenital heart diseases and surgery, will help to prevent violations in development of children and will reduce risk of their invalidization.

Need of improvement of method of physical rehabilitation of children after surgical intervention concerning heart diseases sets for researchers tasks of assessment of efficiency of different options of
improvement at this disease. Admits that powerful improving potential in this plan improving tourism as a result of the strong optimizing action on an organism of walking and natural forces of nature has\textsuperscript{11,12}. Options of sports tourism traditionally are campaigns, excursions, walks, tourist meetings, competitions and local history activity. At the same time at all options of improving tourism physical activity has to increase gradually, reaching peak to the middle of the period of activity taking into account a land relief, the mass of equipment and speed of movement\textsuperscript{13,14}. The great improving value of tourist rest is also connected with powerful positive action on an organism of children of weather climatic conditions and a landscape\textsuperscript{15,16}. Considering the expressed improving opportunities of improving tourism, it was decided to estimate its influence on a cardiovascular system at the children who underwent an operation for congenital heart disease.

The work purpose - to develop a complex technique of physical rehabilitation of the children operated concerning heart disease and to estimate its efficiency.

**Materials and Method**

The conducted research is approved by local ethical committee of the Russian state social university on September 15, 2017 (Protocol No. 11). In researches 30 children, 18 boys and 12 girls with average age of 11.4±1.42 years took part. All of them were taken in a research in 6 months after operation for congenital heart disease – defect of an interatrial partition. At the time of capture in a research all children had normal indicators of ultrasound examination of heart and the electrocardiogram. 2 groups – the main and experimental on 14 and 16 people, respectively were in a random way created from them. The main group received traditional rehabilitation, the experimental group underwent rehabilitation by a technique with elements of recreational tourism. The group of control is provided by 20 clinically healthy children of the same age.

In experimental and control groups within 6 months the identical complex of exercise stresses was applied. It included the daily dosed walking, gradually increasing duration within a month from 30 minutes to 90 minutes, four times a week run, lasting from 5 minutes up to 15 minutes at free speed with gradual after 1 month of occupations, transition from jogs on the horizontal plane on jogs on the surface having the ascending bias no more than 30\textsuperscript{17,18}. In experimental group in addition once a week in 2 months of occupations until the end of observation group classes were given by recreational tourism. In cold season they were conducted at a temperature not below –10\textdegree C in the form of ski walks across the Moscow region on a distance not less than 2 km. During lack of snow cover pedestrian one-day campaigns across the territory of the Moscow region with a total length of 5 km were carried out. During ski or a hike the rest interval each 30 min. on the low-cross-country terrain and each 15-20 min. on rises in the conditions of the hilly area was observed\textsuperscript{19}.

The status of the children who made experimental group and the main group was evaluated daily. Their examination was conducted by the method given below dvoyekratno – when taking under observation and in its end. The group of control was inspected once.

For assessment of a functional status of cardiovascular and respiratory systems the heart rate and frequency of respiratory movements were evaluated\textsuperscript{20,21}. Also orthostatic test\textsuperscript{22}, Martin-Kushelevsky\textsuperscript{23} test, the Harvard step test\textsuperscript{24} and the tredmill-test were applied\textsuperscript{25}. Statistical data processing happened to the help of a t-student criterion.

**Results of a research:** Application of both options of physical rehabilitation provided comparable decrease in heart rate and frequency of respiratory movements to the level of control (table 1) in both groups.

The other considered indicators of a functional status of the children receiving rehabilitation according to the author’s program improved more in comparison with indicators of the children of the main group receiving a traditional technique of rehabilitation.

Conclusion

One of the most important problems of health care is the high prevalence of congenital defects of a cardiovascular system. After operation at such children changes in a cardiovascular system often remain that demands carrying out from them systematic rehabilitation actions. It is recognized that what will think more over rehabilitation of such child, that chances are higher at him to live long and full-fledged life. The author’s technique of physical rehabilitation with elements of tourism provided at the children operated concerning heart disease, more expressed effect, than traditionally applied at this contingent of patients. As a result of its application for children big optimization of the general functional state and higher tolerance to physical activity was reached. It becomes clear that the author’s technique of physical rehabilitation of the children who underwent an operation for congenital heart disease is more effective, than traditional that it gives the grounds widely to recommend it for practical application.

Relationship between Job Satisfaction with Employee’s Turnover Intention in Petrokimia Gresik Hospital

Candra Ferdian Handriyanto¹, Moh Badrus Sholeh¹, Nyoman Anita Damayanti²

¹Department of Health and Administration Policy, ²Public Health Faculty, Airlangga University

Abstract

During the 2016-2017 period, employee turnover rates at Petrokimia Gresik Hospital showed an increase, with figures of 12.54% in 2016 and 13.49% in 2017. Of the total employee turnover in 2017, 57% were types of labor medical and 96% are voluntary turnover. This is a serious problem, so it is important to do an analysis with the aim of knowing the causes and can develop solutions to anticipate the future so as not to continue to increase. This turnover can be predict by analyzing the tendency of employees to leave work, using turnover intention analysis. One of the factors causing high employee turnover is job satisfaction. This research is an observational quantitative study conducted at Petrokimia Gresik Hospital, with a total sample of 172, using primary data obtained directly from the employees of Petrokimia Gresik Hospital by simple random sampling (including medical, supporting, and administrative personnel). Data collection used a valid and reliable questionnaire, namely JSS (Cronbach’s Alpha 0.910) and Turnover intention scale of 6 items-TIS-6 (Cronbach’s Alpha 0.677). Data analyzed using the Spearman correlation test. The result of the Spearman correlation test is that there is a significant relationship between JSS and TIS-6 (p 0.000 <0.05) with a negative correlation direction (correlation coefficient -0.507). These results indicate that the higher the JSS value, the lower TIS-6 will be. The conclusion of this study is Job satisfaction is related to Turnover Intention on employees at Petrokimia Gresik Hospital.

Keywords: Job satisfaction, turnover intention.

Introduction

Turnover is defined as the movement of employees from their current job¹. Turnover is also defined as the cessation of a permanent working relationship between the company and its employees². Turnover can also be a separation between the company and the worker³, whereas Scott (1977) defines the symptoms of turnover as the transfer of labor from and to a company⁴. Mobley (1986) an expert in the issue of employee turnover gives a turnover limit as an individual stops from an organization accompanied by the provision of financial rewards by the organization concerned⁵. Turnover is the entry of labor into a company within a certain period of time⁶. If in a hospital the level of entry and exit of employees rises from before, this is an indication of a motivation, enthusiasm and passion for work. Beside that it will reduce productivity can also lead to the continuity of the running of a hospital and the amount of costs incurred during the process of employee recruitment, training, until the placement⁷.

The impact of turnover for organizations includes: (a) employee withdrawal costs, concerning the time and facilities for interviews in the selection. withdrawal and learning of changes. (b) training costs, involving the time of the supervisor, personnel department and trained employees. (c) what is issued to employees is smaller than that produced by the new employee. (d) the level of accidents and errors of new employees, usually tends to be high. (e) production lost during the employee turnover period. (f) production equipment that cannot be used fully. (g) a lot of waste due to new employees. (h) need to do overtime work, otherwise it will experience production delays. High turnover in the organization indicates the need to improve working conditions and how to develop it.
Mobley and Seashore, et al (1986) state that many factors cause employees to move from their workplaces but the determinant factors of desire to move include: (1) Job satisfaction, (2) Organizational commitment from employees. There have been various studies on job satisfaction and organizational commitment from employees, but in relation to employee turnover there is still little research. Based on the above background, the problem raised in this study is the increasing trend of employee turnover rate in Petrokimia Gresik Hospital in 2016-2017 by 12.54% - 13.49%, which is dominated by voluntary turnover (96%) and from the class of medical personnel (57%). Thus it is necessary to analyze turnover on employees and make efforts to overcome them.

**Method**

This research is a quantitative research using cross sectional design to determine the relationship between Job Satisfaction and Turnover Intention. The sample in this study were employees at Petrokimia Gresik Hospital, which consisted of 172 medical, supporting and administrative or general personnel. Employee participation in this research is voluntary. Health workers who are not employees (interns, guest doctors) are not included in the study.

Sampling in this study was carried out by simple random sampling for each type of hospital staff. The sample size is calculated using a formula and obtained a minimum number of samples of 172 people for the confidence value of p < 0.05 in the hospital employee population of 340 people.

Collecting data using a questionnaire that has been tested for validity and reliability. Independent variables namely Job Satisfaction are measured using a questionnaire adopted from JSS consisting of 9 dimensions, consisting of a total of 36 questions. The scale is 4 points Likert scale (4 = very satisfied, 1 = very dissatisfied). While the dependent variable is Turnover Intention measured using a questionnaire adopted from TIS-6 consisting of a total of 6 questions. The scale is 4 points Likert scale (4 = strongly agree, 1 = strongly disagree). The collected data processed and analyzed using the SPSS version 21.0 for Windows program. Descriptive analysis used to describe the characteristics of respondents, Job Satisfaction Scale, and Turnover Intention for employees at Petrokimia Gresik Hospital. The relationship between Job Satisfaction Scale and Turnover Intention analyzed using the Spearman correlation test.

**Results**

**Respondent Demographic Data:** The majority of respondents were women (59.3%), and young people aged 20-30 years (73.8%). Based on their marital status, 55.8% are married. Respondents who live in the Gresik area are more dominant (69.8%). Respondents with contract employee status were more than permanent employees (59.3%). The majority of respondents have a working period of less than 10 years, 90.7%, and 48.3% is 1-3 years. Respondents consisted of medical personnel (50%), supporters (29.1%), and administrative or general personnel (20.9%). Medical personnel who become respondents consist of doctors, nurses and midwives. Supporting staff consists of pharmacists, pharmacist assistants, laboratory analysts, radiographers, nutritionists, medical recorders, physical firepower, and environmental health workers. While administrative or general staff consists of cashier, lobby, finance, secretariat and personnel. The majority of respondents are executors (94.2%), with S1 education (44.2%), no children (57%), have a partner (husband or wife) who also work (44.2%) and have work experience in other places before (69.8%).

**Employee Job Satisfaction:** Variable Job Satisfaction is explained through 9 dimensions, namely salary, promotion, supervision, additional benefits, agreed rewards or rewards, operational conditions, co-workers, work and communication characteristics, with 36 questions submitted to health workers, but after passing validity test 31 just question.

The total JSS score is in the range 31-124. Descriptively, JSS categorized as being dissatisfied, less satisfied and very satisfied. The total score of respondents’ JSS as shown in table 1. It turns out that the majority of JSS data is not satisfied (86.6%) then very satisfied (11%) and dissatisfied (2.3%). Dissatisfied perceptions of health workers who were categorized as unsatisfied (n = 149) towards each dimension of JSS are shown in table 2. Respondents who answered dissatisfied were related to the dimensions of salary (37.6%), operational conditions (28.2%), promotion (22.1%), additional profits (20.1%), agreed rewards (17.4%), communication (10.7%), supervision and co-workers (6.7%), as well as the nature of work (1.3%).

Employee Turnover Intention: The majority of Gresik Petrochemical Hospital employees turnover intention is high (47.1%). This is shown in table 3. Based on the demographics of the respondents, a comparison of the average turnover intention score was used by using mannwhitney test and kruskalwallis test, with the results shown in table 4. There were significant turnover intention differences on variables of children, education and partners work with a value of $p < 0.05$. The S1 education group has the highest average turnover intention (97.14) compared to other education groups ($p = 0.034$). Respondents who do not have children have a higher average turnover intention (94.96) than those who have children ($p = 0.010$). Employees who do not have a working partner have higher turnover intention (93.28) than employees who have a working partner or do not work ($p = 0.025$). Meanwhile, there were insignificant differences in the variables of gender, age, occupation, length of employment, employment status, position, place of residence, marital status, and work experience.

Relationship between Job Satisfaction and Turnover Intention of Employees The results of the JSS questionnaire are scored and sum up, as well as the TIS-6 score. Because the result of normality test is TIS-6 distribution was not normal, then the relationship between JSS and TIS-6 was analyzed using Spearman correlation test. The test results are shown in table 5. The results of statistical tests show that there is a significant relationship between JSS and TIS-6 with a $p$ value of 0.000 ($<0.05$). The correlation direction is negative (correlation coefficient -0.507), which means the higher the JSS, the lower the TIS-6.

Discussion

From the results of the study, it appears that JSS employees at Petrokimia Gresik Hospital showed only a small number of dissatisfied categories (2.3%). Even so, it turns out that there are several dimensions that are dissatisfied that require attention. This is because there are categories of JSS that are not satisfied with the large number (86.6%) and those who are very satisfied (11%), of course the less satisfied category can later move to a dissatisfied category. Organizational factors that can be analyze are regarding organizational policies and recruitment. Organizational policy and recruitment were measured using the dimensions of operational conditions within the JSS where 28.2% of respondents said they were not satisfied. The reason is that organizational policies often change, causing employees to experience confusion in work, as well as a recruitment process that has not been balanced with sufficient orientation.
Then from the reward factor, this is measured using the salary dimension, additional benefits and agreed rewards. Regarding salaries, the causes of dissatisfaction factors include the difference in salary between several insignificant occupational classes, for example S1 contract nurses who are in work class 8, only <100,000 IDR, - from contract administration officers of DIII graduates who are in grade 9.

Then the reward system that has not been owned, causing employees to feel dissatisfied in showing their achievements. In career development factors, this is measured by the dimensions of promotion, the factor that causes is the opportunity to get a promotion or career path requires a long time. In the job design factor, the dimensions used are the nature of the work, the contributing factor is that workload analysis has never been carried out, while employees feel that the work to be done at work is very large, the personnel division does not have a human resource research program related to workload. From the literature states that turnover that occurs in employees will lead to reduced workforce, which then affects morally, and cause stress from employees who are still left because there is an increase in workload. Then it is related to the work affiliation factor, here is measured by the dimensions of co-workers. Frequent employee turnover due to high turnover causes employees to often adapt again to their co-workers. This can hamper performance. From the supervision factor, it is measured by the dimensions of supervision. In the implementation of supervision, it is still rarely carried out. This is due to the large number of concurrent positions and tasks that occur in management, especially since there has never been a workload analysis and work design evaluation by personnel. The leadership factor can be measured by the dimensions of communication. There is often an inability of superiors to communicate well to subordinates, and there is a culture of blaming management.

**Conclusion**

Based on the results of the analysis and discussion of the relationship between JSS and TIS-6 for health workers at the Petrokimia Gresik Hospital, the following conclusions were obtained.

1. JSS employees at Petrokimia Gresik Hospital obtained JSS data, the majority were less satisfied. The majority of respondents in the unsatisfied category who answered dissatisfied were related to the dimensions of salary and operational. Need to follow up to improve the factors that are considered as lacking factors in the organization.
2. The majority employees have turnover intention from Petrokimia Gresik Hospital. The Bachelor degree education group has the highest average turnover intention compared to other education groups. Respondents who do not have children have a higher average turnover intention than those who have children. Employees who do not have a working partner have higher turnover intention than employees who have a working partner or do not work.
3. The results of statistical tests show that there is a significant relationship between JSS and TIS-6. The correlation direction is negative, which means the higher the JSS, the lower the TIS-6.

The Effect of Exercise on Activity Daily Livings and Happiness Level amongst the Elderly Population in Thailand

Chomlak Kongart¹, Yuttachai Likitjaroen², Surasak Taneepanichskul¹

¹College of Public Health Sciences, Chulalongkorn University, Phayathai Road, ²Department of Neurology, Faculty of Medicine, Chulalongkorn Hospital, Rama IV Road, Pathumwan, Bangkok, Thailand

Abstract

Objective: The purpose of this research was to study whether exercise affected the practice of daily activities of the elderly population and their happiness levels.

Method: A sample of 35,896 elderly individuals were taken nationwide, consisting of those aged 60 years and older who were in the 2014 Statistical Database at the National Statistical Office (NSO).

Results: The results of the chi-square test was used to analyze the relationship between the daily activities of the elderly population that affected their exercise abilities. In addition, it was discovered that their activities of daily living and their happiness level correlated significantly with regular exercise ($p$-value < 0.05).

Conclusion: This research found that the practice of daily activities by the elderly population and its associated happiness, affected their exercise ability. Therefore, the elderly should be encouraged to exercise so as to relieve stress and stimulate their normal performance of routine activities.

Keywords: Exercise, happiness level, activity daily living, ADL, Thai elderly.

Introduction

Most major problems of senior citizens are often related to their health. This is mainly due to the effect of bodily changes over the functioning of organs.¹ Some examples include reduced endurance, agility and strength as well as inferior performances of daily activities due to a higher rate of deteriorated fitness from aging.² Without proper health rehabilitation, the elderly may suffer chronic illnesses and less physical fitness.³ Hence, the elderly population should recognize the importance of exercises in order to live a quality aging life.⁴

Exercise promotes health and physical performances while slowing bodily decay.⁵ In addition, exercising also increases the physical abilities of the elderly as they are able to maintain the effectiveness of muscular strength, relieve tension and stimulate the lung muscles. Interventions that include moderate physical activity levels with high mental, physical, and social demands may produce the greatest benefits on ADL physical performance. Furthermore, exercise can help the elderly in focusing, decreasing their anxiety and allowing them to experience positive emotions.

The determinants of happiness is mainly associated with factors such as socio-economic status, marital status, mental health etc. In addition, fundamental components of happiness such as health, family, community, and economic equity have been noted by researchers in Thailand.⁶ Furthermore, the key planning body in Thailand, the National Economic and Social Development Board, has recently adopted the Gross National Happiness concept for a more holistic path to health and development which is termed as the Green and Happiness Index (GHI) of Thailand.⁷

Recently, it has been reported that Thailand ranked no. 46 out of 156 countries in the world in terms of...
happiness levels as indicated by the World Happiness Report 2018.\(^8\) Population Ageing is now recognized as a 21\(^{st}\) century phenomenon affecting all countries around the globe. It was estimated that the population of Thai individuals aged 60 years and over will reach over 17 million by the year 2030.\(^9\) Hence, the happiness of the elderly population may be significant for the future of the country.

Therefore, this research aims to show how the practice of daily activities amongst the elderly population and their happiness level can be affected by exercise. The results obtained in this research will be further used to design appropriate exercise patterns for the elderly which can help them in maintaining their happiness levels.

**Materials and Method**

**Design and Instruments:** This research utilized a descriptive study design in the form of survey in order to evaluate the characteristics of healthy ageing among the elderly population aged \(> 60\) years in Thailand. With a survey of 35,896 elderly individuals nationwide in 2014, the report was taken from the database of the National Statistical Office (NSO).\(^{10}\) SPSS version 17 (IBM, USA) was used for all data analyses and \(p\)-values \(< 0.05\) were considered statistically significant.

**Activities of Daily Living (ADLs):** The Activities of Daily Living (ADLs) are a set of basic tasks necessary for completing fundamental physical needs on a day to day basis such as, movement in bed (being able to sit, rise and move around in bed), transfers (shifting from one place to another in a small distance), locomotion (walking around), dressing, personal hygiene, and feeding.\(^{11}\) This scale was derived from two classical instruments, the Lawton Scale\(^{12}\) and the Barthel Index\(^{13}\).

**Happiness level:** Happiness is an emotional or effective state that is characterized by feelings of enjoyment and satisfaction. In the instance of aging, happiness is often equated with morale, contentment, well-being, life satisfaction, successful aging, quality of life, and having “the good life”.\(^{14}\) The scale used to measure happiness levels in this study is adapted from the study above and refers to the self-reported feeling at the time of the survey with an eleven-point scale (0-10). The following scales of measurement were used to evaluate the meaning of the results: 0 means being “unhappiest,” 5 means being “not unhappy and not happy,” and 10 means being “happiest.” In addition, the participants were asked to provide information on whether they exercised “never”, “sometimes” or “regularly”.

**Data Analysis:** The data obtained from the survey was analyzed in the form of descriptive statistics such as frequency distributions and percentage. In addition, the effects of exercise on the activity ADLs and happiness levels among the elderly population in Thailand were also determined using the chi-squared test.

**Results**

**Demographics:** This retrospective study was conducted in the form of a survey obtained from the NSO. The total number of the elderly population aged \(> 60\) years surveyed were 35,896 individuals from all provinces in Thailand. Table 1 shows the demographic profiles of the participants where 20,034 (55.8\%) were female and 15,862 (44.2\%) were male. In addition, most of the participants were Buddhists (95.6\%) followed by Muslims (3.6\%) and Christians (0.7\%). Furthermore, most of the participants were married (61.8\%) followed by those that were widowed, divorced or separated (34.1\%) and those that were single (4.1\%).

</table>

**Activities of Daily Living (ADLs):** The ADLs represent a set of tasks that can be accomplished by an individual without any assistance. Results show that elderly who exercised regularly 17,614 (65.6\%) had clear visibility without glasses/lens \((p\)-value \(< 0.05)\). In addition, elderly individuals undergoing regular exercise had a better hearing ability without a hearing aid instrument, the ability to restrain urinating and could constrain their defecation in 25,272 (94.1\%), 24,002 (89.5\%) and 24,358 (90.8\%), respectively \((p\)-value \(< 0.05)\).
Furthermore, regular exercise was also seen to be beneficial in terms of elderly individuals not contracting illnesses, could eat by themselves and had the ability to take routine medicine correctly and completely by one selves, as much as 22,694 (84.5%), 26,794 (99.7%) and 26,502 (98.6%), respectively (\textit{p-value} < 0.05).

Similarly, the ability to lift 5kgs of weight by themselves, to walk 200-300 meters, climb 2-3 flights of stairs, get on/off the bus and count change was significantly increased in those elderly individuals that exercised regularly (24,510 (91.2%), 25,917 (96.5%), 26,016 (96.8%), 24,962 (92.9%) and 26,541(98.8%), respectively) in comparison to those who never exercise.

**Happiness level:** According to Table 2, the total number of participants that have never exercise was 13,041. Out of those, only 43 (0.3%) self acclamined themselves as being unhappy while most of the people who sometimes exercised (0.1%) and regularly exercised (0.1%) were less unhappy in comparison. The tread of happiness was seen to increase from unhappy (level 0) to happiest (level 10) in all the categories of physical exercise. However, the happiness level was still the highest for those that exercised regularly with peak happiness seen at level 8 with 3415(26.2%), 9197 (35%) and 8476 (36.2%) in those that never, sometimes and regularly exercised, respectively with a significant \textit{p-value} < 0.05

**Discussion**

Through this study, we were able to establish the positive effect of exercise for elderly populations. The ability to conduct their ADLs was seen to significantly increase with those individuals that exercised regularly in comparison to those that never exercise (\textit{p-value}<0.05).

A study on the development of exercise innovation was conducted in Nakhon Si Thammarat.(15) The results showed that 96%, 2.75% and 1.25% of those surveyed were social-bound, home-bound and bed-bound, respectively. Upon implementation of an 8 weeks exercise regimen which included lifting a pulley, arm swinging, pulling of resistance bands, pedal exercise and kicking in the air for a period of 30 minutes, the authors noted that, the elderly could significantly conduct their ADLs better as compared to before the exercise routine with (\textit{p-value} of < 0.01).

Recently, Jafari and Behboodi(16) evaluated the effect of aerobic exercise on reducing lonliness and promoting happiness in 30 elderly individuals. The results showed that aerobic exercise could significantly reduce lonliness and happiness of elderly individuals (\textit{p-value}< 0.01). Similarly, Suwanrada(17) investigated factors affecting the happiness level of 4,036 elderly population in Kanchanaburi province of Thailand. The author observed that the three main factors which contributed significantly to the happiness level of the elderly were perceived trust in family, the number of people with whom it is pleasant to talk and their perceived health. The research also found that the elderly’s ADLs and the happiness affected their exercise. Therefore, they should be encouraged to exercise for relieving stress and stimulating their normal performance of routine activities.

**Conclusion**

The survey conducted herein has provided evidence that the elderly population need some form of physical activity in their life as their happiness level is affected. ADLs are also improved in those who exercise regularly and sometimes as compared to those that do not exercise. Thus, the elderly population should be encouraged to work out in the form of walking or a routine exercise regimen suited to their lifestyle and needs. This practice could also help in slowing their ageing process and the early onset of cognitive illnesses such as Alzheimer’s.

**Conflict of Interest:** The authors declare that there are no conflicts of interest.

Assessment of Pre and Post Training Nursing Documentation Program for Nurses in Accident and Emergency Hospital

Delan J. Qader¹, Faruk H. Faraj²

¹Department of Adult Nursing, College of Nursing, ²Department of Surgery, College of Medicine, University of Sulaimani, Kurdistan Region, Iraq

Abstract

The study aimed to assess nursing care record tools in the Accident and Emergency Hospitals. A quasi-experimental study was carried out recently by using quantitative design for measuring the effectiveness of the program and new tool documentation. Sixty-five nurses participated and were selected from the hospital along with Nurses from other hospitals as control group to collect data using a self-questionnaire. The result was almost 75.29% and 24.71%. The shortcomings remain undocumented due to the barriers.

Keywords: Nursing record tool, nursing practice, documentation program.

Introduction

Nursing documentation is referred to design nursing care that offered to patients by qualified nurses and also used for the purpose of quality assurance. Although conformable advice from quality-improvement programs and professionals are employed for a long time, the health profession has still faced the problem of earning and maintaining applicable standards of clinical documentation.

Keeping the patients’ clinical records is considered as one of the most critical functions of nurses; however, there are no universal rules and standards for saving individual records. Thus, documentations can be completed accurately to solve this problem in which qualified nurses have been trained well about the rules of charting, while the style and frequency are generally left to facility and institution to impose.

Therefore, the aim of the present study was to improve nursing care documentation, check the acceptability of new tools after documentation program, and assess documentation barriers in hospitals of Sulaimani City.

Materials and Method

Designing and setting of the study: A quasi-experimental study was carried out from June 2016 to November 2017 using a quantitative design in order to measure the effectiveness of a documentation program and the acceptability of a documentation tool. Two groups and a pretest-posttest design were used in the evaluation section. The study was conducted on experimental groups of nurses that working in the Accident and Emergency (A & E) Hospital and those working in maternity, surgical, medical, and oncology hospitals as the control group. Accordingly, 130 nurses working in inpatient wards at hospitals of Sulaimani have recruited the study sample.

Study Instruments: For the purpose of the present study, the questionnaire consisted of 3 sections. The first section was Socio-demographic data which included 11 items. The second section was information related to satisfaction with the recording tool that consists of 10 items measured by a 5-point Likert scale. The level of acceptability of the nursing care documentation was measured using 10 questions with their responses. Simultaneously, the level of knowledge was collected and grouped into two planes of good documentation of nursing care practice for a score greater than or equal to the mean and poor documentation of nursing care practice for a score smaller than the mean.

Data collection: To facilitate data collection, assessment and interviewing were utilized as the data collection method. For the experimental data, collecting
and assessment (the pre-test) were carried out in the A & E Hospital. Pre- and post-tests were conducted for the control group in similar hospitals. Data collection from both groups was held. The data were collected by utilizing an adapted and constructed standardized questionnaire through interviewing technique. The nurses completed the structured questionnaires which were administered at two times; once 3 months before the program and then 3 months after the program.

The documentation program: A documentation program was constructed and oriented with the right documentation to the nurses by the researcher toward improving recording tool. The program was generated based on Trauma nursing care flow sheet (extensive review of the literature and relevant previous studies), which are basic and advanced trauma live support (BLS)\(^4\); 1 week of training course and Nursing process and how to do the right documentation with a new tool in the A and E Hospital: 1 day of training course.

Data analysis: The data were analyzed using the Statistical Package for the Social Sciences (SPSS) version (22.0). Different statistical instruments were used in order to achieve the objectives of the study.

Results

Table 1 indicates that there are no significant associations between the experimental and control groups in terms of their demographic characteristics. There was no statistically significant difference between the two groups regarding their demographic variables (P>0.05) while table 2 indicates that the acceptability of the new documentation tool was good (75.3%) and bad (2.2%) in the experimental group.

About the documentation acceptability of nursing practice regarding the place of work, table 4 reveals that both Accident and Emergency and oncology had good documentation, while other hospitals had bad nursing documentation, and there was a highly significant difference between working place and accepted nursing documentation practice.

Discussion

As indicated in this study, a comparative study between two groups of nurses was performed to obtain information on the outcome of a systematic application program on nursing documentation. Actually, all nurses in both groups earned simple knowledge about the documentation before implementation and commencement of the program. After the program was applied to the experimental group, nursing documentation practice was clearly changed in this group. The two groups were equivalent regarding their demographic data, and the present work gave positive insights in general.
The present work tried to address the satisfaction of nursing care documentation practice and barriers related causes. It was revealed that nursing care data at the hospital in question in Sulaimani is incomplete, and almost all of the provided nursing care is not documented. Intervention with the two groups showed that the majority of the nurses in the experimental group (75.29%) accepted it as a good new tool, and most of the control nurses (98.78%) reported the old tool as a bad documentation tool. The results also showed that the nurses in the A and E Hospital in Sulaimani, Iraq were satisfied with the new tool.

In the present study, the nursing care documentation practice in the control group was lower than the study carried out in Jamaica 98% (5) but it is inconsistency with the experimental group and hospitals of England 47% (6). This might be due to the differences in organizational structures (5), the number of patients belong to registered nurse, closeness of the nurses with the needed documentation plan, poor hospital policy, lack of interest in work, lack of sense of responsibility at work, lack of training courses related to documentation, and lack of motivation and punishment. On the other hand, the effect of the documentation program was satisfactory because, after documentation program, the nurses accepted the new tool and improved the objective of the present study. Simultaneously, incomplete nursing care documentation was mentioned by Felege Hiwot in Ethiopia hospital that indicated about 87% of the given medicines to the patients were related to erroneous documentation (7).

On the other hand, the recorded nursing care documentation in this current study was higher than studied 488 hospitals across 12 European countries (20) and some teaching hospitals of Iran (8) which were about 28% and 22.9% respectively. The possible reasons for this could be hospital policy, culture, number of the studied samples and the number of hospitals covered for the study. For this present study, almost all available hospitals in the Sulaimani City were included, in line with the study’s aims. Whereas, the study conducted in Iran was only from patients at medical-surgical wards of four teaching hospitals in which these hospitals were under high workloads that could be a leading cause for lower nursing care documentation practice (8).

In this study, we identified that too many factors are significantly related to proper nursing care documentation practice such as place of work. In this regards, we realized that the electronic system in the oncology unit improved documentation practice while the Accident and Emergency Hospital applied the proposed, which was considered as an adequate documentation practice. This observation was in line with the studies outcome carried out in Jamaica (5, 9) which might be due to that nurses did not have sufficient time for documentation as well as the tendency to use the standard nursing care documentation program.

Moreover, we also confirmed that the documentation program was significantly associated with proper nursing care documentation practice in which the participants that included in the proposed program seemed to have adequate nursing care documentation practice compared to those that were not included. This outcome is in agreement with studies performed in Sweden (10) and Iran (11, 12) in which they also mentioned that training improved motivation and teamwork improved the nursing care documentation practice (11).

Regarding documentation barriers and whether well-written nursing documentation can be replaced with verbal shift reports, some nurses choose ‘Yes’ and others ‘To some degree’ which is in disagreement with nurses suggestion in a research conducted in Ehrenberg (13) in which the oral shift report was well-advised than the written documentation. Again, Lamond reported that nurses promote verbal information than documenting of data by written (14). All these differences in this issue might be due to the differences in the level of knowledge about as in our study the majority of the nurses addressed that they were more knowledgeable than those in Ehrenberg. This result is in consistent to that of Dowding result which stated that oral record are not enough to communicate with patients to enable patient care (15).

This is in agreement with the researches conducted in Nigeria, Iran, Jamaica (5), Australia, Sweden, and the United States in which comprehensively explained that keen knowledge of nursing care documentation improves familiarity with documentation guidelines and manuals, hospital policy, the adherence to exchangeable nursing practice and nursing professionalism. On the other hands, nurses with a great attitude toward nursing care documentation had adequate documentation practice when compared to those with an improper attitude. This result is in line with the results conducted in Sweden (10, 16) which might be related to the fact that a good attitude toward nursing care documentation improves the motivation of nurses to document nursing care.
It was realized that the included nurses practiced a high degree of support from management which is considered as a prerequisite for optimal documentation according to the VIPS model (17). In the present study, the experimental nurses had a powerful perception of support that might be due to receiving a special training practice.

**Conclusion**

We concluded that practicing good nursing care documentation is very inferior and the implementation of improved program had a positive impact on nursing documentation and understanding of the nursing process. Thus, we confirmed that this study might have broad necessitate for education, practice, and research. Additionally, we revealed that it is necessary to educate almost all nurses in the ward to make the desired changes as they need to spirit that both ward and hospital management support the efforts made to change the documentation system. Additionally, applying the documentation program can be used as a clinical experiment in order to improve the patient outcomes as well as to introduce new technology without proper scientific evaluation.

**Conflict of Interest:** None.

**Funding Sources:** This research received specific grant from University of Sulaimani, Kurdistan Region-Iraq.

**Ethical approval details:** As soon as approval was issued for the instrument of the study, official permission was obtained from the College of Medicine, Sulaimani-Iraq. Another approach was issued from the Health Directorate of Sulaimani and an official permission was granted from the Accidental and Emergency Hospital.

Relationship between Training on Employee Performance

Devita Tintasari¹, Swasti Niramaya¹, Nyoman Anita Damayanti²

¹Student of Health Policy Administration Program Study, ²Lecturer of Health Policy Administration Program Study, Faculty of Public Health, Airlangga University, Indonesia

Abstract

Training is an effort to develop human resources, especially to develop intellectual ability and personality. Performance is the appearance of the work of personnel both quantity and quality within an organization. This study aims to determine the relationship of training on employee performance at the Clinic Miftachul Munir Medika Surabaya. This research was conducted at Miftachul Munir Clinic, Medika Surabaya. The type of research used is quantitative research using cross sectional study. The population is employee Clinic Miftachul Munir Medika Surabaya with a large sample of 18 people. The statistical test used is chi square test. This research was conducted in December 2017. The result of the research shows that there is no correlation between training on the performance of clinical employees of Miftachul Munir Medika Surabaya with p value of 0.341 (> 0.05).

Keywords: Training, employee performance and clinic.

Introduction

The development of increasingly sophisticated technology requires everyone to be able to keep up with these developments, not to mention the human resources in a company. This is because many companies are already based on technology. The rapidly changing technology demonstrates that technological innovation will continue to accelerate the company’s future work processes ¹.

Institution of health service for society with its own characteristic and influenced by the development of health science, technological progress and socio-economic life of society which must still be able to improve service more quality and reachable by society to realize the highest health degree².

These changes require individuals to think creatively, quickly, and appropriately to become competing individuals. Training is often regarded as the most visible and most common activity of all staffing activities. Superiors support the training because through training the employees will become more skilled, and therefore more productive, even if those benefits must be taken into account with the time that will be spent when the employees are being trained. Therefore, with the training provided by the company can lead to the ability to employees.

Basically performance is the level to which employees reach job requirements. If the execution of the work has been appropriate or even beyond the job description, this means the work is done well, and vice versa. Through training, employees will know to where and how their work performance is assessed by superiors. The advantages and disadvantages that occur will be a capability for their development in the future.

The results of previous research by Farooq and Khan (2011) show that training and feedback can improve employee work skills. Suggests that training is a key element for improving performance, which can increase the level of individual and organizational competencies³. While research Yuliati (2009) showed that there is no significant influence between training on employee performance⁴.

Based on the description above, the researchers wanted to know how the relationship of training on employee performance at the Clinic Miftachul Munir Medika Surabaya.
Literature Review

Training: Training as a motivational tool that encourages employees to work with the optimal ability, which is intended to improve the performance of these employees. The provision of training is intended to meet the work standards set by the company. Training can be defined as a planned effort to facilitate learning about work related to employees’ knowledge, expertise and behavior.

According to Mathis, “Training is a process whereby people achieve certain abilities to help achieve organizational goals”. Therefore, this process is tied to various organizational goals, training can be viewed as narrow or broad. In a limited way, the training provides employees with specific, knowable knowledge and skills employed in their current work.

Training according to Dessler is “The process of teaching new or existing employees, the basic skills they need to carry on their work”. Training is one effort to improve the quality of human resources in the world of work. New or existing employees need to attend training due to job demands that may change due to changes in work environment, strategy, and so on. So according to the opinions of the experts above can the authors conclude, that the Process teaches new or existing employees by achieving certain abilities to help achieve the goals of the organization or company. Through training, workers will become more skilled and therefore more productive, and achieve new capabilities that are useful both for their current and future work, even if they should be taken into account with the time consumed while the worker is being trained.

Employee performance: Every human being has the potential to act in various forms of activity. The ability to act was acquired by humans either naturally (at birth) or studied. Although humans have the potential to behave certain but the behavior is only actualized at certain times only. The potential for certain behaviors is called ability, while the expression of this potential is known as performance. Operationally performance can be defined as an action or execution of a task that has been completed by a person within a certain time and can be measured.

Performance is “a work achieved by a person in carrying out the tasks assigned to him based on his skills, experience, and sincerity and time”. There are 3 (three) main factors that affect the performance of the individual (work ability), business work (desire to work), and organizational support (opportunity to work). In other words that performance is the work achieved by a person in carrying out the task assigned to him in accordance with the criteria set.

Another term of performance is measurable human output of productivity, absenteeism, turnover, citizenship, and satisfaction.

“There are 4 (four) elements contained in the performance are the results of the job function, the factors that affect the achievement of employees, the achievement of organizational goals, and certain period of time”.

From some sense that has been mentioned above, it can be concluded that performance is an action that affects the performance of the individual (work ability), business work (desire to work), and organizational support (opportunity to work) completed in a certain time so that can be measured the performance of the individual.

Material and Method

This research is an analytic observational research with cross sectional study design. Data collection is done in December 2017. Population is the entire subject of research to be studied. The population in this study was all employees of clinic which amount to 18 people. Respondents were interviewed with a kuisiner tool. The questionnaire contains questions about employee training and performance at the Miftachul Munir clinic in Surabaya. Independent variable in this research is training, while the dependent variable of this research is performance of clinic employee. The data obtained will be processed and presented in the form of cross tabulation, and then analyzed using Chi-Square test relationship.

Results and Discussion

Based on the results of interviews with the help of questionnaires instruments to 100 respondents who are all employees at the Clinic Miftachul Munir Medika Surabaya with a large population of 18 people.

Table 1. Distribution of training frequency clinic employee Miftachul Munir Medika Surabaya in December 2017

<table>
<thead>
<tr>

<tr>
<td>Not Good</td>
<td>4</td>
<td>22.2</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100</td>
</tr>
</tbody>
</table>
Based on table 1 it can be seen that there are employees who received good training as many as 14 respondents (77.8%) and poor minority training as many as 4 respondents (8.3%). According to the researcher’s assumptions, the better and often the training will increase the employee’s knowledge in performing their daily performance.

Training is an effort to improve the technical, theoretical, conceptual and moral skills of employees. Training is a process in which people gain the ability to help achieve the goal of the organization. And training is a systematic process changes in employee behavior to achieve organizational goals.

Based on Presidential Instruction no. 15 of 1974 on the principle of the implementation of education and training, that training is the process of teaching and learning to acquire and improve skills outside the education system in force, in a short time, and with method that prioritize practice rather than theory. Training is a systematic process changes employee behavior in a direction to improve organizational goals.

Training is a planned business in facilitating employee learning to improve competence that suits the needs of the job. There are three conditions that must be met in training activities. A third requirement is that training should help employees improve their knowledge in performing their duties; training should lead to changes in work habits of employees, work attitude, information and knowledge applied in the task; and training should be linked to a particular job.

Table 2. The following frequency distribution Performance employee clinic Miftachul Munir Medika Surabaya in December 2017:

<table>
<thead>
<tr>

<td>72.2</td>
</tr>
<tr>
<td>Low</td>
<td>5</td>
<td>27.8</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
<td>100</td>
</tr>
</tbody>
</table>

In the result of bivariate analysis test results obtained that there is no relationship training on employee performance in Clinic Miftachul Munir Medika Surabaya. This can be seen from the result of p value 0.341 (> 0.05) indicating that training does not have significant relation to employees performance.

Can be explained that the training has not become a variable affecting employee performance and there are other variables that can affect or improve the performance of clinical employees Miftachul Munir Medika Surabaya.

This is because the training given to the employees of Miftachul Munir Medika Surabaya clinic will be the same, because the training is not all employees. So not all employees who can feel the impact, so it shows the influence is not significant.

This is also evidenced by respondents’ answers in accordance with the field being worked on. Employees desperately need special potential that supports job description.

The above results are in accordance with Yuliati study which explains that there is no significant influence between training on employee performance because the training is aimed to improve the present work performance only. But not in accordance with research conducted by Sultana et al, which explains that training is a key element to improve performance. Explain that organizational success depends on the skills and abilities of their employees, so it takes a lot of training as the development process.
Conclusions

Based on the results of research and discussion as has been stated in the previous section, then at the end of the results of this study can be drawn conclusion as follows:

1. There are 22.2% of Miftachul Munir Medika Surabaya clinic employees in December 2017 which is not good in training.
2. There are 27.8% of Miftachul Munir Medika Surabaya clinic employees in December 2017 who have low performance.
3. There is no relationship between training on employee performance Miftachul Munir Medika Surabaya in December 2017 (p-value = 0.341).

Ethical Approval: Related departments should be assured about the confidentiality of the results of questionnaires.

Conflict of Interest: The authors report no conflict of interest.

Premarital Screening to Determine High-Risk Pregnancy: A Systematic Review

Dewi Puspitaningrum¹, Nuke Devi Indrawati¹, Indri Astuti Purwanti²

¹Midwifery Program, ²Public Health Program, University of Muhammadiyah Semarang, Jl. Kedungmundu Raya No. 18, Semarang, Indonesia

Abstract

Introduction: Maternal Mortality Rate (MMR) in Indonesia was 305 per 100,000 live births in 2015. In fact, the Millennium Development Goals (MDGs) target was 105 per 100,000 live births. That’s why MMR becomes the highest priority in this country. There are many evidences about high-risk pregnancy. Etiology of MMR is determined by two categories. They are direct cases and non-direct cases.

Method: Primary studies to be included in this systematic review were searched from electronic databases such as Pub Med and EBSCO. Hand searching through Journal of about premarital screening with high-risk pregnancy was also conducted. The findings of the included studies were extracted using article finding extraction form and appraised based on the journal level of credibility. The analysis of the study was presented in narrative form.

Results: This review produced ten quantitative studies using that method. A total of 10 papers are found the inclusion criteria included in this systematic review. Ten synthesis findings of the challenges in determining high-risk pregnancy and possible solutions were identified in the literature: about premarital screening hepatitis B, C dan degenerative sick, gestational diabetes mellitus, social condition, screening β thalassemia, screening chlamydia trachomatis and screening HIV.

Conclusions: The evidence of determining high pregnancy in developing countries is limited. However, the challenges in screening about determining high-risk pregnancy in developing countries are remain similar to those faced by developed countries. This can be guidance for developing countries to plan, initiate, and implement determine high pregnancy for premarital screening. Future studies about determining high pregnancy of premarital screening in developing countries are highly recommended.

Keywords: Premarital, screening, high-risk pregnancy.

Introduction

Maternal Mortality Rate (MMR) in Indonesia was 305 per 100,000 live births in 2015. In fact, the Millennium Development Goals (MDGs) target was 105 per 100,000 live births. That’s why MMR become the highest priority in this country¹.

Etiology of MMR is determined by two categories. They are direct cases and non-direct cases. The percentage of non-direct cases was getting higher along 2010-2013. It increased from 32.2% to 40.8%. It consisted of communicable and non-communicable disease (degenerative disease), such as hepatitis, cancer, chronic kidney failure, heart disease, tuberculosis (TBC), HIV/AIDS, etc. All of those diseases could be screened before marriage². A systematic review for those diseases has not existed yet. There were only 2 (two) systematic review before. They were systematic review for premarital hepatitis screening³ and spectrum of mutation of cystic fibrosis in the 22 Arab Countries⁴.

Systematic review for premarital such as age, municipality of origin, year of follow-up, gestational
age, prenatal risk, number of visits performed during prenatal care, previous obstetric and clinical history, intercurrences during pregnancy or delivery, beginning of sexual life, number of partners, gestational outcome, and specific variables such as history of vaccination for hepatitis B and the results of viral markers for hepatitis B and C\footnote{1}. And systematic review about from EBSCO about premarital screening such as Age, Race, Marital Status, Paritas, Physical Fitness Test Performance, Pregnancy Diagnoses and Pregnancy Characteristics, HIV testing, pregnancy screening, assess the knowledge among parents of thalassemia major patients about prenatal diagnosis, premarital screening for carrier detection and impact of consanguineous marriage on disease transmission, Diabetic fetopathy; Gestational diabetes; Overweight/obesity, Chlamydia trachomatis-infected pregnancy.

Method

This study used a systematic review as the study methodology to answer the research question of: “What is the determine high-risk pregnancy?” The studies included in this review are primary research in a quantitative design that evaluates the determine high-risk to used premarital screening. These studies include cohort study, and other method of quantitative research. This review considered the population of interest, which includes women who know about premarital screening for preventive high-risk pregnancy. The exclusion criteria of this systematic review are studies that did not concern about premarital screening for pregnant women, and non-primary studies, including reviews, commentaries, opinion articles, and editorials. The search strategy found both published and unpublished studies that are limited to English language and full texts only. Electronic databases such as PubMed, and EBSCO were searched using several combinations of terms to identify any relevant studies (Table 1). Hand search to find the relevant unpublished studies through Journal of Inter-professional care was also conducted, but it resulted in similar articles as those found in PubMed and EBSCO. The title and abstract of the studies produced from the search were assessed based on the inclusion criteria.

The data extraction tool used in this review is to use a meta-analysis which combines the results of statistical quantitative research\footnote{2}. This tool is used to collect information by setting inclusion and exclusion criteria from selected research results in a meta-analysis with the same variables and method. This systematic review uses an 8-step quantitative meta-analysis assessment tool. This has been chosen rather than other critical assessment tools because each item in the checklist is presented very clearly and includes all the information needed to assess quantitative research, including the nature and suitability of methodological approaches and specific method\footnote{3}. A meta-analysis was carried out for papers included in the statistical form. Findings from quantitative research were collected using the meta-analysis method. Findings were collected according to inclusion criteria. Identifying research questions, developing protocols for meta-analysis research, selecting relevant research results, selecting quality research results, extracting data from individual studies, synthesizing research results with meta-analysis method (funnel plot and forest plot) and presentation of research results in the research report from the meta-analysis.

Results

The search strategy produced in 39 potentially relevant papers to be examined. After examining the abstracts, 10 studies were selected. See the inclusion criteria and the 4 papers that were included in this systematic review from PubMed: 6 papers from Ebso. A meta-analysis was conducted for ten included papers (Barros, et al, 2018; Al Rubeaan K, et al, 2014; Bundey...
S, et al., 1990; Anjum Q, et al, 2016; Michael J Miller, et al., 2017, Fielder O, et al., 2005, Amani A, et al, 2016, Abid H, et al, 2012, Bancher, et al, 2016, Das B, et al, 2016) in accordance with the framework provided for quantitative meta-analysis. Ten findings and illustrations were taken from quantitative studies, and each finding was given a level of credibility according to the criteria of quantitative meta-analysis. The findings were then identified according to the purpose of a systematic review to produce eleven categories, and the similarity of findings in a sense. The ten categories were then treated with a meta-analysis to produce several synthesized findings that could potentially be used as a basis for evidence-based practices related to determinants in high-risk pregnant women. The synthesized findings are: determinants that can affect high-risk pregnant women who can be used in prevention in premarital women;

**Discussion**

**Screening of Pregnant Women About Hepatitis B, C, and Degenerative Disease:** In screening the association of degenerative diseases according to Baroos et al. (2018), Twelve cases with positive HBsAg (1.9%), 189 cases with positive anti-HBs (35.9%) and seven positive anti-HCV patients (1.3%) were observed. There was no significant association between age and positivity for HBsAg, anti-HBs, and anti-HCV ($P = 0.205, 0.872$ and 0.676, respectively). There is a direct relationship between the anti-HBs positivity and the last four years of the study ($P<0.0001$). So that a high prevalence of HBs is observed, higher than expected for the evaluated region; there was a prevalence of anti-HCV, consistent with the current Brazilian reality; and it is likely to be a low rate of hepatitis B immunization, with a relatively high rate of susceptibility to infection and no case of infection between B and C viruses and HIV. It is emphasized not only the need to trace hepatitis B and C, without exceptions, during prenatal care, since even though the current advances in therapy may not cure, at least they may allow you to have a chronic disease and the mandatory completion of immunophylaxis in all newborns. Particular attention should be given to those patients who are susceptible to HBV, with prompt diagnosis and referral for specific vaccination.

In screening about HBsAg, the results of the Amani et al. (2016) study followed a positive HBSA patient in Germany. In 78.3% of women, the diagnosis was made during pregnancy screening, which is the only reinforced screening procedure in Germany. Of the total cohort, 15% developed at least one severe liver-associated complication. By multivariate analysis, the prognosis was associated with high age and cirrhosis, but not with sex.

**Screening of diabetes mellitus:** Pregnant women within screening the association of diabetes mellitus according to Al Rubea et al. (2014) regarding the survey of differences in abnormal metabolic sugar in pregnant women with the results study that the overall GDM prevalence was 36.6%, categorized into 32.4% new cases and 4.2% known cases. Another 3.6% had preconception type 1 or 2 diabetes. GDM cases were older and had a higher body mass index, a higher rate of macrosomic baby, and a history of GDM. Monthly incomes, educational level, living in urban areas are not significantly different between normal and GDM cases. The most important and significant risk factors for GDM were the history of GDM, macrosomic baby, obesity, and age $>30$ years. However, according to Anjum Q et al. (2016) regarding primary care management in cases of gestational diabetes mellitus with research results, according to Anjum Q et al. (2016), the family history of diabetes and increased triglycerides. An important issue for the importance of multiple criteria for diagnosing and screening GDM. There is a need for a single guideline globally to avoid confusion for primary care providers. Primary care centers can be used to screen for GDM at early stages. This will also improve continuity of care, and according to Bancher et al. (2019) about gestational diabetes mellitus with the results of the study that all women with GDM should receive nutritional counseling, be instructed in self-monitoring of blood glucose and increased physical activity to moderate intensity levels, if not contraindicated. Maternal and fetal monitoring is required in order to minimize maternal and neonatal morbidity and perinatal mortality.

**Social Conditions of Pregnant Women:** In screening about social conditions that can affect pregnancy, according to Bundey S et al (1990) regarding the existence of race, kinship and social baby, according to Miller MJ et al (2017) about the effects of pregnant women on standard physical fitness tests the results of the study showed that 142 women were included in the case-control portion. Muscular strength was reduced postpartum; the mean number of sit-ups was 73.4 and 67.1 ($p \leq 0.001$), and the mean number of pushups was 38.5 and 35.2 ($p = 0.002$) pre-pregnancy and postpartum, respectively. Sixteen women failed PP1 compared with 5 women failing before pregnancy; odds ratio (OR) 3.2.

Women who failed PP1 were significantly older compared with women who passed PP1, mean age 31.4 and 27.3 (p = 0.02); respectively. Significantly more women failing PP1 had a diagnosis of gestational diabetes OR 5.4 (1.1, 27.4) and anemia in pregnancy OR 11.9 (1.2, 164.5)^7.

**B-Thalassemia Disease Screening β-Thalassemia:**
Disease screening where according to Abid H (2012) about parental awareness in β-Thalassemia major disease in detecting pregnancy and premartial screening. The results of the study were 74 male (64.3%) and 41 female (35.7) patients with mean age of 9.5 ± 5.1 years. Eighty-eight patients (76.5%) were accompanied by mothers and the rest by their fathers. Seventy-four parents (32.1%) were illiterate; among the literates only 7 were highly educated (3%). Ninety-four couples (81.7%) had consanguineous marriage. Fifty-two parents (44.6%) knew that thalassemia was an inherited disorder. Thirty-eight (33%) had heard about the test for detecting thalassemia carriers. Premarital screening and prenatal diagnosis were known to 97 (84.3%) and 88 (76.5%) parents respectively. Ninety-nine parents (86.1%) knew it was acceptable religiously (60%). Major sources of information are parents^9.

**Screening of Trachomatic Chlamydia Disease:**
Screening of chlamydia trachomatis according to a study by Das B et al (2016) on the effects of chlamydial trachomatis treatment during pregnancy with the results of a study that Among the 350 pregnant women were controlled initially for the study, C. trachomatis positivity was found to be 18.8% (n = 66) in the endocervix by DFA and PCR assay. Co-infection with Candida spp., Bacterial vaginosis, T. vaginalis and T. pallidum were 2.0%, 1.7%, 1.7% and 0.5%, respectively. None of this is infected with N. gonorrhoeae. Pregnant women at increased risk of pregnancy infection included those who had multiple births and were second trimester of pregnancy. Fifteen patients of group I became Chlamydia-negative following treatment. Data on obstetric outcomes were recorded in 11, 26 and 127 patients of groups I, II and III, respectively. The mean duration of gestation for premature is significantly higher in groups I in comparison with group II [35.5 vs. 33.1 weeks (P <0.05)], the current showing the improved effect of treating on pregnancy outcomes.\textsuperscript{14}

**Screening for HIV infection:** Screening for HIV infection, according to Fielder O et al. (2005) study of attitudes and beliefs of pregnant women about HIV testing and HIV testing policies in infants during the use of taking HIV drugs. That with the results of the study Quantitative Longitudinal Cohort Studies. of the 610 drug users interviewed in two long-term cohort studies conducted from 1997 to 2001, nearly all (89 percent) all subjects (91 percent) believed that women should be tested for HIV. More subjects who have prior HIV testing are believed to be tested for HIV (92.9 percent versus 82.6 percent, p = 0.008). Although 86 percent of the subjects agreed that all newborns should be tested, only the percent of all subjects believed to be mandatory. However, more injectors than non-injectors would avoid prenatal care if HIV testing was required during pregnancy (16.2 percent versus 6.1 percent, p <0.01. The concern for a baby’s health is the primary reason for supporting mandatory testing. Perceived discrimination by the healthcare system is a barrier to acceptance of testing strategies, as it was in the structured interviews\textsuperscript{11}.  

**Conclusion**
Systematic review shows that in prevention of premarital it is necessary to pay attention to several indicators in checking before going through the marriage phase, where screening is important with screening for hepatitis B, C, and degenerative diseases, and screening for regulating blood sugar metabolism so that it does not become diabetes mellitus, screening the importance of physical training in preparation later for a healthy pregnancy, as well as the need for parental support in recognizing β thalassemia disease because parents who respect it will be for the prevention of β thalassemia disease, and also screening for Chlamydia trachomatis treatment because every pregnancy is likely to occur chlamydial trachomatis infection, as well as screening for HIV infection to prevent transmission to the baby. So it’s highly recommended once in preparation for premarital screening.

Different Grades of BMI is Correlated with Left Atrium and Ventricle Structure in Patients with Hypertensive Heart Disease

Meity Ardiana¹, Rofida Lathifah², Makhyan Jibril Al-Farabi¹³, Muhammad Satya Bhisma¹

¹Department of Cardiology and Vascular Medicine, Faculty of Medicine, ²Department of Health Policy and Administration, Faculty of Public Health, University of Airlangga, Surabaya, Indonesia, ³Postgraduate School, University College London, Gower St, Bloomsbury, London WC1E 6BT, UK

Abstract

Background: Hypertensive Heart Disease (HHD) is usually followed by cardiac remodeling. Different grades of Body Mass Index (BMI) also influence the cardiac structure. Hence, we evaluate the cardiac structure of HHD patients with various BMI grades.

Materials and Method: This cross-sectional study involves 50 consecutive patients with HHD (hypertensive heart disease) from the Cardiology and Vascular Medicine Department, Soetomo General Hospital Indonesia. Echocardiographic examination was done using GE vivid 7. Statistics were evaluated with SPSS 25.0.

Results: The research showed that the grades of BMI (body mass index) was positively correlated with LA major (r=0.335), RA Major (r=0.371), LVD Mass (r=0.341), LVS Mass (r=0.303), LVPWD (r=0.369), LVPWS (r=0.391), and inversely correlated with LVSI Dopp (r=−0.376). Obese (BMI>30) patients have significantly lower ejection fraction compared to normoweight (BMI<25) patients (64.3±3.67% vs 62.12±0.98%, p=0.046).

Conclusions: The grades of BMI in the HHD patient is associated with an increased volume of the left atrium and ventricle. This suggested that obese patient with HHD should be assessed carefully for atrial and ventricle enlargement.

Keywords: Cardiac Structure, Echocardiography, Hypertension, Obese, Remodelling.

Introduction

Hypertensive heart disease (HHD) can be manifested as asymptomatic cardiac hypertrophy to clinical heart failure. Alteration of blood vessel and cardiac structure in the HHD was caused by the chronic elevation of the blood pressure.¹ This remodelling subsequently contribute to the pathophysiology of circulatory disorders in the HHD patient.² The progression of cardiac structure remodelling in the HHD patient is influenced by various factor such as type of overload, neurohormonal activation, co-existence with other diseases and genetic factors.³

Obesity rates are rising worldwide. Obesity is defined as abnormal or excessive fat accumulation that may impair health, including increased risk of cardiovascular disease and hypertension that may induce some changes in cardiac structure and function. World Health Organizations (WHO) and National Institute of Health defines Normal weight as BMI 18.5-24.9, Overweight as BMI 25-29.9, Obesity as

BMI ≥ 30 kg/m², severe obesity as BMI ≥ 40 kg/m², and super obesity as BMI ≥ (50 kg/m²). Obesity may also induce several modifications in cardiac structure and function in the absence of other atherosclerotic risk factors, to the extent that some authors have suggested the specific form of “obesity cardiomyopathy,” which resulted in left ventricular (LV) structural and functional abnormalities. Obesity is well known to imply some cardiac consequences with the inducement of several modifications in cardiac structure and function, which are associated with hemodynamic volume overload. Atrial and ventricular remodeling is common in obese patients, and this pathophysiological change plays a pivotal role in atrial and ventricular dysfunction. Hence, it is hypothesized that different grades of BMI may contribute to the cardiac remodeling progression in the HHD patient. This research investigates whether different grades of BMI status is correlated with echocardiographic findings in HHD patient.

Materials and Method

Research Design: This retrospective study consisted of subject ≥ 18 years old with hypertensive heart disease evaluated at the Echocardiography Laboratory of the Department of Cardiology and Vascular Medicine Dr. Soetomo General Hospital, Surabaya, Indonesia between January 2018 and January 2019. Eligible patients required to have LV Ejection Fraction (EF) ≥ 50%. Normal weight, overweight, and obesity were defined according to body mass index (BMI) established criteria. Diabetes mellitus and hypertension were defined according to current recommendations. Patients were excluded if they had a history of acute coronary syndromes, angina, or revascularization procedures or evidence of segmental wall motion abnormalities at echocardiography, or a history of heart failure. Other exclusion criteria were significant aortic or mitral valve disease, severe mitral annular calcification, hypertrophic cardiomyopathy, secondary forms of cardiomyopathy, stroke, peripheral artery disease, and chronic kidney disease.

Doppler Echocardiography: Transthoracic two-dimensional and Doppler echocardiographic examination was carried out by Vivid S6, Logic E9, and Vivid S60 Ultrasound instrument (General Electric) with 2nd-harmonic imaging and a 3.5-MHz transducer. Patients were examined in the left lateral decubitus position, and data were acquired in the parasternal (long-and short-axis views) and apical views (two chambers (A2C) and four chambers (A4C) and apical long-axis views). In every echocardiographic evaluation, all parameters were derived according to current indications and considered in relation to their established reference ranges. Left ventricular volumes and EF were calculated from apical A2C and A4C views using the TEICH and Modified Simpson’s Biplane rule. LV mass was calculated and indexed according to body surface area and height. Left atrial (LA) and Right atrial (RA) size were also measured by major and minor dimension. Relative wall thickness (RWT) was derived as the ratio between 2 multiplied posterior wall diastolic thickness and end-diastolic diameter. Pulsed wave Doppler mitral velocity curves were obtained from the A4C view by positioning sample volume between the tips of the mitral valve leaflets in diastole. From mitral velocity tracings, peak early (E) and late (A) transmitral flow velocities, their ratio E/A, and E-wave deceleration time (EDT) were measured accordingly. From A4C view, tissue Doppler longitudinal velocities were recorded with the sample volume placed at the junction between LV wall (medial and lateral) and the mitral annulus. The ratio of mitral E peak velocity and averaged ratio of mitral to myocardial early velocities (E/e′) was calculated. The peak tricuspid regurgitation (TR) velocity was measured from the maximal velocity of tricuspid Doppler regurgitant jet. To derive stroke volume and cardiac output using Doppler method, continuity equation at LV outflow tract and velocity time integral were used.

Statistical Analyses: Statistical analyses were performed using IBM SPSS Statistics 25.0. Data are considered significantly different if p<0.05. Continuous variables, presented as mean±SD, were evaluated for normal distribution and compared using the ANOVA test, as appropriate. The correlation was evaluated with Spearman Rho analysis followed by multiple stepwise linear regression test to determine Beta Coefficient and R-square.

Findings

Demography of HHD patients: The echocardiographic finding was obtained from 50 HHD patients with demography as follow:

Comparison of the echocardiographic finding of normoweight (BMI<25), overweight (25 ≤ BMI<30), and obese (BMI >30) patient with HHD. Different annotation showed a significant difference (p<0.05) if compared with normoweight (a), overweight (b), obese (c).

As shown in Table 2 above, Significant difference was observed between normoweight and overweight patient in LA Major, RA Major, and LVSI Dopp (p<0.05). Comparison between normoweight and the obese patient showed a significant difference in RA Major, LVD mass, LVS mass, LVPWD, and LWPWS (p<0.05). Comparison between overweight and obesity only showed significant difference in Ejection Fraction and LVPWS (p<0.05).

Annotation * showed significance at p<0.05 and ** showed significance at p<0.01
As shown in table 3 above, Positive correlation was shown between different grades of BMI with LA Major, RA Major, LVD Mass, LVS Mass, LVPWD, and LVPWS. Inverse correlations can be observed only on LVSI.

**Discussion**

Obesity induces several modifications in cardiac structure and function, which are associated with hemodynamic volume overload. Atrial and ventricular remodeling is common in obese patients, and this pathophysiological change plays a pivotal role in atrial and ventricular dysfunction. In this research, we found that comparison between obese patient has significantly higher RA Major, LVD mass, LVS mass, LVPWD, and LVPWS. Previous longitudinal research has demonstrated that increasing BMI for 5 units from normoweight patient in the 4 years, can significantly increase the LA and LV compared to patient without increased BMI. Other cross-sectional studies also demonstrated that obesity and greater BMI are correlates with the larger LA dimensions. Previous research also showed that patient with lower BMI (BMI <18.5) will also followed by significantly lower LVMI and smaller LV mass. This suggested that atrial and ventricular dimension are increased in the HHD patient as BMI grades increased.

Correlation test also showed that different grades of BMI are positively correlated with LA Major, RA Major, LVD Mass, LVS Mass, LVPWD and LVPWS, suggesting that higher BMI grades will affect the volume of the left atrium, right atrium and left ventricle. Additionally it will also affect the systolic and diastolic function of left ventricle. Previous research also showed similar finding, which found a linear correlation between increased LV mass (g/m²) with BMI. It was also shown that increased BMI is related to both LV systolic and diastolic dysfunction. However, another study showed that obesity might not follow by increasing the LV Mass if the obesity is followed by confounding disease, which can alter the hypertrophic progression such as myocardial infarction. This suggested that in the patient with HHD, increasing BMI is associated with atrial and ventricular enlargement and HHD may not alter the hypertrophic progression of the heart muscle.

There are several limitations to our findings. Firstly, obesity was only measured through BMI rather than the direct measurement of central obesity, such as abdominal circumference or waist and hip circumference. While many studies have shown that central obesity measurement is more robust predictors of cardiovascular outcomes, this suggested that more detailed metrics of central adiposity will be important to be considered in future studies.

Secondly, our sample size was limited and not equally distributed between underweight, normoweight, overweight, and obese which might affect lack of significance in cardiac dimension measured through echocardiography. More samples with better distribution among the BMI grades would be beneficial for future research. Thirdly, as the data only derived from single cardiology center in urban area, the data may not be representative or generalizable to other populations.

**Conclusion**

BMI grades is associated with the functional and structural changes such as LA Major, RA Major, LVD Mass, LVS Mass, LVPWD and LVPWS in the heart of HHD patients.

**Conflict of Interest:** The authors declare no conflict of interest

**Source of Funding:** This research received no external funding

**Ethical Clearance:** The research was conducted in accordance with the Helsinki declaration of 1975 as revised in 2000. All participating patient has signed written informed consent. The study protocol has been approved by the local ethics committee. Data which shows patient personal information was omitted.

Relationship Analysis of Factors with Implementation Measures Collaboration Effective Nurse in the HA Thalib Hospital Kerinci Indonesia 2018

Moza Suzana¹, Suharizal², Lili Fajria³

¹Master Program of Nursing Department of Nursing Leadership and Management, Faculty of Nursing Andalas University, ²Lecturer of Faculty of Law, Andalas University, ³Lecturer of Faculty of Nursing, Andalas University, Padang, West Sumatera, Indonesia

Abstract

Background: Collaboration in health is very important because each health worker has knowledge, skills, keahlian, and different experiences that can improve performance in various aspects related to health care system. This study aims to determine the relationship of factors related to the effective implementation of nurse and doctor collaboration.

Method: This research is a quantitative study with cross sectional design. The sample in this research is Team Leader at Inpatient Installation of Major General HA Thalib Kerinci General Hospital which amounts to 39 people with total sampling technique. Data collection using Nurse-Physician Collaboration Scale Questionnaire (NPCS) and Tang 2013. Bivariate data analysis with chi square and multivariate with logistic regression.

Results: The results showed that p-value = 0.042 and communication (p-value = 0.007) had relationship significant with the effective collaboration of nurses and doctors at Major General HA Thalib Kerinci General Hospital. Factors most related to the effective implementation of nurse and physician collaboration are the factors of communication.

Conclusion: It is advisable to the Hospital need to improve the more effective communication between nurses and doctors.

Keywords: Collaborative factors, Effective collaborative, implementation, nursing, hospital.

Introduction

The current health care system, focusing on patient-centered and family-centered services to provide quality care, patient satisfaction, and avoid unexpected events. Effective collaboration among health team members facilitates the delivery of quality services(1). Improving the quality of service is determined by the quality of medical care services and nursing care. Qualified medical care can be provided by professional medical personnel in their fields and quality nursing care can be provided by nursing staff who are equipped with adequate knowledge and clinical skills and have the ability to maintain professional relationships with patients, collaborate with other health team members, carry out activities The collaboration of nurses and doctors is seen as an important factor in the provision of quality nursing care(2).

Collaboration works well if each team member understands each other’s roles and responsibilities, has the same goals, recognizes the expertise of each profession, exchanges information openly, has the ability to manage and perform tasks both individually and in groups in the team. Collaboration in interprofession improves the effectiveness of patient health and safety services(3) states that. The collaboration of nurses and physicians improves clinical outcomes as well as patient satisfaction, can reduce hospital costs(3, 4) and increase satisfaction for families of patients, nurses and doctors(4, 5). More importantly, collaborative relationships between nurses and physicians can reduce patient mortality(5, 6).
The collaboration of doctors and nurses improves the quality of care to patients, shorter treatment periods, cheaper maintenance costs, and reduces the burden and stress of work on health professional teams\textsuperscript{(6)} while interprofession is associated with reduced mortality, increased job satisfaction, and reduced maintenance costs\textsuperscript{(7)}. Based on the preliminary survey, nurses and doctors find it difficult or rare to meet, the lack of mutual understanding between nurses and doctors in collaboration, the interaction between nurses and doctors is more dominated by team leaders and doctors alone, doctors assume that nurses have not been competently invited to collaborate, considered and has no benefit, doctors have dominant authority in all health problems and nurse duty to do doctor’s instructions, not free to discuss and give feedback, still not heard and appreciated. Based on the above description, the authors are interested in conducting research on “Analysis of factors related to the effective implementation of nurse and physician collaboration in Inpatient General Hospital HA Thalib Kerinci which aims to find out factors related to the implementation of effective nurse-doctor collaboration actions.

**Method**

This research is a quantitative research with approach cross sectional. Population and sample in this research are all team leader in Installation of Major General Hospital HA Thalib Kerinci which amounts to 39 people, with sampling technique of total sampling. The data was collected using Nurse Physician Collaboration Scale and Tang 2013 questionnaire which consist of respondent characteristic, related factors and effective implementation of nurse-physician collaboration, with score from 1 to 4. In this research the researcher uses ethical consideration that is informed consent, Anonymity and Confidentiality. The data collected were analyzed using SPSS program with bivariate statistical test using chi-square and multivariate logistic regression.

**Result**

**Characteristics of Respondents:** In the table below shows that the characteristics of the age of almost all respondents 25-35 years, Respondents are almost entirely female (87.2%) with the education level of some vocational respondents 59%, and the working period is mostly ≥ 5 year (74.4%).

![Table 1: Characteristics of Respondents in Inpatient Installation in the HA Thalib Kerinci Hospital](image)

**Factors relating to Collaborative Implementation Effective nurse-physician in the HA Thalib Hospital Kerinci:** Based on table 2, factors related to the effective implementation of nurse-physician collaboration include communication, mutual respect, unequal strength, professional roles, and task priorities. The nurse’s assessment of communication is mostly good (64.1%), almost all respondents have a high degree of mutual respect (97.4%), partial unequal power (59%), professional role (51.3%), and high priority tasks (51.3%) in the effective implementation of nurse and physician collaboration.

![Table 2: Factors Relating to the Effective Collaborative Implementation in the HA Thalib Kerinci Hospital](image)

**Implementation Effective Collaboration of Nurse-Doctor:** Table 3 below shows that the effective collaboration of nurse-physicians is categorized good (53.8%).

Factors most related to Implementation Effective collaboration of nurse-physician: Table 5 below, indicating that the factor most closely related to the effective implementation of nurse-physician collaboration is communication $p = 0.026$ ($p < 0.05$). The result of analysis shows that the highest OR is communication (OR = 6.503) so it can be concluded that communication is the factor most related to the effective implementation of nurse-doctor’s effective collaboration. Value $B = 1.872$, because the value of $B$ is positive, then communication has a positive relationship with the effective implementation of nurse-doctor’s effective collaboration.

Discussion

The results of this analysis show that there was a significant relationship between communication with the effective implementation of nurse-physician collaboration with $p = 0.007$ ($p < 0.05$). This result is in accordance with Anggreny’s study that there is a relationship between communication with nurse and physician collaboration (8). Research Weller, on the perception of 720 nurses and 173 doctors from 84 hospitals in Northern California that nurses often fail to gather all relevant patient information before contacting a doctor. This unclear communication causes the doctors to speak roughly, which will affect the nurse’s attitude toward patient care and hamper teamwork. In addition, observes that doctors and nurses often communicate through written patient care records, wherein information is not always delivered accurately or on time (4, 9).

According to the researchers, respondent age characteristics can also be related to communication in
the effective collaboration of nurse-physicians where almost all (84.6%) of respondents have age 25-35 years. Age factor has a direct relationship with the logic of thinking and knowledge of a person. The more mature a person’s age usually tends to increase his knowledge and maturity level. The ability to control his psychic emotions can reduce the occurrence of accidents so that performance increases\(^\text{(10, 11)}\), which means between mutual respect and the effective implementation of nurse-physician collaboration with \textit{p-value} 0.938 (\(p > 0.05\)).

Based on the research results, the attitude of mutual respect between nurses and doctors in collaboration is good, it is supported that the education level of respondents mostly D3 nursing and 41% professional education level (S1 nursing). According to main research the attitude of doctors and nurses in collaboration is influenced by education, knowledge collaboration and understanding the role of each health profession owned by doctors and nurses. The higher the education the more professionalisme will be and the better the implementation of the collaboration. Therefore it is necessary to improve education to a higher level so that the implementation of effective collaboration will be better.

The results of Rahamita’s implementation of mutual respect and trust to gain trust from others, nurses want their contributions to the care of patients appreciated and recognized by doctors, as nurses appreciate and acknowledge the ability of doctors, but that is not always the case\(^\text{(11)}\). In fact, mutual respect and trust is expected to facilitate a dynamic process between people characterized by a forward desire to achieve the goal and satisfaction of each member to realize effective collaborative relationships\(^\text{(9, 12)}\).

The result of ctest analysis shows that there is a significant relationship between unequal strength with the effective implementation of nurse-physician collaboration with \textit{p-value} 0.042 (\(p < 0.05\)). The results of this study in accordance with Anggreny that there is a relationship of power domination with peawat-doctor collaboration. Petri Research proves that doctors and nurses have decision-making, responsibility and power capacities\(^\text{(12)}\). However, a descriptive comparative study reported that nurses do not feel confident or assertive to communicate and discuss patient care equally with doctors. The nurse senses a power imbalance between the two professions. Hansson\,\textit{et.al} explains that this unequal strength can be attributed to different levels of education, status and ability for each profession\(^\text{(9, 10)}\).

According to Evan \textit{et.al} Organizational environmental factors (\textit{systemic determinants}) are elements outside the organization, such as social systems, culture, education and autonomy (professional). Social systems that can hamper collaborative practice are 1) inequality between each profession, 2) gender differences in which men are more powerful than women 3) differences in economic status. Some cultural systems may impede a collaboration such as professional autonomy\(^\text{(13, 14)}\).

The result of test analysis \textit{chi square} showed that there was no significant relationship between the professional role and the effective implementation of nurse-physician collaboration with \textit{p-value} 0.145 (\(p > 0.05\)). The role of professionals is not good in implementing effective collaboration of nurses and doctors because there are still respondents who clarify the scope of professional expertise when requested by the doctor, not to inform the doctor about the scope of the field of nursing practice.

The lack of understanding of each other’s professional roles, and task priorities influence the nurse and physician collaboration factors suggests that a lack of understanding of the unique role of nurse professionals, will lead to ineffective collaboration between doctors and nurses. Nurse autonomy in the collaboration of doctors and nurses includes reading nurse records, participating in hospital programs and exchanging opinions in the treatment and nursing care of patients\(^\text{(15-17)}\).

The result of test analysis \textit{chi square} shows that there is no significant relationship between task priority and the effective implementation of nurse-physician collaboration with \textit{p-value} 0.639 (\(p > 0.05\)).

Based on the results of the research the task priority is largely unfavorable (48.7%) in the effective implementation of nurse-physician collaboration, where nurses still exist who do not read the nurses’ records and the nurse’s integrated development note format, and judge that the primary duty of the nurse is to follow the physician’s instructions. Based on reported research, that collaboration is influenced by various doctors and nurses authority with respect to patient care. The results of this study indicate that the implementation of effective collaboration is good more on pimer nurse with a working duration \(\geq 5\) years. Mistuti’ long study with nurses’ ability to collaborate with doctors is closely related to the experiences gained during the task. The longer a person works, their knowledge will be better because it has adjusted to his job\(^\text{(9)}\).
Conclusion

It is advisable to the Hospital need to improve the more effective communication between nurses and doctors.

Conflict of Interest: No conflict of interest arose in this study.

Abstract

Typhoid fever is still a major health problem in endemic countries. However, the real magnitude of the incidence rate is unclear and difficult to determine. This study is to evaluate the validity of extrapolation of the seroprevalence in children as a proxy indicator for the level of endemicity.

Two rural areas of South Sulawesi (Paitana subdistrict as the high-endemic area and Bantimurung subdistrict as low-endemic), Indonesia with approximately 1,000 inhabitants each were selected for this study. Diagnosis of typhoid fever was based on the clinical signs and Widal test confirmed by blood culture. Sera were taken from subjects for determination of IgM by ELISA.

The incidence rate of typhoid fever among community both in Paitana and Bantimurung subdistrict was 20.60/1,000 and 8.5/1,000 population, respectively; while the incidence rate of typhoid fever among children both in Paitana and Bantimurung subdistrict was 35.83/1,000 and 9.30/1,000 children, respectively. The seropositivity rates of community in Paitana were significant higher than in Bantimurung subdistrict (11.42% vs 4.67%) (p <0.05). Also, the seropositivity rates of children in Paitana were significantly higher than in Bantimurung subdistrict (45.60% vs. 11.63%) (p<0.05). The high-endemic area in Paitana had similar high-incidence and seroprevalence rates both in community and children. In contrast, Bantimurung subdistrict had much lower incidence and seroprevalence rates both in community and children. The correlation coefficient between incidence and seroprevalence rates was 0.98.

The results revealed that seroprevalence rates among children may use as an indicator and extrapolation of typhoid fever endemicity.

Keywords: Typhoid fever; seroprevalence; community; children; Indonesia.

Introduction

Typhoid fever is still a major health problem in many developing countries. Worldwide, an estimated 17 million persons develop this disease annually. Most of this burden occurs among citizens of low-income countries, particular those in Southeast Asia, Africa, and Latin America. In South Sulawesi, Indonesia, typhoid fever is one of the most important infectious diseases1. The disease is endemic in South Sulawesi throughout the region and is the fourth most frequently infectious disease in 24 districts. In many districts of South-Sulawesi, typhoid is the most important cause of community-acquired septicemia, with a reported incidence rate exceeding 250/100,0002. The prevalence in South Sulawesi is one of the highest in the Indonesian
archipelago; the case detection rate in 1991 was 257/100,000 population which had risen to 386/100,000 population by 2007. Published figures for Indonesia as a whole estimated a prevalence of 358-810/100,000 in 2007, with 64% of enteric fever in 3 to 19 year olds. However, the real magnitude of the problem is difficult to determine. In rural areas where access to diagnostic facilities is limited, there are probably many cases that remain undiagnosed.

Salmonella Typhi (S. Typhi) is the causative agent of typhoid fever. The Gram-negative rod-shaped bacterium is pathogenic only in humans. Infection occurs when water or food contaminated with the pathogen is consumed.

Also, only small proportions of Salmonella enterica serovar Typhi (S. Typhi) exposing individuals to develop typhoid fever symptoms and polymorphisms NOD2, VDR and NRAMP1 genes is novel strategies for the prevention of infection. Previous study revealed that polymorphisms of exon 8 in NOD2 gene; heterozygotes or homozygotes for G/C in codon 2722 were related to susceptibility to typhoid fever in clinical severity.

Facilities to perform this diagnostic test are costly and time-consuming procedures are usually not available in endemic areas. In these problematic situations the serological test can be used to aid the clinical diagnosis. Unfortunately, serological test not too useful in endemic areas since many cases should be positive in healthy persons.

Previous study has suggested that the risk factors for transmission of typhoid fever was not reported among children under five. But, in a community based study performed in the Mekong Delta in Vietnam reported a highest attack rate in children age 5-9 years and lowest for >30 year-old. Therefore the age dependent attack rate of typhoid is controversial. Furthermore, our previous study revealed that severity of typhoid fever have associated with polymorphisms of host susceptibility gene in endemic areas of Indonesia. The aim of this study is to evaluate the validity of extrapolation of the seroprevalence in children may use as a proxy indicator for the level of typhoid fever endemicity.

Materials and Method

Community survey: Two remote rural areas of South Sulawesi (Paitana subdistrict as the high-endemic area and Bantimurung subdistrict as low-endemic area of typhoid fever) were selected for this study. Both are isolated locations with similar characteristics in terms of geographic, socioeconomic, and cultural conditions.

The typhoid fever incidence rate at the time of study was found to be 20.60/1,000 and 8.57/1,000 population in the Paitana and Bantimurung subdistrict, respectively.

The total registered population in Paitana was 1785 and in Bantimurung subdistrict was 1119. The total numbers examined on serology in Paitana and Bantimurung subdistrict were 1699 and 1050, respectively. Tables. 1 show the number and distribution of the population in the two areas according to age and sex. There were no differences in sex distribution among the samples from the two areas (chi-square test with Yate’s correction, p > 0.05). Clinical examination was carried out by experienced medical doctor and confirmed by provincial the internal medicine specialist.

Clinical symptoms and signs are examine for fever, malaise, coated tongue, headache, lost of appetite, relative bradycardia, nausea, muscle aches, apathy, stupor, coma, constipation, abdominal distention, melena, septicemia, intestinal perforation, hepatomegaly, splenomegaly, and jaundice. Children were included in this study from 7 to 12 years old and serology was done by widal test in the field. Diagnosis of typhoid fever was based on the clinical signs and symptoms and Widal test confirmed by blood culture in Molecular Biology and Immunology Laboratory, Faculty of Medicine, Hasanuddin University, Makassar, Indonesia. Blood were taken from subjects for determination of IgM antibodies titers by Enzyme linked Immunosorbance Assay (ELISA).

Serological assay on blood collection: The ELISA assay to determine the seroprevalence according to standard protocol as described previously. Briefly, In-house indirect sandwich ELISAs were established to detect anti-LPS S.typhi IgM. All reagents used were purchased from Sigma unless stated otherwise. Immunosorb Nunc 96 well flat bottomed plates (Thermo Scientific, USA) were coated overnight at 4°C with 100 ml of either 1 mg of antigen/ml in coating buffer (0.1 M carbonate buffer [pH 9.4], antigen positive) or coating buffer alone (antigen negative). Sera were either assayed at a single dilution of 1/250 for anti-LPS IgM S.typhi or serially diluted (starting at a dilution of 1/50).The latter were diluted anti-IgM, 1/2,500) in Tris-buffered saline containing 0.1% BSA and 0.05% Tween 20. One hundred microliters was added to each
well, and the plates were incubated overnight at 4°C. The absorbance at 405 nm (reference filter, 450 nm) was determined using an automated ELISA reader (Reader 270, Biomerieux, France).

For the titration assays, sera were assayed in triplicate (two wells antigen positive and one well antigen negative), and the titer was taken as the highest dilution giving a net OD (mean OD of antigen-positive wells minus OD of antigen-negative well) of more than 0.2 of anti-LPS S.typhi IgM. Six standards were included on each plate, and the OD or titer of the samples was adjusted accordingly. Blank wells with no sera were included to monitor background.

Statistical analysis: All data were recorded on special forms and immediately was performed using a software package Epi-Info, version 6 and SPSS. All tests described used an alpha of 5% and were 2-tailed. The chi-squared test or Fisher’s test statistic is used to compare the results percentage.

Results

Incidence of typhoid fever: At the beginning of the survey 1,785 and 1,119 people were registered in Paitana and Bantimurung subdistrict, respectively. In table 1 shown a total of 1699 and 1050 inhabitants above 12 years (95.18 and 94.01% of the registered population) were clinically examined for signs and symptoms of typhoid fever. During the survey, 35 and 9 typhoid fever were detected among community in Paitana and Bantimurung subdistrict, respectively based on blood culture; 11 and 2 typhoid fever were detected among children in Paitana and Bantimurung subdistrict, respectively. The incidence rate of typhoid fever among community both in Paitana and Bantimurung subdistrict was 20.60/1,000 and 8.57/1,000 population, respectively; while the incidence rate of typhoid fever among children both in Paitana and Bantimurung subdistrict was 35.83/1,000 and 9.30/1,000 children, respectively.

Furthermore, the incidence rate both among community or children between male and female in Paitana and Bantimurung subdistrict was not significantly difference (p>0.05).

Seroprevalence in community and children: Table 1 shows the results of serological examinations. The seropositivity rates for typhoid fever in community in Paitana subdistrict as the high-endemic area were slightly higher than in Bantimurung as the low-endemic area (11.42% vs 4.67%). They were notably higher than the 6.75% found in the low-endemic areas. No significantly difference in seroprevalence was found between male and female subjects both in the high-endemic and the low-endemic areas. Furthermore, the seropositivity rates for typhoid fever in children in Paitana subdistrict as the high-endemic area were slightly higher than in Bantimurung as the low-endemic area (45.60% vs 11.63%). They were notably higher than the 33.97% found in the low-endemic areas. No significantly difference in seroprevalence was found between male and female subjects both in the high-endemic and the low-endemic areas (Table 1) (p>0.05).

Correlation between incidence and seroprevalence rates: Comparison in Paitana subdistrict as the high-endemic area and Bantimurung subdistrict as the low-endemic area on incidence and seroprevalence rates indicate that remained constant correlation (20.60/1,000 vs 8.57/1,000 for incidence rate of community and 11.42% vs 4.67% for seroprevalence rates of community). Also, the incidence and seroprevalence rates in children indicate that remained constant correlation (35.83/1,000 vs 9.30/1,000 for incidence of children and 45.60% vs 11.63% for seroprevalence rates of children).

We have determined the seroprevalence rate in community children both in Paitana subdistrict as the high-endemic area and Bantimurung subdistrict as the low-endemic area in Sulawesi, Indonesia. The high-endemic area in Paitana subdistrict had similar high-incidence and seroprevalence rates both in community and children. The other Bantimurung subdistrict had much lower incidence and seroprevalence rates both in community and children. The correlation coefficient between incidence and seroprevalence rates was 0.98 (Table 1).

Overall, the percentage of percentage of IgM titer in male and female subjects of community both in community and children in Paitana subdistrict as the high-endemic area was found significantly higher compared in Bantimurung as low-endemic area (p<0.05) (data not shown).

a. Probability of difference between Paitana and Bantimurung subdistrict is significant (Fischer exact test, p <0.05)

Discussion

To detect the present and past infection of S. Typhi both in community and children in which typhoid fever is hyperendemic, we applied the ELISA from sera collected both in a community survey in two subdistrict in an area population an area in South Sulawesi, Indonesia. The children survey to determine the incidence of typhoid fever in each subdistrict and compared with their seroprevalence. Also, we examine the community to determine incidence and seroprevalence.

The community of Paitana subdistrict as the high-endemic area constituted an ideal group for assessing the value of serological examination for typhoid fever such as IgM anti-Lipopolysaccharide (LPS) S. typhi antibody by ELISA at the community level, in view of the remarkably high incidence of typhoid fever among the community and children (20.60/1,000 and 35.83/1,000). In contrast, Bantimurung subdistrict as the low-endemic area of typhoid fever was found significantly lower in incidence and seroprevalence rates among community and children compared with Paitana subdistrict as the high-endemic area.

Studies conducted in South Sulawesi, Indonesia suggest that age is related to the appearance of symptoms of typhoid fever, both in primary and secondary infections of variant of S. Typhi and that the occurrence of asymptomatic typhoid fever in a community in a given year leads to the emergence of serious cases in the following years. Therefore, the characterization of typhoid fever and its agents are a very important topic, emphasizing the importance of establishing new diagnostic criteria for this group, since laboratory tests are not always available for diagnosis. Previous study found sero incidence rate 710/100 000 in children 1-15 years old in Pakistan.

In this study found seropositivity rates for typhoid fever in children in Paitana subdistrict as the high-endemic area were slightly higher than in Bantimurung as low-endemic area (45.60% vs 11.63%). This study shows the more seroprevalence of typhoid fever in the remote high endemic areas of Indonesia and suggests the difficulty of diagnosing typhoid fever in children. Further studies on the relationship between the typhoid fever and the children are needed to assess for the true proportion of asymptomatic infections and cases that present diagnostic difficulties in settings with poor diagnostic resources such as the remote areas of Indonesia. However, differences in transmission levels and the characteristics of each region make it difficult to compare these data with our study. Furthermore, environmental condition and sanitation has been determined as risk factor to typhoid fever in endemic areas, Indonesia.

This study discovers the seroprevalence rates of typhoid fever among children in endemic areas, South Sulawesi, Indonesia. This study will help researchers to understand in more detail information on the magnitude and extrapolation of the typhoid problem in endemic areas and it is important for the health services for their planning to prevent typhoid fever.

Conclusion

These results indicate that seropositivity rates among children may reflect the typhoid fever incidence. They
illustrate the potential applicability of seroprevalence as an indicator of the magnitude of the typhoid fever problem in high endemic areas among children.

Clinical Profile and Outcome of Juvenile Autoimmune Hepatitis in Iraqi Children

Mohammad Fadhil Ibraheem

Department of Pediatric Gastroenterology, Hepatology and Nutrition, Children Welfare Teaching Hospital (CWTH), Medical City Complex, P.O. BOX 61023, 12114 Baghdad, Iraq

Abstract

Purpose: The aim of this study was to assess the clinical, laboratory and histopathological characteristics and treatment outcomes in children and adolescents with autoimmune hepatitis (AIH).

Method: The present research is a descriptive study consisting of 19 children and adolescents with autoimmune hepatitis who receive care at the Gastroenterology and Hepatology Department of Children Welfare Teaching Hospital, Baghdad / Iraq from January 2014 to December 2017.

Results: Nineteen children and adolescent were diagnosed with juvenile autoimmune hepatitis during the study period. The presentation was acute in 10 patients (52.6%) and 9 (47.4%) had a chronic type. 15 (78.9%) of them with Type I and 4 (21.1%) with Type II. The commonest presenting features were jaundice, abdominal distension, edema, fatigue, and hepatosplenomegaly. The way of diagnosis depends on an original scoring system of the International Autoimmune Hepatitis Group (IAIHG) compared to simplified scoring system definite AIH was (37.0% versus 79.0% respectively), and probable diagnosis of AIH was (63.0% versus 31.0% respectively). More than two third of patients were treated with prednisone and azathioprine 13 (68.5%), the outcome revealed complete response in 9 (47.4%) and partial response in 5 (26.3%).

Conclusions: The typical characteristics of AIH were: Female sex, type I, a wide range of clinical presentations, treatment using prednisolone and azathioprine turned out to be effective with complete remission in about half of patients.

Keywords: Autoimmune hepatitis, clinical presentation, and outcome, Iraqi children.

Introduction

Autoimmune hepatitis (AIH) is a rare progressive inflammatory hepatopathy, of uncertain aetiology mainly affecting females. The most common features of AIH are increased immunoglobulin G (IgG), the presence of circulating auto-antibodies (Two main forms have been manifested in children: type I associated with antinuclear and/or anti-smooth muscle (ANA/SMA) antibodies, and type II is associated with anti-liver–kidney microsomal antibody type 1 (LKM-1). The proposed target for anti-smooth muscle antibodies in AIH is the actin microfilament, while antismooth muscle antibodies directed to non-actin microfilaments can be found in other situations, like viral hepatitis. The anti-liver–kidney microsomal antibody type 1 is usually directed against cytochrome P450IID6), and a picture of interface hepatitis on histology, in the absence of a known aetiology, which, if untreated, evolves to end-stage liver disease (1-4).

Before the age of two years, AIH is rare, but it obviously increases after that, reaching its maximum between ten and thirty years (5).
Autoimmune hepatitis unless it presents as acute liver failure is responding well to immunosuppression, primarily on the use of prednisolone or prednisolone with azathioprine and is aimed at normalization of immunoglobulin G (IgG), reduction of inflammatory infiltrate within the liver and clinical remission maintenance of aminotransferases at normal levels or not twice higher than the reference value (6-8).

The achievement of therapeutic response occurs in more than two-thirds of the patients, and those who do not respond to treatment and might require urgent liver transplantation (9).

**Materials and Method**

The present article is a prospective study of 19 patients (15 female, 4 male), their age ranged between (3-16 years), presented with AIH and treated between January 2014 and December 2017 in Gastroenterology and Hepatology department at the Children Welfare Teaching Hospital, Baghdad /Iraq. The diagnosis was established according to the revised International Autoimmune Hepatitis Group, published in 1999 (8), and a simplified IAIIHG scoring system published more recently which is better suited to clinical application (10).

All patients were investigated for hepatitis B surface antigen and Hepatitis C virus antibody and it was seronegative. Other possible causes of hepatitis were excluded by using appropriate investigations.

Autoimmune markers ANA, SMA, AMA (titers > 1/20 were positive) and anti-LKM1 (titer > 1/10 were positive), were done by indirect immunofluorescence assay.

AIH was classified into: type I, in case of positive ANA and/or ASMA; and type II, when anti-LKM1 was positive.

Liver biopsy is essential to confirm the diagnosis and to evaluate the severity of liver damage and to guide the treatment decision. It was performed in the pathology department/Gastroenterology hospital/medical city complex. According to liver histopathology, the presence of piecemeal necrosis, lymphoplasmacell infiltrate with a great number of plasmocytes and formation of rosettes are suggestive of AIH (1,11).

**Other Laboratory tests:** 1- Liver function tests [aspartate aminotransferase (AST), alanine aminotransferase (ALT)] reference values were: ALT and AST - 15 to 35 U/L, Alkaline phosphatase, total bilirubin, serum protein, serum albumin, prothrombin time (PT).

2- Serum immunoglobulin concentration (IgG) by radial immunodiffusion technique.

All patients were initially treated with prednisolone (1-2 mg/kg/day; maximum 60 mg/day). It was gradually tapered by 5-10 mg every 2 weeks depending upon the clinical symptoms and AST and ALT level.

A maintenance dose of 10 mg prednisolone continued for two years after improvement, keeping the patient in clinical and laboratory remission. Azathioprine (1-2 mg/kg/day; maximum 100 mg/day) was administered with prednisolone if significant side effects of steroid appeared or an increase in AST or ALT level was observed on tapering the dose of steroid.

All patients were followed up after the end of treatment throughout the period of the study.

And after achievement of remission for a minimum of 2 years, as defined by absence of necroinflammatory activity on a liver biopsy, the absence of clinical symptoms, and normal transaminases, the treatment was discontinued.

Complete remission is considered when transaminase and IgG levels are normal, ANA and SMA are negative or low-titer (<1:20), and anti-LKM1 and anti-LC-1 are <1:10 or negative.

Partial response is considered in subjects whose ALT and AST levels did not normalize up to two years, but decreased compared to the baseline level.

Poor response or unresponsiveness is considered in subjects whose ALT and AST levels did not decrease in the 2-year follow-up period.

Six patients we lost follow their condition and were excluded from the study.

Exclusion criteria: Viral hepatitis, Wilson’s disease, drug induced hepatitis, α1-antitrypsin deficiency, Fatty liver disease and metabolic disorders.

Data were analyzed using Fisher’s exact test on IBM SPSS Statistics version 22.0 (IBM Co., Armonk, NY, USA). The p-value for statistical significance was defined as p<0.05.
The study was approved by the Ethical Scientific Committee of Children Welfare Teaching Hospital, Medical City Complex, Baghdad, and was carried out according to the guidelines of the Helsinki Declaration\(^\text{13}\). 

**Results**

Among 19 patients, 15 were females (78.9%), aged between 3 and 16 years (mean: 8.12 years in type I and 9.13 years in type II) at the time of admission.

According to the clinical findings at presentation 10 patients (52.6%) had acute type and 9 (47.4%) had chronic type.

Among the 19 patients, 15 (78.9%) were classified as having type I AIH, four patients (21.1%) presented type II AIH.

Regarding the main clinical presentations, jaundice was observed in (84.2%), abdominal pain (68.4%), fatigue (63.1%), edema (63.1%) pruritus (52.6%), Bleeding (36.8), Arthralgia (15.7), hepatomegaly (78.9), splenomegaly (47.3), ascites (36.8) and lower limb edema (15.7). Table-2.

We performed liver biopsy, by the percutaneous route prior to starting treatment, except for two patients in whom the procedure was delayed until after the commencement of steroid therapy because of prolonged bleeding profiles.

The main histological features at presentation were: piecemeal necrosis (84.2%), portal tract inflammation (73.6%), and cirrhosis (63.1%).

The diagnosis based on two systems: The International Autoimmune Hepatitis Group (IAIHG) which revealed probable diagnosis in 12(63%) and definite diagnosis 7(37%). A simplified scoringsystem of AIH which probable diagnosis in 5(21%) definite diagnosis in 14(79%).

All patients were initially treated with prednisolone with a starting dose of 2mg/kg/day. Response to treatment was evaluated every 4 weeks. According to liver function tests and clinical status, the dose of prednisolone was decreased by 2.5 or 5 mg every 6-8 weeks and a maintenance dose of 10 mg/day was reached. The mean time to reach the maintained dose was 9 months.

Azathioprine at a dose of 1-2 mg/kg/day was required in 10 patients after a mean time of 3 months (range 1-19 months) following development of steroid toxicity, complications and failure with good outcome and no significant side effects (especially bone marrow suppression).

By the end of 2 years, 9 patients (47.4%) were considered to have complete response (including the patient who submitted to liver transplant), 5 patients (26.3%) were considered to have partial response, 3 patients (15.8%) were missed because of poor compliance and poor response to treatment and 2 patients (10.5%) were died during the course of treatment as a result of hepatic failure. (Table -4).

Discussion

This is the first study from Iraq describing the clinical characteristics of autoimmune hepatitis in children. AIH is an uncommon childhood disease, although the etiology and the pathogenesis of AIH remain largely obscure but the loss of tolerance against autologous hepatic tissue in a genetically predisposed host exposed to environmental factors is involved in development of autoantibodies against hepatocytes\(^\text{13}\). These results were in agreement with other studies in the world\(^\text{14-17}\). However, Miyake et al\(^\text{18}\) reported that male and female had the same frequency of symptomatic concurrent autoimmune diseases and this may be elucidated by the differences in genetic backgrounds.

About half of our patients (52.6%) were presenting with acute hepatitis like illness in the present study. And these findings correlate with the results of the study by Sani M N et al.\(^\text{19}\) Gregorio et al.\(^\text{20}\).

Type II AIH consisting 21.1% of the study population which was compatible with the series of literature data were reported type 2 constitute 8-38% in studies performed in other countries\(^\text{20-23}\).

The wide range of variation in the percentage may be explained by the different genetic backgrounds.

The most presenting symptom (in both types) was jaundice 84.2% and the most common clinical findings were hepatomegaly 78.9%, Splenomegaly 47.3% and ascites 36.8%. These findings are in agreement with what were present in other studies\(^\text{19,20,24,25,27}\).

Regarding diagnosis of AIH by revised original scoring system of the IAIHG compared to simplified scoring system, the performance of the revised original scoring system and the simplified scoring system that performed by Yeoman et al.\(^\text{27}\) found a compatibility between the original revised and the simplified scores for probable or definite diagnosis of AIH (90% and 61%, respectively). Czaja\(^\text{29}\) found a little bit smaller sensitivity for the diagnosis of AIH in the simplified scoring system (100% in the original versus 95% in the simplified). El-koofy N et al.\(^\text{24}\) found the sensitivity of revised original scoring system was (100% versus 88.5%) for the simplified scoring system and the concordance for definite or probable diagnosis of AIH was (38.5% and 19.2% respectively).

In this study an original scoring system of the IAIHG compared to simplified scoring system definite AIH was (37.0% versus 79.0% respectively), and probable diagnosis of AIH was (63.0% versus 31.0% respectively).

The main target of treatment is to induce remission, to reduce or eliminate liver inflammatory process, improve symptoms, and prolong life expectancy, although cirrhosis is present in at least one third of children at the time at diagnosis\(^\text{1}\).
Prednisolone alone or in combination with azathioprine is the cornerstone of treatment. In the present study treatment with prednisolone alone was 6 (31.5%) and azathioprine was added to prednisolone in 13 (68.5%) to reduce the steroid dose because of significant side effects or due to failure in decline of transaminase levels after 2 months of treatment. Both regimens are effective in alleviating the inflammatory process in 9 (47.4%), while 5 (26.3%) had partial response with recurrent relapses, 3 (15.8%) missed and we lost communications with them, and 2 (10.5%) were died during the course of treatment because of hepatic failure and unavailability of urgent measures for liver transplantation.

In comparison with other studies it was better than the results of El-koofy N et al (24) remission of the inflammatory process in 33%, but much lower than those reported in the literature, with a complete response of 65 to 80% (17,28,29) and this may be explained by delay in seeking medical advice and poor compliance in many patients because of prolonged course of the disease, side effects of the drugs, financial difficulties in keeping in touch for follow up especially in families from other governorates.

The mortality in this series of two (10.5%) is similar to the two (8%) reported by Saada et al (23), six (11%) reported by Gregorio et al (20) and two (6%) reported by Maggiore et al (29) of patients.

The Role of 3D CISS MRI in the Evaluation of Primary Trigeminal Neuralgia

Mohammed abd Kadhim1, Rasha Muzahim Rasheed2, Bashar Talib Huweidy3

1M.B.Ch.B., F.I.B.M.S., Professor, Medical college/ Al-Nahrain university, Consultant radiologist, Al-Imamian Al-Kadhimyian medical city/ Baghdad Iraq, 2M.B.Ch.B.Radiologist, Al-Imamian Al-Kadhimyian medical city/ Baghdad Iraq, 3Pediatrics Lecturer in Medical college / AL-Fallujah University

Abstract

Background: Trigeminal neuralgia (TN) is the most common form of facial neuropathic pain characterized by recurrent episodes of unilateral brief electric shock-like pains localized to the sensory supply areas of trigeminal nerve.

Aim of study: to study the role of axial and coronal 3D CISS MRI in the diagnosis of primary TN.

Method: this study is a cross sectional analytic study conducted in the MRI department at AL_Immamain AL_kadimian medical city during October 2017 and August 2018. The study included 30 patients with the clinical diagnosis of unilateral primary TN. Exclusion criteria were secondary cause of TN as brain tumor, MS, and other contraindication of MRI. MRI examination was done using 3 TESLA super conducting system. The patient were examined in the supine position by the following sequences: T1WI sagittal, T2WI axial, T2W FLAIR coronal, DWI, MRA /MIP MRA and 3D CISS (FFE/M) in axial and coronal orientation.

Results: Right and left sided complains represented 63.3% and 36.7%, respectively. Mean complain duration was 2.5±2.4 years. The compression was absent in 1 patient, arterial compression in 18 (60%) and venous compression in 11 (36.7%) patients. Arterial compression was related to superior cerebral artery in 83.3% and anterior inferior cerebral artery in 16.7%. A significant lower mean distance between compression vessels and root entry zone between symptomatic and control sides (p<0.001). The appropriate cut off level for distance between compression vessels and REZ in prediction of primary TN was 3.1mm with 96.7% sensitivity and 96.6% specificity.

Conclusions: The 3D CISS MRI is an accurate imaging technique in diagnosis and evaluation of primary TN. The distance between compression vessels and REZ at symptomatic side is lower than opposite asymptomatic side.

Keywords: 3D CISS MRI, primary trigeminal neuralgia.

Introduction

Trigeminal neuralgia (TN) is the most common form of facial neuropathic pain with an annual incidence of 4 to 5 new patients per 100,000 1. It is characterized by recurrent episodes of unilateral brief electric shock-like pains localized to the sensory supply areas of trigeminal nerve and has been considered as one of the most serious pains that can experience 2. It is usually unilateral, affects older aged group. Occasional reports of bilateral primary TN reflect successive episodes of unilateral pain that move to the opposite side of the face rather than pain episodes that occur simultaneously on both sides 3. Attacks usually last only seconds but may recur repeatedly within short period of time. The attacks are often precipitated by mild sensory stimulation (trigger zones), which may be located anywhere within...
the territory of the affected trigeminal nerve. Typical antecedent stimuli include light touching, draughts of wind, eating, drinking, washing, shaving and applying make-up. The neuralgia tends to occur in bouts over a period of weeks or months, with subsequent spontaneous remission that may last months or years. In time, however, attacks usually become more frequent and the pain more sustained.

Idiopathic or classical TN is mainly caused by neurovascular compression of trigeminal nerve at its root entry zone. In the early 20th century, Harvey Cushing studied the etiology of TN and proposed the hypothesis of mechanical compression, which was further improved by W.E. Dandy by proposing the vascular compression theory in 1932, hypothesizing the presence of arterial compression of the root entry zone (REZ) at the root of the trigeminal nerve. However, TN is not confined to arterial compression at the root of the trigeminal nerve. The causes of pain are complex and diverse. Various types of compression from the offending vessels, including arterial compression, venous compression, or even no neurovascular compression (NVC) have been found in clinical practice.

Three D CISS (stands for Constructive Interference in Steady State), is part of fast gradient echo sequences and considered to be superior to the conventional MRI. CISS is used in the assessment of the anatomical variations and for different pathologies involving the cranial nerves and CNS. CISS has been shown to be useful in spinal imaging too mainly in the cases of AVM. The main roots of trigeminal nerve especially at root entry zone and the gasserian ganglion can be depicted by CISS in the pre-pontine cistern and in Meckel’s cave, respectively. In cases of TN it plays an important role in searching for vascular compressions.

Aim of study: To study the role of axial and coronal 3D CISS MRI in the diagnosis of primary TN.

Patients and Method

This is a cross sectional analytic study conducted in the MRI department at AL_Imamain AL_kadimian medical city /Baghdad /Iraq from October 2017 to August 2018. The study included 30 patients (22 female and 8 male, mean age 54.2 ± 16.5 years) with the clinical diagnosis of unilateral primary TN.

Exclusion criteria: secondary cause of TN as brain tumor, MS, … etc., other contraindication of MRI

All patients were subjected to full history and clinical examination. MRI examination was done using 3 TESLA super conducting system (Achieva 3, Philips medical system, Netherland). The patient were examined in the supine position using maximum gradient capability and circularly polarized head coil, all the patient were examined by the following sequences: T1WI (parameter: TE 4.76ms, TR 232ms, slice thickness 4mm, sagittal orientation, FOV 214mm, matrix 256 X256). T2WI (parameter: TE 80ms, TR 2.8ms, slice thickness 4/1.9mm, axial orientation, FOV 230 mm, flip angle 90). T2W FLAIR (parameter: TE 120ms, TR 11ms, flip angle 90‘ degree, coronal orientation, FOV 230mm). DWI (parameter: TE98ms, TR 4.0ms, flip angle 90‘, axial orientation, slice thickness 4.0/1.0mm, FOV 230mm). MRA /MIP MRA (parameter: TE 3ms, TR 23ms, flip angle 18‘, slice thickness 1.4/-0.7mm, axial orientation, FOV200mm, matrix 256X512). 3D CISS (FFE/M) (parameter: TE 3ms, TR 6ms, slice thickness 1.0/-0.5mm, axial and coronal orientation, flip angle 45, FOV180mm, matrix 512 X512).

Image evaluation was done by two independent radiologists to decrease inter-observer error, NVC considered being present if the CSF fluid amount was severely decreased or not visible between the trigeminal nerve and the aberrant vessels in axial and coronal CISS images, MRA is used to confirm whether the compressed vessels artery or vein, then we measure the shortest distance between the trigeminal nerve on the symptomatic side (at REZ region) and the blood vessels at site of neuro-vascular compression (NVC) (whether the contact is laterally or medially), measured distance for each patient was compared with the contralateral side as a control.

Statistical Analysis: The data were analyzed by Microsoft program and statistical package for social sciences version 23. Outcome of analysis were arrange in scale variables (mean and standard deviation) and in categorical variable. Fisher’s exact test and Independent sample t-test were used for comparison between the categorical data. The level of significant (P value) was set as≤ 0.05.

Results

Thirty patients with primary TN were included with mean age of 54.2±16.5 years; Female to male ratio as 2.7:1. Right side complains represented 63.3% while left sided complain represented 36.7%. Mean complain
duration was 2.5±2.4 years; 23.3% of them had duration of less than 1 year, 70% of them had duration of 1-5 years and 6.7% of them had duration of more than 5 years. The compression was absent in 1 patient, arterial compression was observed in 18 (60%) patients and venous compression was observed in 11 (36.7%) patients. Arterial compression was related to superior cerebral artery (SCA) in 83.3% and anterior inferior cerebral artery (AICA) in 16.7%. Mean distance between compression vessels and REZ at symptomatic side was 2.4±0.5 mm and mean distance between vessels and REZ at control side was 5.4±1.2 mm. All these findings were shown in table 1.

Discussion

Primary TN is a compression syndrome in which one and more division of 5th cranial nerve is affected leading to characteristic paroxysmal facial pain \(^{11}\). Three D CISS-MRI is the appropriate choice in the evaluation and assessment \(^{12}\).

Present study showed mean age of the patients with primary trigeminal neuralgia was 54.2 years with predominance of old age group (≥60 years). This finding is close to the results of Yaseen study \(^{13}\) in Iraq which referred to increased age of patients with primary TN. Females with primary TN were more than males. This was similar to the results of Bee et al \(^{14}\) study in Malaysia which reported high predominance of female gender. Inconsistently, Rai et al \(^{15}\) study in India found that males were more common than females with mean age of 58.9 years. This difference might be attributed to the difference in risk factors for primary TN and difference in methodological inclusion and exclusions criteria. The Current study showed that right sided complain was most prevalent (63.3%). This finding coincides with results of Bangash et al study \(^{16}\) in Pakistan which revealed that 64% of patients had right sided complain. Mean complain duration of primary TN in our study was 2.5 years. This finding is close to results of Cruccu et al \(^{17}\) study in UK which reported mean complain duration of 2.8 years.

In this study, previous history of central nervous surgery was seen in 2 patients with primary TN, Machet et al \(^{18}\) study in France documented that there is an effect of previous history of CNS surgery on development of primary TN.

Zerris et al \(^{19}\) study in USA 3D CISS-MRI could identify accurately 24 (96%) patients. Many authors examined the role of MRI in detection of primary NT and reported a sensitivity of 94–97% \(^{20}\). However, cases with asymptomatic vascular contact were also found to be high, for that, both MRI imaging and clinical evaluation must be used together \(^{21}\). Besta et al \(^{22}\) stated that common advantages of 3D CSSI-MRI were long relaxation times that lead to additional signal, while the main disadvantage was the high cost as compared to conventional MRI.

In this study 3D CISS-MRI reported no vessels compression in 1 patient, 60% artery compression and 36.7% vein compression. Pecker et al \(^{23}\) study in Turkey found that 86% had arterial compression (mainly SCA) while 14% had venous compression. It is believed that compression of the nerve fibers causes hyperexcitability.

The most interesting finding of the present study was the significant difference in distance between compression vessels and REZ between symptomatic side and contralateral normal side (p<0.001), the mean distance was significantly lower among symptomatic side. This finding is in agreement with the results of Lang et al \(^{24}\) study in Germany. Elaini et al \(^{25}\) study in Egypt stated similar findings. In Denmark study conducted by Maarbjerg et al \(^{26}\) similar findings were observed.

The Present study showed that appropriate cut off value for distance between compression vessels and REZ at symptomatic sided was 3.1 mm with sensitivity of 96.7% and specificity of 96.6%. These findings were similar to the results of many studies like Suzuki et al \(^{27}\) study in Japan and Guclu et al \(^{28}\) study in France.

Conclusions

The 3D CISS MRI is an accurate imaging technique in diagnosis and evaluation of primary TN. The distance between compression vessels and REZ at symptomatic side of primary TN is lower than distance at opposite asymptomatic side. Cutoff value in detecting primary TN was 3.1 mm. the compression vessels were arterial more than venous.

Serum Levels of Oxidative Stress Biomarkers in Patients Obsessive Compulsive Disorder in Tikrit City, Iraq

Mohammed Amer Mohammed, Nihad Nejres Hilal, Ahmed Hashim Al Ani

1Department of Biochemistry, Clinical Analysis, Salahdine General Hospital, 2Ass. Prof., M.B.Ch.B.F.I.B.M.S, Department of Pathology, College of Medicine, Tikrit University, Prof., M.B.Ch.B.F.I.B.M.S, Department of Pediatric, College of Medicine, Tikrit University, Salahdine, Iraq

Abstract

Background: Obsessive–compulsive disorder (OCD) is one of the major disabling disorder affecting about 2% of the population, and it causes significant mental health costs. Aim: The purpose of this study is to determine the changes in serum levels of oxidative stress and the role of oxidative stress biomarkers in obsessive compulsive disorder (OCD).

Materials and Method: A cross-sectional controlled study was carried out in Salah Al-din City from 1st of February 2019, to 1st of June, 2019. The number of obsessive compulsive disorder 60 patients whose ages between 18-68 years old. These patients admitted to psychiatric unit at Salah Al-din Teaching Hospital. The control group who were match to the patients studied include 30 healthy control.

Results: The study showed that there is the significant difference between serum level of patients and the control groups. In this study showed that is high level of malondialdehyde (MDA), in patients in compare with control group and lower levels of antioxidant enzymes (GSH-PX, SOD1, CAT) of patients in compare with control group.

Conclusion: We can use serum level of some biochemical markers in compare between patients, and control with OCD. The relationship inverse between MDA and GSH-PX, SOD1, CAT, in patients and control groups.

Keywords: Obsessive compulsive disorder, Oxidative stress, Superoxide dismutase 1, Glutathione peroxidase, Catalase, Malondialdehyde.

Introduction

Obsessive–compulsive disorder (OCD) is one of the major disabling disorder affecting about 2% of the population, and it causes significant mental health costs. Several hypotheses exist regarding the physiological basis of OCD with dysfunction of brain circuits involving the limbic cortex and basal ganglia being at the core of the disorder(1). Indeed, several imaging studies found hyper activity of the orbito–frontal cortex and anterior cingulate cortex(2). Some authors proposed hypotheses involving dysfunction of microcircuits within these limbic loops(3). They provide energy that is released upon reactions with adjacent molecules such as lipids, proteins, carbohydrates, nucleic acids, that develop many diseases(4-5). Free radicals are molecules or ionic atoms with unpaired electrons in their outer shells which have a high reactive ability (5). Oxidative stress is a process that reactive oxygen species (ROS) generation prevails over the antioxidant capacity of cells, which may provoke oxidative damage to major groups of cellular macromolecules (lipids, proteins, and DNA). Malondialdehyde (MDA) is currently considered to the most widely used representative of oxidative lipid damage. Glutathione peroxidase (GPX), superoxide dismutase (SOD1), and catalase (CAT) are also well-established marker of antioxidant enzymes(6) that can reduce the ROS burden and act as antioxidant defense.
Objective of this study, this study was conducted to evaluate serum levels of oxidative stress biomarkers and antioxidant parameter in patients undergoing obsessive compulsive disorder. To measure the change in serum levels of Malondialdehyde (MDA) as a marker of oxidative stress and antioxidant parameters (GPX, SOD1, CAT) in adults patients undergoing OCD and compare these results with that obtained from healthy individuals (control).

**Aim of the study:** The purpose of this study is to determine the changes in serum levels of oxidative stress and the role of oxidative stress biomarkers in obsessive compulsive disorder (OCD).

**Materials and Method**

The study is a cross-sectional controlled study that was conducted on 90 individuals, comprised of 60 patients and 30 controls. Patients were subjected to obsessive compulsive disorder in General Salah Addin Hospital, Salah Addin - Iraq between 1st of February, 2019 to 1st of June, 2019. Patients data were collected and compared with 30 apparently healthy subjects who participated as control group. The levels of SOD1, GSH-PX, CAT and MDA were measured by ELISA technique. A volume of 5ml of blood sample was taken by vein puncture from each subject enrolled in this study. Blood samples were placed into sterile test tubes, after blood clotting, the samples were centrifuged at 3000 rpm for 15 min and the obtained serum were aspirated using mechanical micropipette and transferred into clean plain tubes with screw which labeled and stored in deep freeze at -20°C for the biochemical measurement of MDA, GSH-PX, SOD1, CAT, by ELISA. The principle of ELISA, various antigen-antibody combinations are used, always including an enzyme labeled antigen or antibody, and enzyme activity is measured colorimetrically.

**Normal Value:**
- MDA: 7.813-500ng/ml
- GSH-PX: 2-600U/ml
- SOD1: 0.78-50ng/ml
- CAT: 15.625-1000pg/ml

**Discussion**

Oxidative stress may be an important systemic component of the pathophysiology of psychiatric disorders. In our data-analysis we found a statistically significant global increase in oxidant markers in patients with OCD, similarly to what has been described for other psychiatric disorders(7). Patients with OCD do precipitate with symptoms during acute attack of anxiety and stress. Anxiety may cause secretion of catecholamines which in turn may lead to free radical production through NADPH oxidase(8).

Furthermore, Moreira and his co-authors reviewed that the oxidative stress increased in elderly as a result of a nutritional status which contribute to the decline in the antioxidant ability of the body leading to many consequences such as aging, cardiac diseases and neurological problems(9). Parameters that were used in this study for the assessment of oxidative stress include malondialdehyde (MDA) as oxidative stress marker and three antioxidant indicators including glutathione peroxidase (GPx), Catalase (CAT), and superoxide dismutase 1 (SOD1). Many previous studies reported an inversely correlation between defense antioxidant enzymes SOD1, GPx, and CAT with MDA as a result of their ability to neutralize ROS(10). In our study we are measurement of MDA level in patients in tow groups showed a significant higher level than that of controls that may indicate a higher oxidative stress. This finding is in agreement with Abhijeet Shrivastava et al. who
found a significant difference in MDA levels between of obsessive compulsive disorder (OCD) patients and control\(^{(11)}\).

Malondialdehyde is a product of peroxidation of lipid, and it reflects the extent of tissue damage mediated by free radicals. Oxidative stress thus developed causes peroxidation of membrane lipids, hence further increasing the symptoms of OCD. Lipid peroxidation releases excess malondialdehyde into blood. MDA play a role in OCD and can be a good marker. So, in the our study an attempt was made to find out the efficacy of malondialdehyde as a marker in patients of obsessive compulsive disorder. In patients previously diagnosis(and on treatment), we found decline gradient levels and why it back to take the treatment. Previous studies also had high levels of MDA in patients and lowest levels in healthy controls, these study agree with our studies\(^{(12)}\). The current study revealed that the level of GPx and SOD1 enzymes was significantly lower in all patients’ subgroups “ newly diagnosis, previously diagnosis(and on treatment) patients” when compared with controls, which might indicate a reduction in antioxidant ability of GPx and SOD1 to neutralize reactive oxygen species (ROS) in patients compared to controls. In a similar manner, Abhijeet Shrivastava et al. Have found a significant decrease in GPx in patients with obsessive compulsive disorder (OCD),these results agree with our results.

In recent study, have also found significantly lower levels of glutathione in posterior cingulate cortex in OCD patients in comparison to healthy controls\(^{(13)}\). Both these studies, further strengthen the case for a role of glutathione peroxidase in OCD. The antioxidant enzymes have complementary activities in the antioxidative defense system. In oxidative stress, SOD1, which has central role in defense. We observed lower levels in patients newly diagnosis, and start to increase levels in patients previously diagnosis this response to treatment and become a nearby levels of health(control), which could be attributed to the improvement in the overall health status of the patient in addition to the use of medications and supplements. In the previous study has higher level of SOD1\(^{(14)}\), this studies disagree with our study. CAT this enzyme is considered as one of the antioxidant defense mechanisms against ROS. In the current study, catalase activity showed to significantly lower in patients compared to controls. The level of catalase enzyme activity in patients groups that showed a significant lower level than that of control may indicate an activation of this enzyme as a result of increase in the oxidative stress. This is consistent with the findings by Abhijeet Shrivastava et al. Also agree with E.Ozdemir et al. who described a significant decrease in catalase activity.

**Conclusion**

We can use serum level of some biochemical markers in compare between patients, and control with OCD. The relationship inverse between MDA and GSH-PX, SOD1, CAT, in patients and control groups.

**Acknowledgment:** First of all my deep thanks and gratitude are presented to almighty ALLAH (Glorified and exalted He be) for my success and inspiration in gaining this great opportunity to develop my professional life. The greatest thanks for Ministry of Higher Education and Scientific Research for giving me the chance to get the Master degree from Tikrit University. I share the accomplishment of this thesis with those who gave their valuable time and effort to help me complete this study. This study could not have taken place without the support of my supervisors Dr. Nihad Nijris and Dr. Ahmed Hashim for their invaluable advice, assistance, cooperation, and support throughout the preparing of my thesis. Faithful thanks to Dr. Ibrahim A. Al Sabawy, Specialist of Psych. For helping me in collection of the specimens.

Comparative Study of Lipid Profile in Sedentary and Active Hypertension Population of Maharashtra

Mohammed Salahuddin1, Mohammed Ubaidullah Sayeed2

1Head and Associate Professor, 2Assistant Professor, Department of Physiology, Saudi Arabia, Department of Pathology, College of Medicine, Jouf University, Kingdom of Saudi Arabia

Abstract

Background: 93 active hypertensives were compared with 93 sedentary persons of the same age group, and their lipid profile and BP were recorded to study the prediction cardiovascular disease.

Method: BP was recorded by Diamonds mercury. The serum of the blood analyzed for lipid profile, i.e. total cholesterol, HDL, triglyceride, VLDL, LDL in both groups

Results: Comparative study lipid profile parameter and BP study in both sedentary and active HTN groups were statistically highly significant (p<0.01)

Conclusion: This study highlights the diagnostic and prognostic values for cardiovascular diseases which have a high rate of mortality and mobility.

Keywords: HTN=Hypertension, CVD – cardiovascular disease, lipid profile, BP Blood pressure

Introduction

Dyslipidemia is often observed in a sedentary population associated with Hypertension. Hence, these two major risk factors contribute to an increase in cardiovascular disease globally. The reasons seem to be many and some are associated with an unhealthy diet, stressful and sedentary lifestyle. Stress is also a major contributing factor to cardiovascular disease. The major cause of HTN is dyslipidemia, which leads to risk of cardiovascular disease like coronary heart disease, CCF, ischemic and hemorrhagic stroke, renal failure and peripheral arterial disease. Excessive intake of saturated fats, cholesterol and other sources of calories and subsequent disturbance of lipid profile leading to hypertriglyceridermia and hypercholesterolemia are associated with obesity and consequent hypertension.

Impaired insulin function, increase in peripheral resistance, cardiac output, sympathetic tone and salt ingestion are some responsible mechanisms that lead to morbidity and mortality. Hence lipid profile of active and sedentary was compared and BP of both groups were recorded.

Material and Method

93 active Hypertensive and 93 sedentary group of patients regularly attending OPD of medicine department Government Medical College Hospital Aurangabad (Maharashtra) were selected for study.

Inclusive criteria: Active patients and sedentary patients having variations in blood pressure and lipid profile were included in the study.

Method: Blood pressure of each patient was recorded by Diamond’s mercury sphygmomanometer. Blood samples were collected after an overnight fast of 10-12 hours. About 5 ml of blood was drawn in a dry autoclaved disposable syringe and poured in sterilized plain vial after removing the needle, and allowed to clot, and then centrifuged to separate the serum. The serum was stored at 2-6 °C for a period of 2-3 days in a refrigerator until they were analyzed, lipid profile...
(total cholesterol, HDL, Triglyceride) both groups and recorded separately.

**Exclusion criteria:** Addiction to alcohol and tobacco. Patients on a diet, or having personal or family history of diabetic mellitus, asthma, and tuberculosis were excluded from the study.

**Statistically:** Lipid profile parameters, blood pressure readings were compared in both groups statistically in 2007 Microsoft word computer. The ratio of males to females was 2:1. The duration of study was about 2 years.

**Observation and Results**

**Table 1: Comparison of lipid profile in both active and sedentary group**

Discussion

In the comparative study of lipid profile, in sedentary and active HTN population of Maharashtra, in the study of parameters of lipid profile mean value of (a) total cholesterol sedentary group was 280.6 (SD±0.80), 266.40 (SD±0.68) t test value was 133.3 and p value was significant (p<0.01) (b) mean value of HDL in sedentary group was 33.9 (SD±0.46), 36.6 (SD±0.29) t test value was -47.7 and p value was highly significant (p<0.01). (c) Mean value of triglyceride in sedentary group was 202.9 (SD±0.52) 171.8 (SD±0.58) t test value was 383.1 and p value. (d) Mean value of VLDL in sedentary group was 42.6 (SD±0.36) 36.6 (SD±0.42) t test value was 104.6, p value was highly significant (p<0.01). (e) Mean value of LDL in sedentary group was 207.6 (SD±0.54), 199.4 (SD±0.41) t test value was 115.4 and p value was highly significant (p<0.01) (Table-1)

Comparison of systolic and diastolic BP in both groups.(a) Mean of systolic BP in sedentary group was, 179.4(SD±0.30), 167.1 (SD±0.03) in active HTN group t test was 385.1 and p value was highly significant (p<0.01). (b) Mean of Diastolic BP in sedentary group was 103.0 (SD±0.34), 98.3 (SD±0.36) in active group t test value was 90.4 and p value was highly significant (Table-2) These values were more or less in agreement with previous studies.\(^{(5)(6)(7)}\)

The HDL cholesterol profile the individual from HTN and its consequences the independent protective effect of HDL cholesterol or in risk of coronary heart disease, especially the total cholesterol.\(^{(8)}\) The physical activity and physical fitness have been related to normalcy in lipid profile. Hence physical activity has been described as a lipid lowering antihypertensive, positive inotropic, negative chronostreopic, vasodilating, diuretic, anorexigenic, weight reducing, cathartic, hypoglycemic tranquilizing, hypnotic and antidepressive agents.\(^{(9)}\)

Atherosclerotic heart disease is the leading cause of mortality among patients with chronic kidney disease associated with dyslipidemia\(^{(10)}\) which is mainly due to sedentary lifestyle contributed by intake of unsaturated fatty excessive food.\(^{(11)}\) Thich leads to endothelial damage and triggers an increase in blood pressure which may partially account for its strong predictive power for coronary heart disease\(^{(12)}\) followed by vascular constriction and stiffness.

Summary and Conclusion

The present study of comparison of lipid profiles in sedentary and active hypertensive population will be quite useful to physicians, cardiologists, and bio-chemists and enable them to treat such patients efficiently. Routine monitoring of BP and lipid profiles must be encouraged among such patients. But this study demands further genetic, nutritional, angiological and patho-physiological correlation & study because exact pathogenesis of CHD is still unclear.

Study of Role of Serum Proteins in Viral Hepatitis in Maharashtra Population

Mohammed Ubaidullah Sayeed¹, Mohammed Salahuddin²

¹Assistant Professor, Department of Pathology, College of Medicine, Jouf University, Kingdom of Saudi Arabia,
²Head and Associate Professor, Department of Physiology, College of Medicine, Jouf University, Kingdom of Saudi Arabia

Abstract

Background: 94 Hepatitis A & B groups’ serum proteins were compared with levels of S. Albumin, Globulin and total proteins of control groups to know the prognostic value of jaundice.

Method: LFT, S. Bilirubin, Prothombin time, HbsAg, HBC antibody and IgM, HAV antibody, S. Proteins, S. Albumin and Globulin were studied in the groups of ABCD and controls.

Results: S. Albumin (gm/dl) – Mean value of control group was 4.35 (SD±0.13) 3.75(SD±0.01), t test was 44.08 in group A, 3.29 (SD±0.01), t test was 77.1 in group B, 3.64(SD±0.01), t test was 51.5 in group C, 3.23(SD±0.03), t test was 79.5 in group D and statistically highly significant (p<0.01). Globulin (gm/dl) study of controls had mean value control of 2.12(SD±0.08) 3.22(SD±0.01), t test – 124.8 in group A, 3.60 (SD±0.01), t test – 167.8 in group B, 3.37 (SD±0.01), t test – 141.3 in group C, 3.75(SD±0.01), t test – 185.1 in group D. Total protein mean value in controls was 7.29 (SD±0.05), 6.94(SD±0.01), t test 67.3 in group A, 6.86(SD±0.01), t test 82.4 in group B, 6.99(SD±0.01), t test 57.4 in group C, 6.94(SD±0.0), t test 67.8 in group D and statistically significant p value (p<0.01).

Conclusion: This study highlights the diagnostic and prognostic roles of Albumin, Globulin and total protein levels in patients with Hepatitis A and B.

Keywords: Albumin Globulin proteins, Hepatitis.
Material and Method

Group A- 94 patients of viral hepatitis A having their serum Bilirubin level up to 10mg. Group B - 94 patients of viral hepatitis A with serum Bilirubin level above 10 mg. Group C- 94 patients of hepatitis B having serum Bilirubin level up to 10 mg.

Group-D - 94 patients of hepatitis B having serum Bilirubin above 10mg. Control (Normal) - 94 healthy persons’ serum protein levels were also studied to compare with these groups (ABCD) (total 94*4=376+94 control).

Inclusive criteria – Adults aged between 18-30 years having signs and symptoms of viral hepatitis like abdominal pain, nausea, vomiting, anorexia, fever, icterus and hepatomegaly were selected for study.

Method- LFT, serum Bilirubin, Prothombin time, serological marker HbsAg, IgM, HBc antibody and IgM HAV antibody serum proteins and serum Albumin and Globulin of controls and group ABCD was carried out by Burette method. Percentages of Albumin and Globulin were found out by the Elution method. The amount of Albumin and Globulin was calculated in gram percentage.

Exclusive criteria- Patients having malignancy of liver and HIV positive patients were excluded from the study.

Statistical analysis- Was done in all 4 groups. Obtained results were compared with control group values. The ratio of male to female was 2:1. The duration of study was two years.

Observation and Results

Table-1 – study of S. Albumin (gm/dl) 4.35 (SD±0.13) was mean value of control compared with 3.75 (SD±0.01) t test value was – 185 in group D, the mean value of control group was higher than other group hence value was highly significant (p<0.01)

Table-2 study of Globulin (gm/dl) 2.12 (SD±0.08) was the mean value of controls compared with 3.22 (SD±0.01) t test value was – 124.8 in group A, 3.60(SD±0.01) t test value was – 167.8 in group B, 3.37 (SD±0.01) t test value was – 141.3 in group C, 3.75(SD±0.01) t test value was – 185 in group D, the mean value of control group was higher than other group hence value was highly significant (p<0.01)

Table-3 study of total protein (gm/dl) 7.29 (SD±0.05) was the mean value of control compared with 6.94 (SD±0.01) t test value was 67.3 in group A, 6.86 (SD±0.01) t test value was 82.1 in group B, 6.99 (SD±0.01) t test value was 57.8 in group C, 6.94 (SD±0.01) t test value was 67.8 the statistically p value was highly significant (p<0.01)

Statistically average value of control is significantly higher than average values of Group A, Group B, Group C and Group D (P<0.01).
Discussion

In the present study of role of serum proteins in viral hepatitis in Maharashtra population, four groups of viral hepatitis were compared with control groups - the Albumin (gm/dl) study had mean value of control was 4.35 (SD±0.13) 3.75(SD±0.01) t test value 44.08 in group A, 3.29 (SD±0.01) t test value was 77.1 in group B, 3.64 (SD±0.01) t test value 51.5 in group C, 3.23 (SD±0.03) t test value 79.5 in group D statistically p value was highly significant (p<0.01) in the study of Globulin (gm/dl), the mean value of control was 2.12 (SD±0.08), 3.22 (SD±0.01) t test value was -124.8 in group A. 3.60 (SD±0.01) t test value - 167.8 in group B, 3.37 (SD±0.01) t test value - 141.3 in group C, 3.37 (SD±0.01) t test- 185.1 in group D. All the values were statistically highly significant (p<0.01). In the study of total proteins mean value of control group was 7.29(SD±0.05) 6.94 (SD±0.01) t test value was 67.3, in group A, 6.86(SD±0.01) t test value was 82.1 in group B, 6.99(SD±0.01) t test value was 67.8 in group D. All the values were statistically highly significant (Table-1,2,3) These values were more or less in agreement with previous studies.5(6)(7)

Role of liver in the metabolism of body proteins is illustrated in phases serum Albumin is believed to be synthesized solely in liver, hence hepatic diseases are directly related to variations in levels of S. Albumin, despite inadequate dietary intake. (8) Similarly, alpha Globulin including alpha-1 antitrypsin, glucoproteins, alpha-2 lipoproteins are also synthesized in the liver and Globulin levels are increased in chronic hepatic disease.

Variations in the values of S Albumin, Globulin, total proteins associated with portal cirrhosis with jaundice, edema or ascites are more pronounced.9 (10) The question has been raised that, whether these alterations of serum proteins are the manifestations of hepatic dysfunction or of infection process, because somewhat similar abnormalities have been observed in infectious disease like STD (sexually transmitted Diseases) TB malaria, lympho granuloma venerium.11 Hence precise interactions of serum proteins remains to be clarified.

Summary and Conclusion

Serum protein changes occurring in liver diseases associated with parenchymal damage characteristically decrease in S Albumin and increased in gamma Globulin levels. As viral hepatitis poses a major health care burden. Hence, strategies to be effective controlling the problem to be needed and vaccination has to be mandatory. Virus transmitted through fecal, oral route can be effectively controlled, by hygienic awareness. Infections through blood and blood products require awareness among people. But this study demands further patho-physiological, nutritional, genetic study because the exact pathogenesis of hepatitis is still un-clear.

Vitamin D Receptor Polymorphisms and Correlated with Some Chronic Diseases among Iraqi Women

Nadhim M.H.1, Haider Turky Al-Mousawi1, Nktel Faaz Nassir Al-Saad1, QabasNeamah AL-Hajjar2

1College of Biotechnology, Al-Qasim Green University, Babylon Province, 2Faculty of Pharmacy, University of Kufa, AL-Najaf Province, Iraq

Abstract

The VDR (vitamin D receptor) is one of the key genes that may be associated with the reduced effectiveness of vitamin D. This study was performed to describe the potential role of the VDR genetic variation in with the development of cardiac, arthritis, and urinary tract diseases in patients with vitamin-D deficiency in the Middle Euphrates region of Iraq using PCR-sequencing strategy. Genomic DNA was extracted from eighty of female blood specimens. Then, polymerase chain reaction (PCR) followed by direct dideoxy sequencing reactions were performed. Eight single nucleotide polymorphisms (SNPs) were observed in the VDR amplified fragment, which were distributed amongst the analyzed specimens. Within the observed SNPs, five previously known SNPs were detected, two of them had intronic variations, including rs11574113 and rs11574114, while other three SNPs had synonymous variations, including rs731236, rs765762631, and rs550308645. Whilst, three novel SNPs were identified in the present study, one of them was an intronic variant, g.64366C>T, while the other two variants had synonymous variations, g.64932G>A and g.65214C>T. The most frequent mutation in in intronic part was in urinary tract disease (G>C) (40%) p< 0.01 and cardiac disease (G>C) (25%) p< 0.05. additionally the most frequent mutation in exonic part was in cardiac disease (C>G) and (C>T) both (29%) p< 0.05 and urinary tract disease (C>G) and (C>T) both (23%) p< 0.05. another mutation was obtained in all the control and patients of all diseases (C>T) but it was not significant. Finally out of eight mutations three were novel and five were registered in NCBI website. In conclusion, the present pilot study has provided a practical guide to potentially associate VDR fragment with the progression of desired diseases in the Middle Euphrates region of Iraq.

Keywords: Vitamin D, Polymorphisms, Chronic Diseases.

Introduction

Vitamin D is a steroid hormone with important physiological roles in several organs and tissues. It obtained from foods or by synthesis in the skin after sunlight exposure (Ultraviolet rays) and converted to the active form in the liver and kidneys1. 1,25-Vitamin D₃ (1,25-D₃) is the functional form of vitamin D (Figure 1.1), and known for its role in calcium and phosphate homeostasis. Further, Vitamin D insufficiency has been related with several health consequences, including bone infection, tumor, autoimmune diseases, infectious disorder, type 1 and type 2 diabetes, hypertension, and cardiac disease2.

Figure-1: Vitamin D structure.

It plays an active role in the multiplying and discrimination of different cell type3. Vitamin D cause suppression of specific inflammatory pathways.
and reduces inflammatory cytokine production by human periodontal ligament cells. Suggestions are progressively presenting that vitamin D insufficiency is an unrecognized and communal healthiness problem in several age groups. In addition in different situations like mature medicinal inpatients, postmenopausal women showing with hip rupture, and homebound elderly individuals. However, there is no information accessible regarding the prevalence of Vitamin D insufficiency amongst healthy females in Middle East. Vitamin D shows a main role in renal pathophysiology. Patient with glomerular disorder has a damaged renal filtering barrier, causing proteinuria and decrease the renal function. There duced of renal function may also leads to 1,25-vitamin D3 insufficiency accordingly to decrease renal 1α-hydroxylase effectiveness. Vitamin D management to moderate the proteinuria remains argumentative. Patients with chronic renal disorder are cured with vit-D3 analogs, with the aim to precise the distortion of calcium-phosphorus equilibrium. Therefore, additionally to presence a significance of renal deficiency, it has been theorize that 1,25-D3 insufficiency itself may also cause renal damage. Newly, vit-D3 has been presented to probably assist as a therapeutic cause in RA (Rheumatoid arthritis) patients (Yang J et al. 2015). Infections and autoimmune responses show a central character in RA progress and development, in addition to genetics and environmental reasons. Vit-D can also prevent the production of B-cells and stimulate apoptosis, leads to reduced autoantibody construction due to reduced plasma cell manufacture and antibodies class substituting. Furthermore, vit-D declines auto-reactivity by controlling the pro-inflammatory and antinflammatory cytokines produced by APCs (antigen-presenting cells). Polymorphism of the vit-D receptor (VDR) and 1-a-hydroxylase genes may also conform the susceptibility.

Vitamin D receptor polymorphisms: The VDR gene is positioned in the homo sapiens 12q12-q22 section and comprises more than 470SNPs (single nucleotide polymorphisms), some of which control 1,25 dihydri vitamin D3 approval. The greatest communal variations of the VDR contain rs2228570 variation in exon 2 and rs1544410 variation positioned in the intron13 between exons 8 and 9 (Figure 1.2).

![Figure-2: VDR gene presented all the exons and restrictions recognition sits (14).](image)

Variation of the targets genes transcript was described to have a relationship with vit-D stimulation, through Vitamin-D Receptor (VDR), therefore vitamin D might have an effect at the cell function levels. Valuation of the vit-D receptor gene polymorphism exposed inconstant arrangement including ApaI (VDR 7975232 C>T), FokI (VDR 2228570 C>T), TaqI (VDR 731236 T>C), and BsmI (VDR 1544410 A>G). Among these, particular polymorphisms were described to be linked with diabetes mellitus, arthritis, obesity, cardiac, and urinary tract diseases. A small number of researches have considered VDR gene variations for relations with the possibility of some disorders. Consequently, several researches have considered the genetic factors of this vitamin. Currently investigations in the procedures of important genetic suggestion, assisted to categorize the genetic causes of vit-D ratio and investigate its associations to many disorders. For that reason, recognizing the relationship between vit-D serum ratio and the variations in VDR gene with the happening of some diseases would have significant satisfying suggestions in standard medication.

Materials and Method

DNA extraction: DNA samples were extracted according to the instruction manual that was described by manufacturerers (Bioneer, Korea). The concentration and purity of DNA were measured by a nanodrop (BioDrop μLITE, BioDrop co., UK), while the DNA integrity was checked by a standard 0.8% (w/v) agarose gel electrophoresis that is pre-stained with a higher concentration of ethidium bromide (0.7 μg/ml) in TAE (40 mM Tris-acetate; 2 mM EDTA, pH 8.3) buffer, using a 1 kb ladder as a molecular weight marker (Cat #
The lyophilized primers were purchased from Bioneer (Bioneer, Daejeon, South Korea). The PCR reaction was performed using AccuPower PCR premix (Cat # K-2012, Bioneer, Daejeon, South Korea). The following program was applied in PCR thermocycler (My Genie TM 96/384 Thermal Block, Bioneer, Daejeon, South Korea). The amplification was begun by initial denaturation at 94°C for 5 min, followed by 30 cycles of denaturation at 94°C, annealing at 65°C, and elongation at 72°C, and was finalized with a final extension at 72°C for 10 min. Amplification was verified by electrophoresis on an ethidium bromide pre-stained 1.5% (w/v) agarose gel in 1× TBE buffer using a 100-bp ladder (Cat # D-1010, Bioneer, Daejeon, South Korea) as a molecular weight marker. It was made sure that all PCR resolved bands are specific and consisted of only one clean and sharp band in order to be submitted into sequencing successfully.

DNA Sequencing: The PCR amplicons of Eighty of female patients were commercially sequenced from their forward termini according to instruction manuals of the sequencing company (Macrogen Inc. Geumchen, Seoul, South Korea). Only clear chromatographs obtained from ABI sequence files were further analyzed, ensuring that the annotation and variations are not because of PCR or sequencing artifacts. By comparing the observed DNA sequences of local specimens with the retrieved DNA sequences of VDR DNA sequences (GenBank acc. no. NG_008731.1), the exact positions and other details of the retrieved PCR fragments were identified. The sequencing files of the PCR products of different samples were edited, aligned, and analyzed as long as with the respective sequences in the reference database using BioEdit Sequence Alignment Editor Software Version 7.1 (DNASTAR, Madison, WI, USA). The observed variation in each sequenced sample was numbered in PCR amplicons as well as in its corresponding position within the referring genome. The novelty of the observed SNPs were checked by dbSNP server (https://www.ncbi.nlm.nih.gov/projects/SNP/).

Results

The alignment results of the sequenced samples with the reference sequences had revealed the presence of eight SNPs that were distributed variably in the studied VDR amplicons. The sequencing chromatogram of the observed substitution mutation is shown in (Fig. 4).

The observed SNPs were variably distributed in the analyzed samples. However, the identified SNPs of the present study were divided into two main categories according to their position; intronic variants
and synonymous counterparts. Regarding the intronic variants, four SNPs were identified in the current study, two of them were novel, including g.64366C>T and g.64932, g.64915, while the other two had previously been identified, including g.64915G>C (rs11574113) and g.64978 (rs11574114).

Regarding the synonymous variants, four SNPs were detected too. Three of the observed synonymous SNPs were found to be known previously, including g.65058T>C (rs731236), g.65166C>G (rs765762631), and g.65259 (rs550308645), while the only observed novel synonymous SNP was g.65214C>T. However, no missense SNP was observed in the present study. Thus, the resulting vitamin D3 receptor had no substitution in its amino acid sequences. To summarize all the results obtained from the sequenced 2175 bp fragment, the exact description of the observed variations is listed according to its corresponding position within the NCBI referring sequences as it’s shown in Table 2.

![Figure 4](image-url)  
**Figure 4.** The pattern of DNA chromatogram of the 2175 bpamplicons of the \( VDR \) locus. The observed substitution mutations are highlighted according to its position in the PCR product.

Discussion

This is the first genetic research associated to vitamin D receptor polymorphismsand linked with some kinds of diseases among females in Iraq. There are risingsuggestions of the impact of vit-D in human health; also there are studiesthrough the world to determine its rate and several health influences because of its insufficiency. As the rise of acknowledgment of people in Iraq with the vitamin D3 especially female gender encourage us to study the genetic background about VDR gene and check if there is any defect or mutation that leads to reduce the vitamin D3 level in female body.

Vitamin D insufficiency is becoming an international growing issue. It must not be disregarded, not only because of the totally known significances vit-D insufficiency has on bone health, but mostly as modern researches have presented how the naturally active type of vit-D – 1,25(OH)2D – is implicated in several biological method, comprising immune-system modification. Patients affected through many autoimmune issues presented less rate of vit-D. Though, it is not constantly clear whether vit-D insufficiency is the reason or rather reduced because of the disease\textsuperscript{17}. A Meta-analysis presented that Vit-D may be used for the cure of a number of disorders. It has a biological advantage in skeletal mineralization and increase in phosphorus and calcium serum rates\textsuperscript{18}.

The observed mutations were variably distributed in the analyzed samples. However, the identified mutations of the present study were divided into two main categories according to their position; intronic variants and synonymous counterparts. Regarding the intronic variants, four mutations were identified in the current study, two of them were novel, including g.64366C>T (Non-significant for all disorders) and g.64932 G>A (P<0.5) presented only in urinary tract infections(UTI), while the other two had previously been identified g.64915 G>C (rs11574113) (P<0.5 for cardiac disorder and P<0.01 for urinary tract infection) and g.64978 G>T (rs11574114) (P<0.5 in both cardiac and urinary tract disorders). Regarding the synonymous variants, four mutations were detected too. Three of the observed synonymous SNPs were found to be known previously, including g.65058T>C (rs731236) (P<0.5 for cardiac disorders only), g.65166C>G (rs765762631) (P<0.5 for both cardiac and UTI again), and g.65259 C>T (rs550308645) (P<0.5 for both cardiac and UTI also), while the only observed novel synonymous SNP was g.65214C>T (P>0.5 only in UTI). However, no missense mutation was observed in the present study. Thus, the resulting vitamin D3 receptor had no substitution in its amino acid sequences. In addition there was no mutation correlated with arthritis disorder not from the register mutation or from the novel one.

Conclusion

As a result the polymorphism in VDR gene has no correlation between urinary tract, cardiac, and arthritis diseases with any mutation presented in VDR gene. In conclusion VDR gene has no effect on vitamin D deficiency, decreasing in vitamin D level might be due to less exposure to sun light, also the decreasing in vitamin D level might be due abnormal diet system and In addition also decreasing in vitamin D level might be as a result of effect of some drugs or GMO food.

Estimation of Serum Level of Micro RNA 224 in Different Stages of Hepatocellular Carcinoma

Nady Mahmoud Semeda¹, Hala Ibrahim Mohammed¹, Zeinab Mostafa Saad¹, Wael Soliman¹

¹Tropical Medicine Department, Faculty of Medicine, Minia University

Abstract

Background: Hepatocellular carcinoma (HCC) is the fifth common cause of cancer around the world, and the third common cause of death related to cancer. miR-224 plays an important role in cell proliferation, migration, invasion, and antiapoptosis in HCC by binding to its gene targets. So, miR-224 can be used as an important biomarker for predicting the aggressiveness of HCC.

Aim of study: To evaluate its role in predicting aggressiveness of HCC through detecting its level across different stages of hepatocellular carcinoma.

Method: An observational study, in Tropical Medicine Department, El-Minia University Hospital, El-Minia, Egypt. Patients with hepatocellular carcinoma on top of HCV induced Liver cirrhosis collected among the patients of tropical medicine department from January 2017 to January 2018. Patients were divided into 3 groups according to Barcelona classification of liver cancer (BCLC) into, group 1 with BCLC A, group 2 with BCLC B, group C with BCLC C, and control group of LC without HCC, for all groups: history, examination and routine investigations, abdominal ultrasound, Multislice CT scan and miR-224 assay were done.

Results: There was a significant difference between the level of miR 224 in different stages of hepatocellular carcinoma with the lowest level in BCLC A and the highest level in BCLC C with P value 0.001 indicating its role in predicting aggressiveness of hepatocellular carcinoma.

Conclusion: miR-224 could serve as a good prognostic biomarker for HCC, and can be used as a marker predicting aggressiveness of HCC.

Keywords: LC. Hepatocellular carcinoma. miR–224.

Introduction

Hepatocellular carcinoma (HCC) is the fifth common cancer in men and ninth common in women, however the second common cause of death from cancer worldwide[1]. The occurrence of HCC is highest in those with hepatitis C and hepatitis B related cirrhosis, however even those patients with noncirrhotic hepatitis B virus (HCV) or hepatitis B virus (HBV) are risk for HCC. Patients with cirrhosis, whatever the etiology, are at high risk for the occurrence of HCC[2]. American Association for the Study of Liver Diseases (AASLD) guidelines recommend screening at risk patients for HCC every 6 months with an ultrasound, however other societies recommend α -fetoprotein in addition to ultrasound for increased sensitivity of screening[3]. Those patients who are not found to have hepatocellular carcinoma until symptoms develop have a 0% to 10% 5-year survival, whereas those patients whose HCCs are detected at an early stage have a 5-year survival that exceeds 50% with specific treatment[4]. HCV causes HCC mainly by encouraging continuous inflammation and hepatocyte regeneration as it causes chronic hepatitis and subsequent development of cirrhosis, which can
lead to chromosomal damage and subsequent hepatic carcinogenesis (5).

MicroRNAs (miRNAs), single-stranded non-coding RNAs consisted of 19–25 nucleotides, doing approximately 1% of the human genome, however can regulate more than 50% of all protein-coding genes (6).

miRNAs are important factors in cancer development and progression, miRNAs can work as both tumor suppressors (by binding to oncogenes and inhibiting them) and oncogenes (by binding to tumor suppressor genes and inhibiting them) (7).

Zhang et al. reported that miR-224 possess an important role in cell proliferation, migration, invasion, and antiapoptosis in hepatocellular carcinoma through direct combining to its gene targets (8). Thus, miR-224 thought be a promising biomarker for predicting the aggressiveness of HCC.

**Patients and Method**

**Subjects:** This study included thirty five patients with hepatocellular carcinoma (HCC) on top of hepatitis C virus (HCV) related liver cirrhosis and twenty patients with liver cirrhosis without hepatocellular carcinoma, matched for age and sex to studied group, as control group, all the patients were selected from the visitor to Tropical Medicine Department El- Minia university hospital. All HCC patients were classified according Barcelona classification for liver cancer (BCLC) into Group A: fifteen patients with Bacelona classification stage A (BCLC stage A): single nodule or not more than 3 nodules, their size not more than 5 cm, diagnosed as HCC by 4-phase MDCT, Group B: ten patients with BCLC stage B: multiple nodules with size more than 5 cm with no vascular invasion, Group C: Ten Patients with BCLC stage C: multiple foci with vascular invasion (portal vein thrombosis).

**Blood sampling**

Peripheral blood samples were withdrawn from all subjects under complete aseptic conditions. A total of about 8 ml of blood were collected. 2 ml of blood was withdrawn into an EDTA tube for complete blood picture (CBC) which was analyzed with automated cell counter Sysmex KX-21N (TAO Medical incorporation, Japan). 1.8 ml of blood was collected in a citrated tube (3.2% trisodium citrate) for prothrombin time and concentration (PT and PC) which was evaluated by STAGO COMPACT CT Coagulation Analyzer (Diamond Diagnostics, USA). The last 4 ml of blood was evacuated in a plain tube, left to clot and centrifuged at 3000 revolutions per minute (rpm) for 5 minutes. The serum was then separated and liver function tests (AST, ALT, Alkaline phosphatase, bilirubin, total protein and albumin) were detected immediately using fully automated clinical chemistry auto-analyzer system Konelab 20i (Thermo Electron Incorporation, Finland). The remaining serum was aliquoted and stored at -70°C till used for further assessment of serum AFP, and miR-224.

**Laboratory method:** Serum AFP was determined by EIA kit according to the manufacturer’s instructions using anti-AFP antibodies for quantitative detection of human AFP (EIAab-China).

**Assay of miR-224:** Small RNAs were extracted from 500 L of serum using a miR-PARIS kit (AM1556) according to the manufacturer’s instructions.

**RNA Isolation:** To allow for normalization of sample-to-sample variation in RNA isolation, synthetic Caenorhabditis elegans miRNAcel-miR-54 (purchased as a custom RNA oligo nucleotide from Qiagen) was added (50 pmol/L in a 5 L total volume) to each denatured sample.

**Quantitative Real-Time Reverse-Transcription-(RT-) PCR Assays:** We used TaqMan miRNA probes (Applied Biosystems) to perform qRT-PCR assays according to the manufacturer’s instructions.

- Briefly, 2 L aliquot of enriched smallRNAs from serum samples was reverse transcribed using the Taq-Man MicroRNA Reverse Transcription Kit (Applied Biosystems, San Diego, CA).
- Then 2 L of the cDNA solution was used as template for the PCR stage.
- No-template controls for both RT step and PCR step were included to ensure target specific amplification.
- All reactions were run in duplicate.
- The CT (cycle threshold) (number of cycles required for the fluorescent signal to exceed background level) values of the different samples were compared using the ΔΔCT method (the difference between CT of MIR224 and CT of cel-miR -54).

The relative expression levels of target miRNAs were normalized by cel-miR-54.
Statistical analysis: All collected data were analyzed statistically using statistical package for social sciences (SPSS) program version 20.0 (SPSS Inc., Chicago, IL, USA). The quantitative data were presented as mean ± standard deviation (SD) while the qualitative variables were described as number and percentage. Results were expressed as tables and Figures. Graphics were done by Excel Microsoft Office 2010. Student t-test was used to compare results between groups as regards quantitative data. P-values equal to or less than 0.05 are statistically significant.

Results

Table 1: shows the demographic data of studied groups of patients with HCC and control group of patients with LC:

<table>
<thead>
<tr>
<th>Age in years (mean ± SD)</th>
<th>HCC (n=35)</th>
<th>LC (n=20)</th>
<th>P value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male</td>
<td>52±4</td>
<td>48±10</td>
<td>0.544</td>
</tr>
<tr>
<td>Female</td>
<td>17(48.6%)</td>
<td>8(35%)</td>
<td>0.889</td>
</tr>
<tr>
<td>Female</td>
<td>18(51.4%)</td>
<td>12(65%)</td>
<td>0.887</td>
</tr>
</tbody>
</table>

It was found that the mean age for HCC patients was 52±4, the mean age for control group was 48±10 with no statistically significant difference. (48.6%) were males and (51.4%) were females in HCC group while (35%) were males and (65%) were females in LC group with no statistically significant difference.

Table 2: shows the demographic data of the different three groups of patients with HCC and the group of patients with LC:

<table>

This table shows the Correlations between level of miR 224 and the laboratory parameters in studied groups of patients with HCC and those with LC, There were statistically significant correlations between level of miR 224 and the mean level of AFP, HB, total bilirubin and ALT level (p value 0.001, 0.01, 0.001, 0.001 respectively), however there was no statistically significant correlation between level of miR 224 and platelet count (p value 0.7).

Discussion

Hepatocellular carcinoma (HCC) constitute the fifth common cancer and the second most frequent cause of cancer-related death around the world, with 854,000 new cases and 810,000 deaths per year, constituting for 7% of all cancers. Hepatocellular carcinoma (HCC) make about 90% of primary liver cancers and constitutes a major health problem all around (8), miR-224 is one of the commonly over expressed miRNAs in hepatocellular carcinoma (HCC) (9). The upregulation of miR-224 starts form the precancerous stage and completed throughout HCC development (10).

When evaluating the ability of MiR- 224 in predicting progression and prognosis of HCC, we found that the serum level of miRNA 224 was increased as the tumor grade increase with its lowest level in BCLC A and its highest level in BCLC C, and these results was significant (P value 0.001), denoting the ability of MiR-224 to predict the disease progression of HCC.

These results were consistent with results of(11), who found the same results in their study of 50 HCC patients.
and 20 healthy volunteers, and they found statistically significant difference between levels of MiR -224 in different grades of HCC (P value 0.02) (11).

This also was consistent with the results of (12) who studied One hundred and eighty-two patients. The majority of patients were men and long-term hepatitis B virus (HBV) related cirrhosis. Of the 182 patients with HCC, the serum miR-224 levels were significantly higher in the stage C patients compared with the stage A and B patients (P= 0.005) (12).

In addition we found that the serum level of miR-224 was significantly correlated with Child grading and parameters of liver damage as serum bilirubin, serum ALT and AST. The results showed that serum levels miR-224 showed significant correlation with parameters of severity of liver damage, such as ALT, AST, and bilirubin level (P values were 0.001).

This was consistent with study of (12), who found a significant correlation between level of miR -224 and liver related parameters (ALT, bilirubin level) in their studied patients (p value 0.001), also this was consistent with results of (11), who studied 50 hepatocellular carcinoma patients, and found strong correlation between miR 224 level and liver related parameters such as ALT, and bilirubin level (P value 0.001).

The possible mechanisms might be that liver damage induced inflammation activated inflammatory pathways, such as p65/NF κB. And p65/NF κB is identified as a direct transcriptional regulator of miR-224 expression.

This study was approved by the Institutional Ethics Committee of School of Medicine, Minia University, Egypt, and all patients gave informed consent before participation in this study. The study conducted in accordance with the ethical guidelines of the 1975 Declaration of Helsinki and International Conference on Harmonization Guidelines for Good Clinical Practice.

Histopathological Changes of Mice Immunized by Serratia Marcescens Whole Cell Sonicated Antigens

Nasr T. Mohammed

College of Veterinary Medicine, University of Baghdad/Iraq

Abstract

The research was designed to prepare sonicated antigen of Serratiamarcescens and evaluate its histopathological effect of mice organs which include (liver, spleen, lung and kidney). For this purpose, 24 mice randomly divided into four groups. The first group was immunized with killed whole cell sonicated Serratiamarcescens (KWCSA-SM) (1000 µg/ml) subcutaneously. Second group was immunized with killed whole cell sonicated S.marcescens (KWCSA-SM) (500 µg/ml) subcutaneously. Third group was immunized with whole cell S.marcescens (1000cfu/ml) subcutaneously, 4th group was injected by P.B.S. (pH7.2) as negative control group. Histopathological changes many showed differences between the first group which characterized by severe lesion and other immunized groups, compared with the control group which showed mild lesion in their organs which include severe mononuclear cells infiltration in the interstitial tissue with acute cellular degeneration of epithelial cells.

Keyword: Serratiamarcescens, Antigens, Histopathological changes, Mice.

Introduction

S. marcescens is a species of rod-shaped gram-negative bacteria in the family Enterobacteriaceae. A human pathogen, it is involved in hospital-acquired infections (HAIs), particularly catheter-associated bacteremia, urinary tract infections and wound infections[1]. S. marcescens can cause infection in several sites, including the urinary tract, respiratory tract, wounds[2] and the eye, causing conjunctivitis, keratitis, endophthalmitis, and tear duct infections[3]. It is also a rare cause of endocarditis and osteomyelitis (particularly in people who use intravenous drugs recreationally), pneumonia, and meningitis[4]. S. marcescens characteristics; unique membrane (LPS) as a Gram-negative bacterium, the ability to survive in aerobic and anaerobic conditions, and its motility[5]. Most strains are resistant to several antibiotics because of the presence of R-factors (genes coding for antibiotic resistance) on plasmids[6]. There are many diseases that are associated with S. marcescens: sepsis, bacteremia, meningitis and cerebral abscesses, urinary tract infections, osteomyelitis, ocular infections, and endocarditis[7]. Also, as mentioned in the cell structure, the LPS layer is attached to the outer membrane of the Gram negative bacteria. The LPS acts as an endotoxin (a cell component that is harmless as long as the pathogen remains intact). The release of LPS would over-stimulate the host defenses and cause them to undergo lethal endotoxic shock[8].

The innate immune system initiates host defense against invasive microbial pathogens using specific recognition mechanisms. Here we review the current concepts and the molecular basis of innate immune responses to bacterial infections, focusing our attention on the actors involved in the response to Gram-negative bacteria. Lipopolysaccharide (LPS) is the major virulence factor of Gram-negative bacteria. During the past decade, enormous progress has been obtained in the elucidation of LPS recognition and signaling in mammalian phagocytes. According to the current model, recognition of LPS is initialized by the cooperative interplay between the LPS-binding protein (LBP), the membrane-bound or soluble forms of CD14 and the recently identified Toll-like receptor 4 (TLR4)-MD-2 complex. Recognition of LPS leads to the rapid activation of an intracellular signaling pathway, highly homologous to the signaling pathway of interleukin-1, which results in the release of pro-inflammatory mediators. In vivo models in which animals are challenged with LPS or Gram-negative bacteria have highlighted opposite roles for LBP, CD14 and TLRs. Regarding LPS challenge, there is a large body of evidence in favor of a detrimental role played by LBP, CD14 and TLRs. These molecules sensitize the host to a LPS-induced uncontrolled acute
inflammatory response that results in animal death. However, when the host is in the presence of virulent Gram-negative bacteria, the invading pathogens must be held in check by the innate immune system until a specific immune response is mounted. Under these conditions, LBP, CD14 and TLRs are required to trigger a pro-inflammatory response which is crucial for keeping infection under control. Therefore, caution should be the rule about the development of therapeutic approaches aimed at blocking the pro-inflammatory response during Gram-negative infections. Prodigiosin can trigger a body’s immune system (antibodies and T cells), so it is possible that S. marcescens living in a human body will limit prodigiosin synthesis and hence escape detection by the host’s immune system. Many strains appear to have lost the ability to produce it at all.

Prodigiosin characterized by apoptotic action and the morphological analysis to those cell demonstrated that Prodigiosin induced shrinkage chromatin condensation.

Many other aspects of pathogenicity and virulence of S. marcescens have been studied including adherence and hydrophobicity LPS and extracellular products. This bacterium appears to modes of adherence to host epithelial surface. In keeping with its role as an agent of opportunistic infection, S. marcescens was traditionally associated with low intrinsic pathogenicity. Whilst almost all isolates produce extracellular products such as DNase, chitinase, lecithinase, lipase, gelatinase and siderophores, it appears that in S. marcescens, these products do not act as potent virulence factors. Nevertheless, ongoing studies indicate that S. marcescens may produce other invasive factors. Almost all isolates of S. marcescens secrete a pore-forming hemolysis. The aim of study the histopathological effect of these antigens on body organs.

Materials and Method

1-Bacterial isolation: Serratiamarcescens which was obtained from pathology Unit / College of Veterinary Medicine / Baghdad University and the diagnosis in central public health laboratory was confirmed again according to API-20E system. (to Atlas, 1995)

2-Laboratory animals: A total number 24 mice of both genders which obtained commercially, were adapted for 1 week before started experiment by reared in separated clean and disinfected cages; they were fed on commercial assorted pellets and clean tap water.

3-Antigen preparation: Serratiamarcescens Killed whole cell sonicated antigen was prepared according to Motive (1992) procedure:

1. Bacterial culture on nutrient agar was incubated at 37 ºC for 48 hours to harvest a dense culture of bacteria; the bacteria were examined microscopically after staining with Gram stain to confirm a complete morphology of bacteria.
2. The bacteria was harvested by using PBS (pH 7.2), washed three times by PBS (pH 7.2) and then precipitated by centrifugation at 3000 rpm / 20 minutes.
3. The precipitate was re suspended with formalinized 0.3% PBS solution (pH 7.2); then incubated at 37 ºC for 1-2 hours, after that kept in a refrigerator (4 ºC) over night.
4. The bacterial suspension was washed three times with PBS (pH 7.2) and then precipitated by centrifuge 3000 rpm / 20 minutes and then re suspended with PBS pH 7.2 according to McFarland tube (No. 3) (3x108 CFU/ml) to be used for immunization.
5. The suspension was sonicated by ultra sonicator at 15 KHZ/sec. rate for 30 minutes’ intervals in a cold environment.
6. The sonicated suspension of bacteria was centrifuged at 3000 rpm / 20 minutes; the supernatant was filtered by Millipore filter (0.45µ), subsequent culture on Nutrient agar and blood agar and was microscopically examined to confirm a complete sonication and detected contamination. The suspension was kept frozen (-20Cº) till estimating the protein concentration.

4-The protein concentration of S. marcescens was measured by using Biuret method according to Henry (1974).

5-Laboratory animal (mice) immunization: Twenty-four mice of both sexes were used which were randomly divided into five equal groups (6 animals for each group), as follows:

1. The first group was immunized with 1 ml (1000µg/ml) of KWCSA-SM subcutaneously.
2. The second group was immunized with 1ml (500µg/ml) of KWCSA-SM subcutaneously.
3. The forth group (positive control group) was injected with 1 ml of (1000µg/ml) of KWCSA-SM subcutaneously.
4. The fifth group (negative control group) was immunized with 1 ml PBS (PH 7.2) subcutaneously.

5. At day 10 of immunization blood samples were collected from the direct puncture of the heart by sterile syringes for blood picture.

6. At day 20, 40, 60, blood samples (3ml) were collected from all animal groups for blood picture.

7. At day 60, challenge test was done by *S. marcescens* at dose cfu/ml for each animal orally.

**6-Histopathological examination:** After one week of challenge dose, the samples were collected from vital organs (liver, spleen, lymph nodes, kidneys and lung) of experimental animals: fixed in 10% buffer formaldehyde solution immediately after removal. After 72 hrs of the fixation the specimens were washed with tap water and then processing was routinely done with asset of upgrading alcoholic concentration from 70% to absolute 100% in each concentration; to remove water from the tissues, then clearance was done by xylol, then the specimens were infiltrated with semiliquid paraffin wax at 58°C on two stages, then blocks of the specimens were made with paraffin and sectioned by rotary microtome at 5 mm for all tissue.

All tissues were stained with hematoxylin and eosin stain and the histopathological changes were observed under microscope. (Luna and Lee, 1968).

**Results and Discussion**

**Histopathological changes:** The results showed significant differences in the histopathological changes between immunized rabbits groups and control group that suffer from sever histopathological lesions. As in control group.

In the group that immunized with sonicated *S. marcescens* 1000 µg/ml; The main lesions characterized by marked proliferation of lymphocytes on periarteriolar sheath in the spleen with hyperplasia of bronchial associated lymphoid tissue, in addition to lymphocytes aggregation in portal area and around bile ducts and mononuclear cells aggregation in portal area (Fig1-A)[13].

The immunized group with sonicated *S. marcescens* 500 µg/ml; Histopathological section showed proliferation of lymphocytes in bronchial associated lymphoid tissue,The liver expressed aggregation of inflammatory cells particularly mononuclear cells in liver parenchyma,marked proliferation of inflammatory cells particularly mononuclear cells in portal area and around bile duct.,also the spleen revealed proliferation of lymphocytes in periarteriolar sheath, the kidney shows no clear lesions (Fig-2A)[14].

The group that immunized with whole cell *S. marcescens* 1000 µg/ml only; Histopathological section in the liver shows congested of dilated sinusoids and mononuclear cells aggregation in portal area around blood vessels and hyperplasia of bile ducts with large area of hepatocytes degeneration characterized by foamy enlargement of hepatocytes and coagulative necrosis of hepatocytes with hemorrhage, the kidney shows acute cellular degeneration, the spleen shows depletion of white pulp, while Histopathological section in the lung shows no clear lesions.

The group which was immunized with P.B.S(pH7.2) (control group); Histopathological lesions showed mild lesion in their organs which include severe mononuclear cells infiltration in the interstitial tissue with acute cellular degeneration of epithelial cells.

The immune response influenced by many factors, such as type of the strain and injected antigen. As well as the efficacy of the vaccine to protect the animals against the virulent challenge dose[15].

*S. marcescen* like other enterobacteriacea infiltration in several sites, including urinary tract, respiratory tract and showed acute cellular infiltration in urinary tract and proliferation of lymphocytes in bronchial associated lymphoid tissues.

In the liver, there is proliferation of kuffer cells and mononuclear cells aggregation around central veins. As well as, congestion of the blood vessels and infiltration of inflammatory cells in lumen[16].

*S. marcescens*replicate directly in the mucosa associated lymphoid tissue then disseminated via the mesenteric lymph nodes to liver and spleen, this induce broad immune response inducing cell – mediated, humoral and secretory immunoglobulin A (IgA) antibody response[17].

IFN have increased numbers of IL – 4, IL – 5, IL – 6 secreting cells in peyers patches, and the continued persistence of *S. marcescens*in the infected macrophages results in activation of *S. marcescens*specific Th2 cells and activation of humorl immunity[18].
Ericson and Waldschmidt, 1998 have shown that antibody secretion IgM and IgG and B cells proliferation is enhanced by Th2 clones S. LPs – TLR4 in the kuffer cells signaling plays important role in the generation of both innate and adaptive immunity \(^{[19]}\). The common route of intestinal entry involves M cells, then access to B cells rich peyers patches, B cells phagocyte \(S. marcescens\) upon recognition by the specific Ig receptors (BCR) \(^{[17]}\).

Splenomegaly commonly results from systemic \(S. marcescens\) infection. Although this increase in splenic cellularity is often due to the recruitment of leukocytes \(^{[18]}\).

CD 4 T cells are represent as the specific cells for \(S. marcescens\). Such cells localize to the peyers patches of the small intestine \(^{[19]}\).

**Fig(1-A):** Section in the kidney of animal treatment with 1000 shows severe mononuclear cells infiltration in the interstitial tissue with hyaline cast in the lumen of renal tubules and atrophy of glomerular tufts (H and E stain 400X).

**Fig(1-B):** Section in the kidney of animal treatment with 1000 shows severe mononuclear cells infiltration in the interstitial tissue with acute cellular degeneration of epithelial cells of renal tubules (H and E stain 400X).

**Fig(1-C):** Section in the kidney of animal treatment with 1000 shows mononuclear cells infiltration in the interstitial tissue with pinkish protwnious material in dilated renal tubules and acute cellular degeneration of epithelial cells of renal tubules (H and E stain 400X).

**Fig(2-A):** Section in the kidney of animal treatment with 500 shows severe mononuclear cells infiltration in the interstitial tissue with acute cellular degeneration of epithelial cells of renal tubules (H and E stain 400X).

**Fig(2-B):** Section in the kidney of animal treatment with 500 shows severe mononuclear cells infiltration in the interstitial tissue and around atrophy glomerular tufts of glomerula (H and E stain 400X).
Fig(2-C): Section in the kidney of an animal treatment with 500 shows pinkish material in dilated renal tubules (H and E stain 400X).

Abstract

The process of modern sports training depends on the concentration of objectives for the development of energy production systems and associated functional changes. Since football is also dependent on the anaerobic system because of the high and variety speed, strength in physical performance and planning, so the need to use the trainers and focus on the special exercises and appropriate to the nature of this game, including the system Interval Lactic the importance of research through putting the special exercises in the method of Interval Lactic to improve the level of physical and biochemical players and the schematic action, which contributes to the development of levels of players and enable them to achieve better results in matches. The aim of the study was to: Prepare special exercises in the Interval Lactic method. And to recognize the effect of interval lactic exercises for young footballers. The researchers used the experimental approach and they identified the research population from the Karbala’s players clubs, they chose the randomly specimen which The Karbala Sports Club numbered 20 players, divided to two experimental groups (10) and a Control group of 10 players.

The exercises used by interval lactic method and by (80-90%). The exercises were performed three units a week and were on Saturday, Monday and Wednesday. It lasted eight weeks. The most important conclusions included: The presence of a positive effect of the exercises in the interval lactic method in the development of bearing the performance, LDH enzyme and the schematic action of young footballers. The recommendations confirmed of the need for trainers to use exercises for the dynamic lactic method and their interest in biochemical measurements as indications for the adaptation of organs functional in the body and its impact in the detection of the training situation.

Keywords: Interval Lactic, bearing the performance and LDH enzyme.

Introduction

1-Introduction and Importance of research: the modern sport training depends on concentration of objectives for the development of energy production systems and associated functional changes. Whenever the aerobic or anaerobic of player possibility getting better that’s directly reflect on the physical level, skill and planning performance. This will be achieved by the development of training programs and special exercises based on the development of energy systems related to the game. The football game from the events which a separate activity that requires special physical preparation. It is known that the anaerobic system of energy production is the prevailing system in the football game because of the high speed and strength in physical and skill performance. Therefore, the importance of this research is the need to use special exercises in the interval lactic method to develop bearing the performance of rate of LDH enzyme activity and the schematic action of young football players.

2- The research problem: Through the work of the researchers in the field of football noted that there
is insufficient attention in the physiological side, which reflected negatively on the performance of some players through the low level of performance and the emergence of fatigue, which is due to several reasons, the most important lactic acid, which is disabled for the players in most times, This is due to the lack of good behavior of some trainers in the components of the training load with the times when concentrated lactic acid significantly and not control the active comfort, which plays an important role in the best deal with the lactic and turn it into energy in the absence of oxygen. So the researchers worked on the preparation of special exercises in the interval lactic method to develop the variables investigated may contribute to a relative solution to the problem of research.

3-The Objectives of Research:

1. Preparation of special exercises of interval lactic method to develop the performance, LDH enzyme and schematic action method of young football players.

2. Knowing the effect of exercises of interval lactic method to develop the performance, LDH enzyme and schematic action method of young football players.

3. The special exercises have an effect on develop the performance, LDH enzyme and schematic action method of young football players.

Research methodology and field procedures

Research Methodology: The researchers depend on the experimental design and the design of random equal groups of choice with tribal and remote tests.

The Research population and itself same:
The research population included of the clubs of the holy Karbala governorate for the youth football team numbered (12) club and then the selfsame was chosen by the random way they are the club Ghadrianumbered (20) players represented the selfsame and were divided into two experimental and control groups In a random way too.

Means, equipments and tools used in research:

The personal interview
Test and Measurement
Computer brand (Samsung)
Camera brand(Sony) Japanese-made
Lumbar measuring tape
Medical scale (buerer) made in china
Plastic collars of various heights numbered (10)
Plastic figures, various heights numbered (10)
(2) hand watch brand (kisio610) made in china
Handheld Electronic Calculator Numbered (1) brand (Casio)
(2)Whistle
blood transfusion tubes without material (edta) made in Jordan
(80)Blood extraction syringe
Medical cotton and sterile materials
Medical cooling bag to save blood tubes

3-4 Field research procedures:

3-4-1Determining the variables and tests used in the research: The researchers depends on the survey of many available scientific sources, as well as in the modest experience of the researchers as they are former players and currently trainers. The variables that will be studied in the search for the football game have been determined. Agencies: (bearing the performance, LDH enzyme, and schematic action).

First: the circular performance test (1):

The Purpose of the test: Measure bearing The circular performance of the players

Testing Requirements: football stadium, 10 foot balls, 6, whistle, stopwatch, timer, recorder.

Test Description: This test is in a round shape where the player stands at the middle line on the right and Bounce the ball 30 times then runs along the line of the ball until the player reaches the corner area of the side and plays the high cross ball into the penalty area. Then the player run to the penalty area line which opposite of the goal to get (5) balls on the goal and then go to the tangent line from the left side to do throw to the colleague team and then take the ball from the colleague
team to run by the ball and do Zigzag by the ball between the plastic barrier (cones) and then run the distance of 30 meters.

**Recording:** Calculates the total performance time.

**Show the circular performance test**

**Second: Measure the rate of the effectiveness of the (LDH) enzyme after the effort:** Through the circular performance test above, the researchers measured rate of the effectiveness of the (LDH) enzyme in the blood after the effort through a specialized medical staff assistant by blood draw for all the main sample and after the effort, blood samples were drawn from the players by medical injection by (5CC) of each player of the research sample to measure the (LDH), and the blood was drawn by a specialist medical team of laboratory analysis and vein in the humerus by using the stretcher (Torinke) in the sitting position on the chair, then emptied blood from syringes of keeping blood Tube (TUBES), Bottle-free of (Edta) material anti blood clotting numbered from (1) to (20) each number matched by the player’s name on the registration form. After completing the blood draw and putting it in the tubes, the tubes were kept in a Cod -Box and transferred to the laboratory near of the stadium for measuring the variable Above.

**Third: The schematic action test:** The researchers do two games, one in the tribal test and the other in the dimensional test, the two matches were filmed and presented to the experts * for the purpose of evaluating the players in the test of schematic conduct.

### 3 - 4 - 5 The main experiment

The researchers used the interval lactic method in varying proportions ranging from 60% to 90% applied to the experimental group and the number of training units in one week and three units of Saturday, Monday and Wednesday and eight weeks, which included the curriculum on 24 training unit at the end of the preparation period in addition to each stage of the special preparation and there was a variety in giving the stress between the rise and fall, as for rest periods were (1 - 1).

### 3 - 4 - 6 Remote Measurements and Tests

The two researchers conducted with the assistant working team after the end of the last training unit the remote
tests on the research sample. The researchers were as far as possible to get the dimensional tests under the same conditions as the tribal tests.

**Statistical means:** The researchers used the following statistical means:

1. Arithmetical mean
2. Standard deviation
3. Simple correlation coefficient
4. T test for independent and interrelated samples

The Value T tabular 2,262

Chart (3) shows the preference of the experimental group on the control group in all the tests. Regarding to the circular test that measures bearing the performance, the researchers believe that the main reason for this preference is the practice of the interval lactic method based on modern training method and various training. And oscillating between uprights and land, the nature of these exercises used in the preparation of these exercises and the similarity to large extent, Real playing circumstances with these physical, skilled and schematically training works on ability of develop bearing the performance that is what said (Salman Ali Hassan) : The training process is a construction process works on develop the physical abilities and develop them to achieve the best performance [1 - 2]. Mentioned (Mufti Ibrahim) whenever its closer the exercise circumstances from the competition circumstances (the match) the exercise was more useful for the player and achieve the goals of reaching to the level of match performance [3].

With respect to the test of the LDH enzyme after the effort, the experimental group achieved a preference on the control group in the dimension tests, where the researchers observed that there are significant differences between the two groups and this means that the concentration of the enzyme increased after the Lactik physical effort This increase is due to the anaerobic sugar analysis process, It is known that any
Oxidation process in the body must have a set of factors that help in the process of accelerating the chemical reactions of this process and enzymes are one of the most important protein structures that contribute to accelerate the chemical reactions, ensuring the speed of the necessary energy. (Mohamed Selim and Abdel Rahim) show that enzymes are protein substances of an auxiliary nature that increase the speed of the chemical reactions without being involved in it, which in all living cells in addition to secretion by cells in the bloodstream.\(^4\)

With respect to the third variable, which is the schematic behavior, the researchers attribute this development in the schematically actions of the exercises given to the experimental group, which contributed to the development of the schematic behavior, “the preparation of football players from a schematic side is very necessary and must have the same importance from the coach as well as his share enough”\(^5\). It is also noticeable that the reason of this moral development of the experimental group to the kind of the used exercises, which included many rated exercises by implement the rapid schematic skills, which aims to achieve rapid progress and the direct link between the skills in the implementation and speed of performance. No exercise of schematic skills of the performance and under the similar atmosphere of the real state of playing, the researchers prepared these exercises similar to the state of play and repeat these exercises in the units or training doses used have all developed the time of exercises implementation in the players because the continuation of the application requires them to implement at the minimum time during the game in order to achieve the required goal to put the ball in the competitor goal “Repeating of the schematic exercises are similar to playing in particular can shorten the player’s perception of situations and increase his ability to schematic act quickly”\(^5\).

Abstract

Introduction: The main orientation of hospital as a health services is upholding good governance and improve customer satisfaction by provide the perceived value.

Aims: To analyze the effect of perceived quality and perceived sacrifice to perceived value at Inpatient Installation of Dr. Soetomo Hospital Surabaya, Indonesia.

Method: A cross-sectional observational analytical research with random sampling method. This study was conducted at the Inpatient Instalation Dr. Soetomo Hospital. The sample size of this study was 353 patients determined using Sample Size Determination in Health Studies application. The eligible patients were explained about the study objectives. Approval from patient regarding the participation in the study was obtained by written informed consents. The research instrument used consisted of a valid and reliable closed questionnaire. This questionnaire is used to measure perceived quality, perceived sacrifice, perceived value, and customer satisfaction variables through questionnaire-guided interview. T-test, Multiple Correlation Test (R test), Regression Coefficient with Simulant (F test) was performed to analyze the significant effect from perceived quality and perceived sacrifice to perceived value with p<0.01 were considered significant.

Results: The perceived quality has a positive significant effect while the perceived sacrifice has a negative significant effect to perceived value. Perceived quality and perceived sacrifice variables has moderate relationship with perceived value.

Conclusion: Perceived quality and perceived sacrifice simultaneously have a significant effect on perceived value of the customer at Inpatient Installation of Dr. Soetomo Hospital Surabaya, Indonesia.

Keywords: Perceived Quality, Perceived Value, Perceived Sacrifice, Service Quality, Health Service.

Introduction

Health care industry is one of the important industries with high potential development. Health services industry are currently in a strict and tight competition situation due to globalization with high demands of health service. High and strict competitiveness must be a top priority to win the competition. The number of hospitals that have sprung up and offered superior health services also increase competitiveness between hospitals. The hospital as one of the health services,
should implement competent management values by upholding good governance and improve customer satisfaction as a main orientation in providing health services.¹

Customer satisfaction is a satisfaction or dissatisfaction feeling that felt by the customer after comparing the performance of the product / service received with the customer expectation.² Customers will be satisfied if the health service provider performance can meet their expectations. Customer satisfaction and customer loyalty are influenced by perceived value.³ Perceived value is the difference between the value enjoyed by a customer after using a product, service and cost or sacrifice to obtain the product or service.⁴ The component of perceived value comes from product quality, service quality, price and image or reputation that can shape customer’s perceived value.⁵

The previous study showed that perceived value is influenced by perceived quality and perceived sacrifice.⁶,⁷,⁸ Perceived quality is defined as the customer’s perception of the overall quality and excellence of a product or service that is related to the customer’s expectations.⁹ Further development of perceived quality in the health service is technical quality, interpersonal quality and convenience. Perceived sacrifice is a sacrifice made by a customer in obtaining goods or services.¹⁰

Technical quality showed professional competence, skills and experience of laboratory technicians and physician.¹¹ Interpersonal communication is a face-to-face communication between people in informal social situations to engage in focused interaction by using verbal and nonverbal communication. The process of sending and receiving messages between two people or between a small group of people with multiple effects and some instant feedback.¹² Facilities relate to physical appearance of health facilities, physical appearance of officers, and medical and non-medical equipment.¹³ Facilities include time, place and procedure, physical environment conditions, place of service (comfort, safety, safety, or admission procedures). This facility also includes the internal environment of the hospital. Perceived sacrifice can be monetary (non-monetary) and negative factors (negative experience, waiting time, mental and emotional stress).¹⁴

The aim of this study was to analyze the effect of perceived value and perceived sacrifice to perceived quality at Inpatient Installation of Dr. Soetomo Hospital Surabaya, Indonesia.

Material and Method

A cross-sectional observational analytical research was carried between October 2017 – December 2017 at the Inpatient Installation Dr. Soetomo Hospital, Surabaya. The study protocol was approved by Ethics Committee of Dr. Soetomo Hospital (313/PANKE/IV/2017). Population of this study was all patients in Inpatient Installation Dr. Soetomo Hospital, Surabaya. Determination sample size in accordance with the strata of Inpatient Installation using software or the Sample Size Determination in Health Studies application (Sample Size 2.0). Based on the calculation results obtained 353 patients for sample size. Prior to the study, the eligible patients were explained about the study objectives. Approval from patient regarding the participation in the study was obtained by written informed consents. The research instrument used consisted of a valid and reliable closed questionnaire. This questionnaire is used to measure the effect perceived quality and perceived sacrifice to perceived value variables through questionnaire-guided interview. All data was analyzed using Statistical Package of Social Sciences (SPSS) 17.0 for windows was used and p values <0.01 were considered significant. T-test, Multiple Correlation Test (R-test), Simulant Regression Coefficient (F-test) were performed to analyze the significant effect from perceived quality and perceived sacrifice to perceived value.

Results

The perceived value has a positive significant effect while the perceived sacrifice has a negative significant effect to perceived quality (Table 1). The multiple correlation test showed perceived quality and perceived sacrifice variables has moderate relationship with perceived value (Table 2). Perceived quality and perceived sacrifice simultaneously have a significant influence on perceived value (Table 3)

Table 1. T-test result of perceived quality and perceived sacrifice to perceived value at Inpatient Installation in Dr. Soetomo General Hospital 2017.

Discussion

Perceived value can be achieved in the health service industry depends on the health provider’s commitment to provide a good service. Good health provider service will be able to achieve customer value. The quality service must cover various aspects such as administrative services, doctor services, nurse services, pharmaceutical services and nutrition services. Perceived quality was an evaluative assessment given by the customer for good superiority of service performance. Perceived quality was not the actual brand or product quality, but the customer’s assessment of service as a whole.

The relationship between perceived quality and perceived value showed a positive and significant effect. The perceived quality provided by the Inpatient Installation of RSUD Dr. Soetomo can affect and influence the perceived value of customers. The higher the perceived quality, the higher the perceived value of the hospital’s customers. Perceived quality of a service or product will affect the perceived value of the customer. The perceived value showed that overall assessment is based on the benefits and sacrifices of the health service customer.

The customer sacrifice can be described as perceived sacrifice. The perceived sacrifice in this study consisted monetary and non-monetary aspects. Perceived sacrifice felt by customers at the Inpatient Installation of Dr. Soetomo was difficult to accept in both monetary and non-monetary terms. These results lead to a significant negative influence between perceived sacrifice and perceived value that means the higher perceived sacrifice will decrease perceived value of the hospital customer. The higher customer sacrifice then the customer feels the perceived benefits decreased. Perceived quality and perceived sacrifice simultaneously have a significant influence on perceived value. This is consistent with the previous studies that showed perceived value was influenced by perceived quality and perceived sacrifice.

Conclusion

Perceived quality and perceived sacrifice simultaneously have a significant effect on perceived value. The perceived sacrifice has a negative influence or opposite direction toward perceived value, so that the higher the perceived sacrifice will decrease the perceived value or perceived value of the customer at Inpatient Installation of Dr. Soetomo Hospital Surabaya, Indonesia. Further study is needed and can be done to provide empirical evidence about other factors that affect perceived value.

Reduction and Fixation of Orbital Floor Fracture Using Trans-Antral Balloon Technique: A Case Report

Aly Gomaa¹, Khaled Barakat²

¹Assistant Lecturer of Oral and Maxillofacial Surgery Department, ²Professor and Head of Oral and Maxillofacial Surgery Department, Faculty of Dentistry, Minia University

Abstract

Orbital floor fracture is considered as a major function and aesthetic challenge for maxillofacial surgeons. The emergence of endoscopic controlled techniques in reducing this type of fractures has gained popularity in the last few years. Here we present a case of orbital floor fracture, accompanied with zygomatico-maxillary complex (ZMC) fracture that was treated through intraoral incision using trans-antral balloon. The fractured orbital floor was accessed and reduced through the underneath antrum under endoscopic control and was temporarily supported using Foley catheter balloon. This technique seems safe easy and feasible technique for reducing orbital floor fracture.

Keywords: Orbital floor fracture, endoscopic reduction, Foley catheter, sinus fracture, maxillofacial fracture, fracture stabilization.

Introduction

Orbital wall fracture commonly occurs in patients with facial trauma, and its incidence ranges from 18% to 50% of all cases of maxillofacial trauma (1, 2). Fractures occur mainly in the orbital floor, with the medial wall as the second most frequent location of orbital fractures (3). Orbital wall fractures are explained by a hydraulic mechanism of injury and present themselves when a blunt object, which is of equal or greater diameter than the orbital aperture, strikes the eye. The globe usually does not rupture, but the resultant force is transmitted throughout the orbit causing a fracture of the orbital floor, being the weakest part of the orbital framework (4). These blowout fractures result in changes in the bony orbital dimensions which can affect the function of intraorbital contents (2, 5). Signs and symptoms of orbital floor fracture can vary greatly, ranging from being asymptomatic with minimal bruising and swelling, to severe affection, with diplopia, enophthalmos, hypophthalmia, and hypoesthesia of the cheek on the affected side (4).

The objective of surgical treatment of an orbital fracture is to anatomically restore the orbital soft tissue content and orbital walls to their positions and in that way, restoring the shape and volume of the orbital cavity (6, 7). The classic treatment method consists of approaching the floor through transcutaneous or transorbital incision, accurate repositioning of the bony fragments and herniated orbital contents, spanning defects with autogenous or synthetic graft that can restore the orbital volume, and rigid fixation to restore the orbital framework. The key to successful surgical repair using such technique is the adequate exposure and proper visualization of the posterior bone shelf (4, 8, 9). However, this technique does not exempt from complications and limitations. Beside being technically sensitive, transcutaneous incisions through lower eye lid carry major esthetic and function risks. Ectropion, scleral show, canthal malposition, and prolonged swelling are among those risks (10, 11). In addition, reassembling of the bone fragments and performing internal fixation using metal plates and screws is not always feasible due to the thin orbital wall, the narrow surgical field, and the possibility of orbital tissue damage (6).

In order to overcome some of these limitations and complications, a new simple technique was introduced for restoring orbital floor fragments and fix them temporarily using a balloon introduced through the
underneath antrum under endoscopic control\textsuperscript{(12, 13)}. The technique involves trans-antral access to the orbital floor through anterior maxillary osteotomy or through the concurrent anterior maxillary wall fracture which provides a route for releasing herniated tissue and reducing the floor under endoscopic visualization\textsuperscript{(14)}. Afterwards, a Foley catheter is introduced through the antrum and inflated to temporarily support the reduced fragments. This technique omits the need for permanent hardware support and allows for reducing the orbital floor through the same intraoral incision used to manage the concurrent zygomatico-maxillary complex (ZMC) fractures\textsuperscript{(12, 13)}.

Herein, we present a case of orbital floor fracture in combination with concurrent ZMC fracture that was treated through intraoral route using trans-antral-balloon technique.

**Materials and Method**

A 28-year-old male patient was referred to oral and maxillofacial surgery department, Minia University, with chief complaint of right eye swelling and inability to open mouth widely after motorcycle accident. Clinical examination revealed, right periorbital ecchymosis, subconjunctival haemorrhage, right enophthalmos, and limited range of vertical mandibular movement. CT examination showed right orbital floor fracture with herniated periorbital tissues, right zygomatico-frontal (ZF) suture fracture, and maxillary sinus wall fracture (Fig. 1). Fundus examination was done by ophthalmologist and revealed healthy internal ocular tissues. Patient was treated under general anaesthesia using nasotracheal intubation. The anterior maxilla was approached through right hemi-maxillary vestibular incision. The ZF suture fracture was approached through right upper blepharoplasty incision. The ZF suture fracture was first reduced and temporarily fixed followed by zygoma reduction. Through the anterior maxillary fracture, a 30\textdegree endoscope (4.5mm, 18cm) was introduced in the right antrum to visualize the fractured orbital floor. Using periosteal elevator, the herniated periorbital tissues was released and pushed back into the orbital cavity. Plating of the ZF suture took place thereafter. Then, under endoscopic control, a 12 F Foley catheter was inflated with saline to support the reduced bony fragments of the floor (Fig. 2). Afterwards, the anterior maxillary sinus wall was reduced and plated. The outlet of the catheter then, was tied and cut just beneath the vestibular incision. The incisions were closed and patient was extubated.

**Results**

Visual acuity and ocular motility were checked postoperatively. Patient was on oral antibiotic regimen for 1 week, while the Foley catheter was left in place for 2 weeks. No post-operative complications related to the catheter were noted during this period. CT scan were taken while the catheter in place to check for floor reduction stability (Fig. 3). Afterward, the Foley catheter was deflated and removed uneventfully on office-based settings without the need for local anaesthesia and again, the visual acuity and ocular motility were re-checked.
Figure 2: Intraoperative image of the Foley catheter balloon after inflated with saline to support the reduced orbital floor before plating of the anterior maxillary sinus wall fracture.

Figure 3: Postoperative CT. (A): Axial view of the reduction and fixation of right maxillary sinus fracture. (B) and (C): Coronal and sagittal views of reduced and temporarily fixed orbital right orbital floor. Note the tube of the Foley catheter “arrow”.

Discussion

Orbital floor fracture is a frequently encountered fracture in maxillofacial trauma field which presents major aesthetic and function challenges. This type of fracture was classically treated through extraoral incisions\textsuperscript{15}. However, with the evolution of endoscopic-assisted techniques in the field of maxillofacial trauma surgery, techniques of reducing orbital floor fracture, among other maxillofacial fractures, were subjected to continuous developing in order to enhance the safety and aesthetic outcomes\textsuperscript{1, 6, 12}. Here, we presented a case for reducing orbital floor fracture through the same intraoral incision used to reduce the concomitant ZMC fracture. The major advantage of this technique is the elimination of the need for transcutaneous incision, which minimizes complications, preserves the integrity of lower eye lid, and reduces operative time. Reducing the herniated periorbital tissues under endoscopic magnification through the antrum provides more safe technique to the optic nerve in contrary to intra-orbital dissection conducted during classic transcutaneous incisions\textsuperscript{8}.

The utilization of Foley catheter balloon as a temporary fixation for the reduced orbital floor provides many advantages. Beside being cost effective, easy, and simple fixation technique, the balloon can be easily adjusted by inflating or deflating the saline to support bony fragments\textsuperscript{12}. In addition, the balloon also supports the bony fragments of anterior maxilla from inward migration toward the sinus. The patient was on antibiotic regimen till the end of fixation and no foreign body reaction was noticed in our case till deflating the balloon. However, the elasticity of the balloon has its limitations as it can be perforated by screws, needle, or sharp bony fragments. Hence, caution should be considered during applying bone screws and during closing the wound.

In conclusion, the result of this case report is encouraging, and it seems that this technique provides a simple, safe, and cost effective method for reducing and fixating the orbital floor fractures accompanied with ZMC fracture through the antrum utilizing the same intraoral incision under endoscopic control.

Determination of Some Human Enzymes Activities in Presence of Titanium Oxide Nanoparticles

Amer Hasan Abdullah¹, Manal Sadiq Hammoodi², Emad Mahmoud Eltayef³, Abeer H.M. Safaryan⁴

¹Assist. Prof., Ph. D., ²M. Sc., ³M. Sc., ⁴Assist. Prof., Ph. D., Chemistry Department, Science Collage, Mustansiriyah University

Abstract

Titanium oxide nanoparticles (TiO₂NPs) are the most common particles that have industrial, commercial, medial and antibacterial applications. On the other hand, they have toxic properties within some concentrations that show the ability to inhibit some human enzymes. In this study a diluted solutions of TiO₂NPs were prepared by weighting (0.08 gm) with deionized water as (10⁻¹, 10⁻², 10⁻³, 10⁻⁴, 10⁻⁵) with low conductivity to avoid interaction with other ions. Our study aimed to estimate the effect of different concentration of TiO₂NPs on liver enzymes aspartate transaminase (GOT), alanine transaminase (GPT), alkaline phosphatase (ALP) and Amylase in human serum by using a healthy human serum with a mixture of enzyme solution in absence and presence of diluted solution of TiO₂NPs. The results showed that different TiO₂NPs concentrations used had inhibitory effect on all the enzymes. With TiO₂NPs high concentration solutions the activity of enzyme decreased, inversely and the efficiency inhibition ratio increase. The kinetic properties of enzymes in presence of TiO₂NPs solutions had been studied as well. Different concentrations of substrate used to study type of inhibition. The study illustrated that there is a competitive inhibition in GOT and ALP enzymes, while there was uncompetitive inhibition in case of GPT and Amylase enzymes. Transmission electron microscope (TEM) technique was used to describe the two dimensional picture for the structural changes of the molecule, evaluate the nature of the studied NPs and particle size.

Keywords: Inhibition, TiO₂ nanoparticles, Enzyme, Kinetic.

Introduction

Nanotechnology is a set of techniques to manipulate the material that aims to obtain materials with new functions and improved properties. Among the different materials, nanoparticles have specific role in various applications. Several studies showed the toxic effect of TiO₂NPs and they showed that the toxicity mechanism occurs mainly through oxidative stress which damages carbohydrates, lipids, protein and DNA. Moreover, the pathological changes occurs in liver tissue could be caused by deposition and accumulation of nanoparticles in this tissue (¹).

Many researches stated that exposure to metal oxide nanoparticles induced reactive oxygen species (ROS) generation and subsequently caused oxidative stress (²-⁴).

While another study tested titanium nanoparticles acute toxicity in vivo in mature rats and their effect on different times on hepatic parameters, liver, kidney, and lung tissues. They stated nanoparticle accumulation of the in the liver, kidney, and lung tissues and elevated levels of liver markers GOT, GPT and ALP. Correspondingly, they observed apoptosis, hepatic fibrosis, hepatic necrosis, pneumonia, renal glomerular inflammation and pulmonary thrombosis (⁵).

Also M. Doudi and M. Setorki in their experimental study on Wistar rats hepatic enzymes, concluded that if nanometer spherical-shaped TiO₂NPs used for medical purposes even in small amounts they will cause cell toxicity (⁶).
Although, extensive researches achieved on TiO$_2$NPs applications in tumor therapy, drug and gene delivery to the cells and tissues and labeling cells and macromolecules$^7$, but there is a lack in studies reporting their toxicity or side effects on cells and animals in vivo.

There are a lot of disadvantages for TiO$_2$ nanotechnology. Titanium dioxide nanoparticles as a toxic, carcinogenic, and light-sensitive substance were described by the Scientific Organization for Consumer Protection (SCCS)$^8$. The nanoparticles of titanium dioxide have two crystal shape (anatomical and rutile)$^9$. They are effective and light toxic in their interaction with the reactive oxygen species (ROS) in the presence of ultraviolet light$^{10}$. Different experiments have been performed on rats by giving different intake amounts of TiO$_2$ nanoparticles. The negative effects of these doses have been diagnosed and they had showed that it caused apoptosis and/or oxidative damage, accompanied by reactive oxygen species excessive production and lipids, proteins and DNA peroxidational with antioxidant capacity significant reduction$^{11-13}$. To identify TiO$_2$NPs hazard in a laboratory test of terrestrial invertebrates, Drobne et al.$^{14}$ evaluated each of weight change, feeding parameters, mortality and catalase and glutathione-S-transferase activities after dietary exposure and concluded that the response to soluble chemicals is different from that to nanoparticles therefore results should be processed differently. In other word, the response to TiO$_2$NPs exposure can be defined as the threshold of the minimum amount of feeding.

In our study we choose four enzymes to evaluate mainly; Glutamate oxaloacetate transaminase (GOT) enzyme EC(2:6:1:1) which is hydrolase enzyme called transferase that act as a catalyst to transfer amino group from aspartic acid to α-ketoglutarate, GOT enzyme mainly diagnose heart and liver diseases$^{15,16}$. Glutamate pyruvate transaminase (GPT) enzyme EC(2:6:1:2) is an enzyme that transfer amino group from alanine amino acid to α-ketoglutarate, GPT enzyme mainly diagnose liver and diseases$^{15,16}$. 

α-Amylase (1,4-α-glucanglucanohydrolase) enzyme EC(3:2:1:1) is the primary digestive enzyme, acting on starch, glycogen and present in plants and animals. α-Amylase found in pancreas, parotid serum and urine, it is elevated in variety of surgical, traumatic and neoplastic diseases$^{17}$.

Alkaline phosphatase (ALP) enzyme EC(3:1:3:1) found in several tissues throughout the body, elevated levels of ALP are most commonly caused by liver diseases and bone disorders$^{15,16}$.

**Materials and Method**

**TiO$_2$NPs Solution Preparation:**
Titaniumtetraisoperoxide (TTIP) was dissolved in absolute ethanol and in terms of molar ratio deionized water was added to the solution TTIP:H$_2$O(1:4); while to adjust the pH nitric acid (5%) was used. The solution was vigorously stirred for 60 min at room temperature in order to form solutions. The solution was left for 24 hour to transform to a gel to obtain nanoparticles. The gel was dried under 80ºC for 2 hours to evaporate water and subsequently calcined at 450 ºC for 2 hours to obtain desired TiO$_2$NPs$^{12,18-20}$.

Atomic force microscopy (AFM) was used to determine the physical properties of TiO$_2$NPs such as shape and size.

**Determination of Enzymes Activity:**

\[
\text{L- Aspartate} + \text{α-Ketoglutarate} \xrightarrow{\text{GOT}} \text{Oxalic acid} + \text{Glutamate}
\]

\[
\text{Alanine} + \text{α-Ketoglutarate} \xrightarrow{\text{GPT}} \text{Pyrurate} + \text{Glutamate}
\]

\[
\text{Starch} \xrightarrow{\text{Amylase}} \text{Maltose} \xrightarrow{\text{Glucosidase}} \text{Glucose}
\]

\[
\text{Phenyl phosphate} \xrightarrow{\text{ALP}} \text{Phenol} + \text{Phosphate ion}
\]

Concentrations of (1×10$^{-1}$, 1×10$^{-2}$, 1×10$^{-3}$, 1×10$^{-4}$, 1×10$^{-5}$) M were prepared from a stock solution of (0.1M)-TiO$_2$NPs by diluting with deionized water, the conductivity of the solution was (0.25°C/m).

The activity of all the enzymes in presence of TiO$_2$NPs was measured in human serum by using (Bio system kit) method of these enzymes with replacement of (100µL) buffer solution with (100 µL) of TiO$_2$NPs solution.

The inhibition percentage was evaluated by comparing the activity in presence and absence of TiO$_2$NPs under the same conditions according to the equation:

\[
\%\text{Inhibition} = 100 - \frac{\text{Activity in the presence of TiO}_2\text{NPs}}{\text{Activity in the absence of TiO}_2\text{NPs}}
\]
B-A constant concentration of TiO$_2$NPs (10$^{-1}$ M) were used with different substrate concentrations of (10, 20, 30, 40, 50) mM for GOT, GPT Amylase and ALP enzyme to study the inhibition type. Different substrates concentrations of these enzymes were prepared by using buffers. Using Lineweaver-Burk equation, the enzymes activities were determined in presence and absence of TiO$_2$NPs by plotting 1/V against 1/[S], and the values of $K_m$, $V_m$ and type of inhibition were estimated.$^{(20)}$

**Results and Discussion**

**TiO$_2$NPs characteristics:** Atomic Force Microscopy (AFM) of TiO$_2$ nanoparticles, demonstrated that they having spherical shape with diameter (90.36) nm. AFM images of material nanoparticles in which is irregular and randomly distributed TiO$_2$ NPs, can be seen with max value of 10.000-90.000 nm respectively exhibit morphology with (RMS) root mean square roughness off (1,70) and for (2.410) in nitric acid at 450°C as in (Figure 1)$^{(23)}$.

![Figure (1): Atomic force microscopy(AFM) for TiO$_2$NPs](image)

The AFM charts for TiO$_2$ NPs agreement with those reported in literatures.$^{(2,7)}$

**Enzyme activity:** The study illustrates effect of TiO$_2$NPs on some liver enzymes (GOT and GPT) and hydrolysis enzymes (α-Amylase and ALP) activities.

Table (2) show the relation between α-Amylase and ALP activities and TiO$_2$ nanoparticles concentrations, when nanoparticles concentration decrease from (10$^{-1}$) M to (10$^{-5}$)M enzyme activity decreases from (3.77) to (1.1) for α-Amylase enzyme,(3.84) to (2.67) for ALP enzyme.
The study shows that even diluted TiO$_2$NPs solutions still had inhibitory effect on enzyme with less percentage in vitro.

The inhibition average value was decreased (50.57% to 36.41%) for GOT, (38.78% to 29.37%) for GPT, while Amylase and ALP enzymes inhibition was (34.27% to 26.27%) and (14.40% to 11.18%) respectively.

Tables (3) illustrate the kinetic variables of ($K_m$ and $V_m$) and type of inhibition, where shown its (competitive) inhibition to GOT and ALP enzymes, and (un competitive) inhibition to GOT and $\alpha$-Amylase enzymes as shown in figure (2) by using Lineweaver – Burk equation.

Where $K_m$ 33.3, 25, 66.7, 113 and $V_m$ 20, 9.1, 6.7, 10 for GOT, GPT, ALP, $\alpha$-Amylase enzymes respectively.

TiO$_2$ NPs inhibited enzymes activities mainly caused by enzyme protein denaturation, when NPs interact the functional group in the active side of enzyme that cause denaturation, or caused by the acidic solution of TiO$_2$ NPs, where the negative charge of the enzyme proteins with NPs that have positive charge that cause denaturation and inhibition in enzyme activity.

Creating Value by Service Experience to Increase Health Service in hospitalized South Sulawesi Hospital, Indonesia: A Literature Review

Armin¹, Alimin Maidin², Indahwaty Sidin², Fridawaty Rivai², Burhanuddin³, Muhammad Safar³, Risnah⁴

¹ Doctoral Program Science of Public Health, Hasanuddin University, Makassar, ²Siwa Regional Public Hospital, South Sulawesi, Indonesia, ³Department of Hospital Management, Faculty of Public Health, Hasanuddin University, ⁴Makassar, Faculty of Public Health, Hasanuddin University, Makassar, ⁵Department of Nursing, Faculty of Health and Medicine, Alauddin Islamic State University

Abstract

Background: Service experience are personal psychological environment and feeling experienced to service. Service experience will influence value of the service especially in health service. Understanding the value of service experience can increase health service in hospital.

Objective: The aim of this study were to understand about the role of customer experience in the main marketing phenomenon.

Method: Phenomenology.

Result: Consumer service experience influence their valued for health service. Service experience were driven by factors of service environment, employee service, comfort of service, and hedonic service.

Conclusion: Some dimensions of service experience were very important for improving services in hospitals.

Keyword: Service experience, Health service, Hospital.

Introduction

Facing the increasing pressure on the health sector like the introduction of new technologies and the development of economy globally has also affected the hospital sector. This requires hospitals to adopt modern management. Modern hospital management systems must provide services that focused to customer. Hospital must be able to understand the needs, desires and expectations of customers and create value in providing services to achieve satisfaction of customers and be able to survive competition.¹

Over the past few decades, experience has become a central phenomenon that appeals to researchers and service managers. Since the idea emerged that consumer behavior has an experiential dimension.² Academics and practitioners recognize that need for more deep understanding about the role of customer experience in the main marketing phenomenon.³ Quality improvement is not a miraculous thing, but is a command and control in organizational evolution from the previous traditional conditions to better forms of management. It is conducted with high performance approaches to improve the design and management of organizational.⁴ As one example of maximizing health care, a model of predicting drug adherence. systemic therapy can help to identify a high risk of noncompliance among patients.⁵

Objective: The aim of this study is to understand about the role of customer experience in the main marketing phenomenon.

Types of studies: Phenomenology

Outcomes: This study outcome created value by service experience to increase health service in hospitalized.

Result

Climate service a companies have been defined as sharing perceptions about policies, practices, and
The empirical model was developed to examine the direct and indirect role of equity service experience, relationship equity, brand equity, and customer satisfaction. The results show that service experience is driven by four factors. Factors of service experience are environment service, employee service, comfort of service, and hedonic service. Customer experience dimension are sensorial, emotional, cognitive, pragmatic, lifestyle, relational. While according to Kim et al., (2011) that the Customer Experience are environment, benefits, convenience, accessibility, utility, incentive, trust. Other study result show that the hotel brand image and customer dissatisfaction to staff performance are related to guest experience and it will influence on marketing decision making for managers.

### Discussion

**Service experience:** The service experience are a psychological environment of personal reactions and feelings experienced by customers when consuming services. Service experience also defined as consider the experience and subjective responses of customers direct or indirect contact with companies.

Voorhees et al (2017) define that service experience is as the period of all service encounters or service meetings that relevant to core service offerings that affect the customer.

![Service Experience Diagram](image)

Customer experience is the product of interactions between organizations and customers during their relationship. This interaction consists of three parts: customer travel, brand contact points that interact with customers, and the environment.

**Service experience dimension:** Service experience can be seen in several dimension: Berry et al (2006) report that there are three dimension that to be clues for customers to percept in their every experience when they receive service. It is functional clue, mechanic clue, and humanic clue.

**Functional clues:** Functional clues concern to technical quality. Functional guidance is “what” of service experience, reveals its reliability and service competency. Showing or suggesting the technical quality of the service exists or does not exist is a functional guidance.

**Mechanic Clues:** Mechanic Clues come from the actual object or environment such as scenery, smell, sound, taste, and texture. Mechanic clues concern to the presentation of sensory services and functional clues concern to service reliability.

**Humanic Clues:** Humanic clues arise from the behavior and appearance of service providers, words choice, voicetone, enthusiasm level, body language, neatness, and appropriate clothing. Humanic clues is “how” of service experience revealing about the commitment of an organization to understand and satisfy customer needs and wants. According to Otto and Ritchie (1996), service experience dimensions include hedonic, interactive, novelty, comfort, safety, and stimulation.
Customer experience dimension is experience that consists of involving and entertaining dimensions based on active or passive participation from customers throughout the enjoyment process has been found to be a source of motivation, customers get a strong feeling of pleasure, such as shopping pleasure.11

Mood: Retail environments that affect the mood of customers in creating customer happiness and unforgettable experiences was observed.

Free time: Relaxing activities, the results of shopping become pleasure, pleasure and freedom that is felt.

Special: In a study of fashion shops found that the design and environment of the store gave a unique personality to the store and created a perception of authenticity, solidity, enthusiasm and inconvenience.

Customer experience Dimension by Kelly et al (2010) include climate service a companies, creativity, empathy, Anticipation, Structural empowerment, Adaptive service offering have been defined as sharing perceptions about policies, practices, and procedures that are related to customer service.12

The empirical model was developed to examine direct and indirect role of equity service experience, relationship equity, brand equity, and customer satisfaction. Study results shown that service experience is driven by four factors its are service environment, employee service, comfort of service, and hedonic service.13

Customer Experience Dimension by Gentile et al: Customer experience dimension are sensorial, emotional, cognitive, pragmatic, lifestyle, relational. While according to Kim et al, (2011)14 in the Customer Experience are environment, benefits, convenience, accessibility, utility, incentive, trust.15 Dimensions of service quality that are important by Parasuraman et al., (1985) such as access, communication, competence, courtesy, credibility, reliability, responsiveness, security, tangibles, understanding/knowing customers.16

Exploring several dimensions from several researchers is recommended to develop dimensions or instruments to measure service experience in hospitals. Review clues of management are functional clue, mechanic clue and humanic clue.10 Increase organization understanding can develop and grow the ability of workers to adjust customer satisfaction. The perceived service climate has a greater impact on the recognition of customer needs, while empowerment has stronger strength the effect on the creation of alternatives.19

Helkkula A et al (2012) reported that four theoretical propositions that describe the value in experiences, The First is the value in the experience is intra specific and socially inter subjective. The second is value in experience can be loved and imagined. The third values in experience are built based on past, present, and imaginary future experiences in nature and the fourth is the value in experience arises from one by one to determine the social context.20 other study shown that managerial relationships of service experience, combining dimensions of experience to more functional services.5

Organizational culture has become important links to improve performance in both of the manufacturing and service sectors. There is significant relationship between the patient safety culture and several dimensions of hospital performance.21 This study does not provide insight into specific ways that culture can be strengthened as well in this study focuses on US hospitals and it can’t be generalized to health systems in other countries.

Stimpfel AW, Sloane DM, Mchugh MD, Aiken LH found that there was significant relationship between the introduction of magnet and a better treatment experience for patients.22 The characterization concepts of service experience a). Phenomenological service experience related to values discussion at dominant logic of service and interpretive consumer research. b) Service experience based on process (it related with understanding service as a sequential process). c). Results-based service experience (which is related to understanding service experience as one element in the service model that connects variables or attributes to various results.24

Frame of exchange service is better to understand how values and experiences are evaluated. The method is a conceptual approach integrating two research streams. The research stream are consumer culture theory and dominant service logic. The author expands the context of experience by implementing a service ecosystem perspective and identified social and cultural factors that influence experience from system context: An expanded context system, Multiplicity of structures and institutions, value-in-cultural context, and co-construction context.17
Study in the Western of Delhi report that most restaurant get a positive score, especially in terms of having fun and enjoying a restaurant. Restaurant able to meet customer expectations that make customers more willing to share experiences with others and return to the restaurant once again. But at the same time customers are not satisfied because they think that they are not learning something new they want to learn.25

Other study result shown that service experience must be managed appropriately by small and medium enterprises (SMEs) operators by collecting and evaluate relevant data regarding customer experience. Service design must be done holistically. The ways that are embedded in the service provider’s organizational culture by using tools such as “Blueprinting” Synergic collaboration and learning areas among traditionally fragmented tours. Service providers are important for achieving long-term competitiveness.26

Conceptualization of the behavior role in customer engagement shared value creation in multi-party service systems. Customer behavior: First, the formulation of behavior envisions customers using their resources to extend and add to company offers. Second, Co-developing behavior sees customers donating resources such as knowledge, skills and time to facilitate the development of focal company offerings. Third, Affecting behavior is associated with customers who use their resources and skills to influence other. Mobilizing behavior is referred to customers who use resources and time to mobilize other.3

Service research has traditionally concentrated on understanding, measure and optimize delivery of core services. Service experience as the period in which all service meetings relevant to core service offerings may occur. The concept consists of pre and post-core meetings. The meeting was built into core service provision as “moments of truth” which affects customer results. We see service experience by highlighting the future, core and post-meeting services. The period also provides an approach to regulating existence and the future research on service experience. This widespread view makes it easy research not only at individual service meetings in single language period, but also on the dynamics of customer experience throughout this period.9

This study in meeting casino services found that the conceptualizes customer equity replace equity value by postulating service experience equity. An empirical model was developed for ensuring the direct and indirect roles of service experience equity, relationship equity, brand equity, and customer satisfaction with loyalty results. The results show that the service experience is driven by four factors in first-order dimensions environment service, employee service, convenience service, and hedonic service.13

The factors of improving service experience in hotels are service quality, service delivery; component, hotel atmosphere, quality of staff and facilities, experience quality, and aesthetic quality. The study results show that the hotel brand image and customer dissatisfaction with staff performance are related to guest experience and it will influence on marketing decision making for managers.8

Study was conducted by Aiken, L. H (2012) reported that from the study of hospital work and patient safety, satisfaction, and service quality in European hospitals as reported by both nurses and patients all countries faced hospital quality, safety, and nurse fatigue and dissatisfaction problems. In all of countries, staff of nurse and quality of hospital working atmosphere is significant related with patient’s satisfaction, quality, and safety of nursing. Quality of hospital working including managerial support for harboring good relationship between doctor and nurse, nurse participation in making decision, and organization priority in nursing quality.18

The group of patients tested in the geriatric ward did not show anxiety levels. Generally: patients are satisfied, very happy with the provisions of the hospital and behavior of staff. Factors are related patient’s satisfaction: Friendly medical staff, Friendly non-medical staff, Procedure for receiving smoothly, Information about daily routines, the choice of menu varies, Ordinary cooking, Privacy, Comfortable furniture, Recreational facilities, Attractive decoration, A smooth acceptance procedure, and adequate provisions for visitors/visits.27

**Conclusion**

Some dimensions of service experience were very important for improving services in hospitals. Consumer want development of health service in hospital are accordance with the service experience dimensions of consumer. Service experience dimension are accordance with almost all of the Bugis ideology which is the majority of customer in South Sulawesi. So that in the future this research will develop models that are suitable for Bugis culture.
Limitations: This article has several dimensions of experience but does not cover all dimensions in Bugis culture in health services

Recommendation: So that in the future exploration creating value is in accordance with local wisdom, especially government hospitals in southern Sulawesi. In South Sulawesi, majority of customer is Bugginess. So, Bugis tribe in the future are expected to have a model of creating value based on the Bugis philosophy to improve the equity of health services.

Investigation of Infectious Stages of Intestinal Parasites and Fungal Spores which Contaminated Nails of Some Students in Tikrit University, Iraq

Ashraf J. Mahmoud Zangana¹, Ruaa H. Latef Dunia A. Huseen¹

¹Department of Biology, College of Education for Women, University of Tikrit, Iraq

Abstract

The study included collection of nail swabs in 119 subjects; three slides from each person selected randomly to determine the infectious stages of intestinal parasites and fungal spores that polluted it. The samples were stained with lougiodine and collected samples from some students of Tikrit University / Salah ad Din governorate from October 2018 until the end of January 2019. The results showed; the number of positive cases was 44 with 36.974%. Three intestinal parasitic stages were recorded, Entamoebahistolytica, Giardia lambelia, Toxocaracanis and two fungus, Microsporumcanis and Microsporumnanum. Where the infection rate of E.histolytica where proportion of 59.09%, and the least cysts of parasite G. lambelia 11.36%. The fungal spores recorded a higher ratio with M. canis with 15.90% percentage and the lowest of M. nanum with 9.09%. Interference overlaps with single, double and triple contamination was recorded in parasitic and fungal contaminated nails. The results showed that the highest percentage of nail pollution of students nails of College of Education for Women, where it reached 40.74%, followed by percentage of pollution of students of Faculty of Management and Economics college and college of Agriculture and the College of Law will continue 38.09%, 35.29%, 33.33% respectively and the lowest was 27.77% of students of Education for pure sciences. The percentage of a pollutant in female fingernails is higher than that of male fingernails where it reaches 39.72%, 32.60% respectively.

Keywords: Infectious stages of intestinal parasites, fungal spores, nail pollution.

Introduction

Intestinal parasitic infections have spread and caused a decline in level of health in different age groups, especially in underdeveloped societies. Diseases caused by pollution of infectious pathogens of human pathogens. There are four main species that infect humans and cause them “common and dangerous diseases, eg, infection with infectious stages of: Cryptpsporidium spp.; GG. lambelia; Cyclosporo; oyetonesis. Intestinal parasites cause global health problems, especially intropical and subtropical regions that play an important role in transmitting these pathogens and thus constitute an important epidemiological factor for disease transmission. These pathogens can contaminate vegetables and fruits in a number of ways. They can be found in soil where these plants are grown or in animal faces used for fertilization or in water used for watering, they can be found by the workers in these plants or in the water. Used in washing or also possible pollution occurs during transport or storage of these plants. Skin fungus is an intrusive organism and is almost mandatory for human intrusion Alone or on man and animal together and has the ability to produce Enzymes decomposition of the horns and its exploitation as a source of nutrition. And classified these fungi are based on the properties of their compositions resulting from the non-sexual reproduction to three Genus Epidermophyton, Microsporum, Tichophyton, but it later emerged that some of the fungus genotypes Microsporum. Tichophyton possessed the ability to be sexual reproductive. Nail fungus is a common fungal infection and is often transmitted among people in wet areas, swimming pools and other wet areas. It is common
The results obtained were spp. Giardia lamblia, Toxocara canis, and stages were recorded: Entamoeba histolytica, Giardia lamblia, Toxocara canis, Microsporum canis, Hymenolepis nana, Ascaris lumbricoides, Taniidae spp., Trichostorongelussspp.. The study aimed to identify the infective stages of intestinal parasites and contaminated fungi of some. Tikrit University students, and to study the percentage of the spread of these pollutants for students and both sexes.

**Materials and Method**

**Places and duration of sample collection:** Samples were collected from some students of Tikrit University / Salah ad Din Governorate for the period from October 2018 until the end of January 2019.

**Type of samples and method of collection:** 119 students were randomly collected from University of Tikrit by conducting direct swabs from the nails and by three replicates per student, as follows:

1 ml of the normal saline solution was applied to the nail to remove the ova, larvae, cyst, oocyst and parasitic parasites, Then a drop of the sediment was taken by loop and placed on the glass slide and pigment dye, And then the glass slide was loaded and then the slides were scanned with a light microscope under the magnification force of 100x and 40x and the parasitic and fungal phases were identified. The results showed that the highest percentage of parasitic infections was in the gastrointestinal stage of E. histolytica, where it reached 59.09%, the lowest of which was G. lamblia parasite. The infection rate was 11.36%, whereas the fungal spores had the highest infection rate of M. canis (15.90%). The smallest was M. nanum And 9.09%. Overlap cases were recorded with single-infection parasitic and fungal infections under study in fingernails and double and triple (Table 1). The infection of intestinal parasites transmitted by soil is one of the most common infections in the world, and it is generally a serious health problem, which is transmitted through eggs and parasitic cysts in human faces that pollutes the soil in areas suffering from the deterioration of health services and hygiene and impact On 1.5 billion people, or 24% of the world’s population, are infected with parasitic infections transmitted by soil and distributed to the tropical and subtropical regions. Toxocara eggs were the second in terms of contamination of infectious parasitic pathways, and perhaps because female worms put 10,000 eggs a day and are resistant to environmental conditions and this result matches what the researchers recorded. In recent years, there have been cases of infection due to food contamination of intestinal parasitic pathways, The pollution of hands, vegetables and fruits plays a role in the transmission of these pathogens and therefore constitutes an important epidemiological factor for the transmission of diseases, such as: Giardia lamblia, Entamoeba histolytica, Enterobius vermicularis, Hymenolepis nana, Ascaris lumbricoides, Taniidae spp., Toxocara spp., Trichostorongelussspp.. Recorded 14 cases of dermatofungus in Portugal during 10-year period, with Taenia urbrum being the most common, with a prevalence of 50%, followed by infection by Microsporum canis 11%.

The results showed that the highest percentage of infection of nails of some students of Tikrit University under study was for students of College of Education for women with percentage of 40.74%, followed by percentage of pollution to nails of the students of Management and Economics college, college of Agriculture and Law College, with 38.09%, 35.29%, 33.33% respectively, And the lowest was 27.77% for students of college of Education for pure Sciences (Table 2). The percentage of infection in female fingernails was higher than that of male fingernails, which reached 39.72% and 32.60%, respectively (Table 2). This may be due to the extension of some girls to their nails, leading to the accumulation of pollutants from pathogens and other causes of contact with polluted soil, water or contaminated food.

in people who put their hands and feet in the water such as housewives and cooks.

People who suffer from nail fungus are often patients with immune system problems and nail fungus that usually begins with the nail and the skin and finger fungus causes itching, cracks, peeling and foul odor. The nail fungus often develops at the base of the nail and is accompanied by irritated red and inflamed skin. As the fungus evolves, the nail turns darker, yellow and thicker than usual, and the nail area becomes more sensitive and painful and loses its transparency. The study aimed to identify the infective stages of intestinal parasites and contaminated fungi of some. Tikrit University students, and to study the percentage of the spread of these pollutants for students and both sexes.

**Results and Discussion**

The total number of samples taken from nail swabs was 119 swabs and three replicates were randomly selected to identify parasitic and fungal infections. The results showed that the number of positive samples was 44 with 36.974%. Three infectious parasitic stages were recorded: Entamoeba histolytica, Giardia lamblia, Toxocara canis, and two fungal buds are Microsporum canis and Microsporum nanum (Table 1).

The Significance of Vimentin and Matrix Metalloproteinase-9 in Oral Squamous Cell Carcinoma in Relation with Tumor Depth and Prediction of Lymph Node Metastasis in South of Iraq

Aws Rassul Hussain Al-Salih

Assistant Professor, Head of Pathology Department, College of Medicine, University of Al-Qadisiyah

Abstract

Objective: To evaluate the early diagnostic value of Vimentin and Matrix metalloproteinase-9 biomarkers immunohistochemistry depending on tumor depth in oral squamous cell carcinoma.

Materials and Method: Forty-five paraffin wax blocks of malignant squamous cell in oral cavity were funded retroactively. An immunohistochemical staining was proceeded using anti-Vimentin and anti-Matrix metalloproteinase-9 monoclonal antibodies.

Results: The mean age of patients was 55.67±15.45, male affected more than the female with male to female ratio 1.5:1, 50% of tumors were located in tongue, (53.33%) presented as mass. more than half of the cases were well differentiated squamous cell carcinoma (51.11%), (26.66%) had lymph node metastasis, and (33.33%) of the patients were in disease stage II. Tumor depth revealed statically significant relation with lymph node involvement (P=0.036), and (57.78%) showed tumor depth more than 7mm. Both Vimentin and Matrix metalloproteinase-9 revealed significant positive correlation with depth of invasion, lymph node metastasis and stage of disease. There was a patent positive interconnection between Vimentin and MMP-9 (P=0.034).

Conclusion: Both proteins expression offers exalted rate of lymph node hitting, deeper tissue invasion and worse speculation.

Keywords: OSCC, Vimentin, MMP-9, Tumor depth, Immunohistochemistry.

Introduction

Occurrence rate of oral squamous cell carcinoma (OSCC) is evaluated to be more than 300,000 cases annually all over the world[1]. Management of OSCC be based on the clinical tumor-node-metastasis (TNM) tabulation[2]. Eminent clinical value in patient with OSCC is the early diagnosis of the disease prior hosting vague lymph node, so these patients would profit from salubrious neck dissection[3]. Various tumor countenance has been offered to assist in foretelling which patients have inscrutable lymph node involvement at diagnosis, such as gene exhibition subscriptions[4], tumor bottom[5] and “worst pattern of invasion”[6].

With regard to tumor depth (TD), there is no uniform method for researchers to measure the TD until now. TD is considered to be a more reliable feature, as many studies have shown that the risk of metastasis and spread to cervical LN increases with increase in TD, it is agreeable to suppose that the extreme offensive tumors are those with the substantial capability to expand downwards to the deepest area[10]. Epitheliumtomesenchymetransformation (EMT) has been obviously perform a crucial function in neoplasm infliction and metastasis Matrix-metalloproteinase-9 (MMP-9), a 92 kDa gelatinase, has a clear function in cancer infestation and angiogenesis[15]. And it expected to be involved in the aggressiveness of many tumors. It is believed to give rise to type four collagen declination[16]. MMP manifestation raise a probability for local recrudescence, and lymph node and far metastasis. High MMP-9 manifestation was linked with the series of lymph-node dispersal which is related with undesirable prognosis[17]. The survival proportion in OSCC is affected by the matter of fact that diagnoses happen mostly in delayed grades of the disease. Thus, the intent of this project was to
Materials and Method

A whole of 45 retrospective wax embedded tissue blocks of fully excised OSCC were obtained pro- and retrospectively from the dossiers of maxillofacial and pathology labs, Al-Diwaniyah Teaching Hospital, Basra Teaching hospital, Al-Samawa Teaching hospital, Al-Nasiriyah Teaching and several private pathology labs in southern Iraq from (2014 – 2018). Four μm thick segments were deduct and hematoxylin and eosin slides were suitable for histopathological reevaluation by two experienced pathologists, Figure (1). The clinical data consisted of age, sex, site, clinical presentation; tumor grade, stage and LN status were identified from surgical and pathological reports of the patients. Tumor Stages were carried out according to WHO classification schema, while tumor grades were established as follows: Grade I (well differentiated), Grade II (moderately differentiated), and Grade III (poorly differentiated) [1].

Statistical Analysis: Numeric variables were showed as mean±SD (standard deviation) whereas nominal variables which include: sex, sites, clinical presentation, grade, LN and stage were expressed as number and percentage. Spearman Rank coefficient of correlation (r) was used to find the relation between any two variables. Statistical analysis was done with SPSS (statistical package for social sciences) V20. The level of (≤0.05) was considered significant, while the level of (≤0.001) was considered highly significant for interpretation of P values.

Tumor depth measurement: An ocular micrometer was used to account the distance (to the closer mm) from stratum granulosum to the inmost point of neoplasminfestation, in ulcerated lesions the thickness deliberated from the ground of the ulcer instead of granular cell layer, neglecting any superficial keratin or inflammatory insinuate that may subsist in all cases. For each section, the power field (4X) were used. The patients were distributed into 3 groups as stated by their TD measurement:1: ≤3mm, 2: 4–7 mm, 3: >7 mm. Figure 2.

Results

Clinicopathologic Characteristics: The age ranges from 22 to 82 years (mean ± SD = 55.67±15.45).
Twenty-seven patients (60%) were male, the rest 18 (40%) were female, with male to female ratio was 1.5:1. Primary sites were mainly identified in the tongue (22 cases= 48.89%), followed by the lip (8 cases= 17.78%), buccal mucosa (6 cases=13.33%) and only one case was recorded in the floor of the mouth (1 case= 2.22%). Twenty-four cases (53.33%) presented as mass, the remaining 21 cases (46.67%) were presented as ulcer.

Mean score (range) 1.73±0.70 2.6±0.20
According to Chi-Square test, the IHC expression of VIM announced a respectable positive interconnection with tumor stage ($r=0.238$, $P=0.024$), TD ($r=0.137$, $P=0.045$), and LN metastasis ($r=0.554$, $P=0.039$). Whereas, MMP-9 revealed meaningful positive relation with both TD ($r=0.013$, $P=0.015$) and LN metastasis ($r=0.421$, $P=0.034$). Moreover, there was a respectable positive linkage between VIM and MMP-9 ($r=0.666$, $P=0.034$). Table: 4.

**Discussion**

The present study showed significant positive correlation between IHC expression of both VIM and MMP-9 and the following: depth of point of tumor front, involvement of lymph node by malignant cells and stage of disease. These findings disclose the predictive role of both VIM and MMP-9 in determining the prognosis of OSCC.

In this regards a study showed Enhanced expression of VIM in association with a direction across a greater metastatic risk (33% versus 77%) and the author concluded that attain of VIM may be associated with
reinforcement of immigration of tumor cells, resulting in elevated rate of metastasis in head and neck squamous cell carcinoma. In one study, multivariate analysis showed that VIM IHC was independent prognostic factors for OSCC of patients. Vimentin is a primedesignation of EMT, and novelproof has convey it to be an substantialorganizer of cellular motion. There are various proceedings that realize the metastatic cascade, many of which regulates directly or indirectly by VIM: EMT, violation of the basement membrane, separation of cells from the premiermalignant tissue, inroad into another tissue, and promotion at secondary site.

On the other hand, a study showed significant association between IHC manifestation of MMP-9 and involvement of nodes in patients with OSCC, a finding that is similar to the result of the present study. In support of the results, Lotfi et al. found a significant role for MMP-9 in predicting lymph node metastasis in OSCC; however, the marker was measured in serum of patients rather than in tissue. Furthermore, in study conducted by lawal et al. found poor prognosis for OSCC in association with high IHC expression of MMP-9.

In cancer, upset in proteolysis leads to tumor cells growth disturbance, tissue rehashing, inflammation, obstruction of tissue, and spreading of malignant cells. The matrix metalloproteinases (MMPs) typify the most eminent family of proteinases connected with tumorigenesis. Modern technological evolution has distinctly developed our perception of MMPs as efficacious of the tumor microenvironment. Moreover, to their function in extracellular matrix turnover and malignant cell peregrination, MMPs coordinate coding passage that orient cell growth, and might act in a nonproteolytic situation. These aspects of MMPStask are redirects our accessintreatment of oral malignancies. Once activated, MMP-9 may initiate a negative feedback hint, for example, by insulting plasminogen and thus intervention with plasminogen transformation to active plasin. This knotted organization of MMP-9 efficiency is requisite, given that unharnpered proteinase efficacymitted from inflammatory cells may cause tissue injury and the pertinacity of the tumor progression in cancer.

Vimentin score was proved to be positively correlated with MMP-9. This is an indication of the combined ability of a malignant cell to express both markers when they undergo down differentiation. These results suggest that Vim and MMP-9 may contribute in epithelial acquires mesenchymal properties and making the cell more powerful in invasion and metastasis. This is in agreement with the findings of Ding et al., and Zhu, 2010 found that Vim and MMP-9 expression showed a positive correlation ($r = 0.789, P<0.01$), and concluded that they can be used as a reference indicator of early diagnosis and prognosis.

In conclusion, the higher IHC expression of VIM and MMP-9 in OSCC are run in parallel with upmost proportion of lymph node metastasis, deeper tissue invasion and hence with worse prognosis.

Abstract

Background and Objective: This study was conducted to measure the difference between Chrome Cobalt telescopic crowns and Poly ether ether ketone (PEEK) telescopic crowns retaining implant retained partial overdenture.

Materials and Method: This is a comparitive study that included fourteen lower kennedy class I partially edendulous patients. All patients received posterior implant in the second molar area in each side. The patients were divided into 2 groups, the first group received chrome cobalt telescopic crown and the second group received poly ether ketone telescopic crowns over the implants. Partial overdenture was constructed for all the patients in the two groups. Patients were followed up clinically to measure crestal bone height changes using cone beam ct, implant stability test using osstell and periodontal pocket depths.

Results: Both groups showed increase in implant stability, periodontal pocket depths and decrease in crestal bone height,however the difference between the two groups were non-significant except in the periodontal pocket depth, the chrome cobalt group showed increased pocket depths than the PEEK group.

Conclusions: From the results of this study the following conclusions could be obtained. There was almost no difference in crestal bone height resorption between the CrCo and the PEEK telescopic crowns, the difference between implant stability in both groups were non-significant, at the end of the follow up period, the PEEK telescopic crown group showed lesser periodontal pocket depths than the CrCo group which suggests that the PEEK is more biocompatible than the metallic crowns.

Keywords: Telescopic, crown materials, partial overdenture.

Introduction

Posterior free end saddle edentulous patients are the most prevalent among the population. The absence of posterior abutments may affect the support, retention and stability of the prosthesis. Loss of posterior teeth results in loss of neuromuscular stability of the mandible and loss of vertical dimension of occlusion.¹,²

The great difference in the resiliency between the soft tissues and the teeth will have a damaging effect on the remaining abutment teeth with unfavorable movements with subsequent patient dissatisfaction.³,⁴

The rehabilitation of partially edentulous patients with missing mandibular premolars and molars with implant supported overdentures showed successful results.⁵

Implant supported telescopic prosthesis is a reliable method of treatment of atrophied arches that ensures better masticatory function, esthetics, oral hygiene.⁶

The placement of implants in partially edentulous patients to retain tooth-implant telescopic prosthesis proved to be a successful line of treatment.⁷
Metal-free restorations are becoming increasingly important in dentistry due to the increased aesthetic demands of the patient and possible material incompatibility.\[8\]

In dentistry, Peek can be utilized in the construction of CAD/CAM removable and fixed prosthesis.\[9,15\] PEEK can be used as fixed crowns to create a more wettable surface and to facilitate its bonding with hydrophobic resin composites. Many studies suggested the use of PEEK with more advantageous than alloy and ceramic restorations because of its mechanical properties.\[14,16-19\]

**Materials and Method**

This study included fourteen patients having Kennedy class I in the lower arch with first premolar being the last standing abutment were selected.

Patients were carefully informed about the treatment procedure and agreed to participate in the study. A cone beam computed tomography was taken to evaluate the bone height, width and density in the area of interest.

All the patients received the same kind of implants (Neobiotech IS II Active Fixture, Korea). Two implants were placed in each patient in the posterior mandible area (estimate in the lower 7 region). Flap was raised and implants were placed using free hand technique. Fig. (1). After placement of implants, they were covered by the cover screw and the flap was sutured.

After four months, all the implants were exposed, and healing collars were placed for each patient for one week. After one week the healing collars were removed and the abutments were placed in position to start the prosthetic phase.

Patients were divided randomly into two equal groups. The first group received partial overdenture covering chrome cobalt telescopic crowns and the second group one received partial overdenture covering polyetherether ketone telescopic crowns.

Primary impressions were taken to prepare for a special tray. Then secondary impressions were taken for the fabrication of the telescopic crowns. Telescopic crowns were fabricated and cemented over the implant abutments. Fig. (2)

Custom made perforated acrylic resin tray was constructed and preliminary surveying of the lower study cast was carried out. Inside the patient’s mouth, mesial occlusal rest seat and distal guiding plane were prepared on the first premolar bilaterally. Final impression was taken and poured into improved dental stone to obtain master cast. Secondary surveying was done for master casts before duplication. The partial denture framework was casted in cobalt-chromium alloy. Metal framework try in was done to ensure proper seating of the partial denture. Bite registration were done.

Waxed partial dentures were then tried inside patient’s mouth and processed using heat cured acrylic resin (Acrostone Dental Factory, Cairo, Egypt), finished and polished. Fig. (3)
Clinical follow up: CPCT was used to detect changes in crestal bone height at denture insertion. On each follow up visit, mesial and distal crestal bone levels were calculated from the reconstructed corrected sagittal views. Similarly, buccal and lingual bone levels were calculated by using cross-sectional views. Average readings of the four sides at each interval were calculated and tabulated for statistical analysis. Implant stability was measured using resonance frequency analysis (Ostell® Integration Diagnostics AB, Gothenburg, Sweden). A periodontal pocket depth was measured using graduated periodontal probe.

Results

A. Crestal Bone Height: At overdenture insertion, the mean crestal bone height was significantly higher in PEEK group than in CrCo group (P=0.000). After 6 months, PEEK group yielded significantly higher mean values than CrCo group (P=0.003). At 12 months, the crestal bone height was also significantly higher in PEEK group than CrCo group (P=0.018).

Discussion

In this study fourteen partially edentulous patients were selected with mandibular kennedy class I with the first premolar as the last standing abutment.

Two stage surgical protocol was followed to identify the effect of early loading on implants. Prospective clinical studies showed that two-stage system was preferred because it showed higher bone contact percentage than one-stage system.\[20]\]

Telescopic crowns were used in this study as they are characterized by lesser number of implants, comparatively higher retention and flexible prosthetic design.\[21-24]\]

Two types of telescopic crowns were fabricated over the implants, chrome cobalt and PEEK to increase the retention of the prosthesis. Implant supported telescopic partial overdenture was chosen as a treatment option as it is a reliable method of treatment of atrophied arches.\[6]\]

Cone beam computed tomography (CBCT) was used effectively to detect bone height.\[25]\]

Resonance Frequency Analysis (RFA) technique using Ostell was used for measuring dental implant stability.\[26]\] Pocket depth was measured to assess the condition of the implants.\[27]\]

All the implants investigated during the follow-up period showed satisfactory results within the parameters studied. By the end of follow up period, there was significant decrease in the bone height in the two groups with the decrease in chrome cobalt telescopic crown group was 1mm while in the PEEK telescopic crown group was 1.1 mm. This amount of reduction was within the acceptable range of implant success and it agrees with the findings of Merheb J. et al.\[28,29]\]
There was a significant difference between the chrome cobalt telescopic crowns and the PEEK telescopic crowns with the PEEK telescopic crowns showed higher bone levels at the three follow up periods. This is usually due to the bone reaction of some patients in the chrome cobalt telescopic crowns group.

Concerning the implant stability, within the two groups, the Osstell readings were significantly lowest at overdenture insertion. The great changes in implant stability followed by the slow change are due to the formation of woven bone and the deposition of lamellar bone between zero and 4.5 months. [30]

At each follow-up period, there were no statistically significant differences in Osstell readings between CrCo and PEEK groups; this suggests that the two types of telescopic crowns had the same effect on the stability of dental implants.

The periodontal pocket depths within CrCo group was significantly highest after 12 months, followed by that measured at 6 months. Within PEEK group, the mean pocket depth after 12 months was significantly higher than at overdenture insertion. While the mean value recorded after 6 months had no significant difference with those measured at insertion and 12 months. This increase is attributed to the gingival inflammation caused by overdenture therapy and the decrease in crestal bone height. These findings agree with Renner et al, Toolson et al and Telleman et al.[31-34]

There were no statistically significant differences between pocket depth mean values between CrCo and PEEK groups at overdenture insertion and 6 months but after 12 months CrCo group displayed significantly higher mean pocket depth than PEEK group.

This could be explained by that the PEEK has better biocompatible nature, less plaque accumulation and almost no gingival inflammation around the implants. [35,36]

Conclusions

From the results of this study it can be concluded that:

1. There were no difference in crestal bone height resorption between the CrCo and the PEEK telescopic crowns.
2. The difference between implant stability in both groups were non-significant

At the end of the follow up period, the PEEK telescopic crown group showed lesser periodontal pocket depths than the CrCo group which suggests that the PEEK is more biocompatible than the metallic crowns.

Renal Protective Effect of Quercetin on Cisplatin-Induced on Some Blood Parameters and Nephrotoxicity in Male Rats

Baida R. Ali

Department of Pathological Analysis, College of Sciences, University of Thi-Qar, Iraq

Abstract

This work was carried out to investigate the possible protective effect of quercetin some blood parameters and nephrotoxicity in male rats treated with cisplatin. Cisplatin is an important chemotherapeutic agent useful in the treatment of several cancers such as tumors of the testis (including extragonadal germ cell tumors), ovarian cancer, small cell and non-small cell lung cancer, squamous cell carcinomas of the head and neck, and despite the availability of some newer and less toxic quercetin drugs. Eighteen blood samples were obtained from male rats which divided into three groups for each group (n = 6), the first group (control), the second group (Cisplatin) and third group (Cisplatin + Quercetin). There is a significant decrease (P <0.05) in Creatinine, urea and TNF-α concentrations in second group compared with the control and third groups. Also, the result showed a significant increase Creatinine, urea and TNF-α concentrations in second group compared with the control group. The results showed a significant increase (P≤0.05) in red blood cell count(RBC), packed cell volume (HCT), hemoglobin (Hb) and Platelet in second groups compared with the control and third groups, also it showed a significant decrease in third group compared with control group. Therefore, the present study is undertaken to investigate the possible some blood parameter and renal protective effect of quercetin in rats treated with cisplatin.

Keywords: Cisplatin, Quercetin, acute kidney injury, blood parameters and nephrotoxicity.

Introduction

The human kidneys together account for less than 1% of body weight, yet receive about 25% of the cardiac output. Acute kidney injury (AKI) is defined as a clinical syndrome characterized by a rapid decrease in renal function together with the accumulation of waste products such as urea. Cisplatin (cis-diammine dichloro platinum, CDDP) is an alkylating inorganic compound that is widely used as a potent anticancer agent against variety of tumors including testes, ovaries, breasts, lung, and bladder cancer. Cisplatin and other platinum derivatives are the most widely used chemotherapeutic agents to treat tumors including ovarian, head, neck and testicular germ cell tumors. A known complication of cisplatin administration is acute kidney injury (AKI). The mechanism for this renal cell injury has been the focus of intense investigation for many years, and recent studies suggest that inflammation, oxidative stress injury, and apoptosis probably explain part of this injury. However, a large fraction of human malignancies rapidly become insensitive to the cytotoxic effects of cisplatin. Therefore, it is important to improve the sensitivity of chemotherapeutic agents in order to reduce drug dosage and improve the efficacy of treatment. Combination medication was recommended to improve the effectiveness of cancer therapy and reduce the side effect of cisplatin. Quercetin is a type of flavonoid antioxidant that’s found in plant foods. Quercetin has been reported to exert numerous pharmacological activities such as free radical scavenging, TNF-alpha inhibition and anticarcinogenic effects. Nephrotoxicity can be defined as renal disease or dysfunction that arises as a direct or indirect result of exposure to medicines and industrial or environmental chemicals. It is a serious condition that often requires intensive care. After appropriate diagnosis and treatment, the kidneys can restore function such that acute kidney injury can be reversed. The exact mechanisms of nephrotoxicity induced by cisplatin are still not fully elucidated. A variety of cell types have suggested that cancer chemotherapy drugs induce cell apoptosis by induction of formation of reactive oxygen species (ROS) and that the generation of ROS and lipid peroxidation is responsible for the cisplatin induced renal tubular injury. Studies in rats and mice indicate that cisplatin undergoes metabolic activation in the kidney.
to more potent toxins. This process begins with the formation of glutathione conjugates in the circulation, perhaps mediated by glutathione-S-transferase. As the glutathione conjugates pass through the kidney, several apoptotic pathways have been implicated in cisplatin-induced renal epithelial cell death, including the extrinsic pathway activated through death receptors such as Tumor necrosis factor (TNF) receptors, the intrinsic mitochondrial pathway and the endoplasmic reticulum stress pathway. Dosage of cisplatin depends on the clinical condition, renal response, hematological and otic response of the patient, also the carcinoma being treated and the combination with other cancer chemotherapy agents. Erythropoietin (EPO) has recently been shown to exert important cytoprotective and antiapoptotic effects in experimental cisplatin-induced nephrotoxicity and ischaemic acute renal injury. The results suggest that, in addition to its well-known erythropoietic effects, EPO inhibits apoptotic cell death, enhances tubular epithelial regeneration and promotes renal functional recovery in hypoxic or ischaemic acute renal injury. The aim of the study is to determine the toxicity of cisplatin on blood parameters and its effect on kidney function, also, effect quercetin on cisplatin induced on some blood parameters and nephrotoxicity.

Materials and Method

Eighteen male rats aged 20 - 25 weeks with a weight of (250 to 300 g), were obtained from the animal house Biology Department, Science College, Thi-Qar University, Iraq. They are housed in a room at constant temperature of (20-22˚C) with 12 h light/dark cycles and fed a standard laboratory rat diet and water ad libitum. The male rats divided into three groups each consisting of 6 animals (n = 6) and were as follows:

1. **The first group (control)**, treated I.P. with a signal dose of (5 ml/animal /day) of normal saline (0.9% NaCl).

2. **The second group**, treated I.P. with a signal dose (10 mg/kg) of Cisplatin.

3. **The third group**, treated I.P. with a signal dose of (100 mg/kg) Quercetin orally by gastric savage 10 hr before and 24 hr. after cisplatin injection of Creatinine, urea and TNF-α determination.

At the end of the experiment period 30 day the animals were killed. The blood and biochemical parameters were measured in the laboratory of Hussain Hospital in Thi-Qar, Iraq. 4 ml of blood samples were collected and divided in to two parts the first part was 2 ml by EDTA tubes, and analyzed to determine of hematological parameters such as a red blood cell count (RBC), the packed cell volume (PCV), hemoglobin (Hb) and platelets (PLT) by using an automatic hematological assay analyzer and the second part was 2ml blood was collected from each animal into plain centrifuge tubes, at room temperature for clotting. Serum was separated by centrifugation at 3000g for 30 min and analyzed, for the concentration

**Statistical Analysis:** All data were expressed as mean ± SD, then subjected to statistical analysis using SPSS software version (16), to know the Least significant differences (L.S.D). P-value < 0.05 was considered to be statistically significant.

**Results**

The effect of quercetin on renal injury markers in cisplatin-induced nephrotoxicity of male rats in table 1, the results showed a significant increase (P≤0.05) in Creatinine, urea and TNF-α concentrations in second group compared with the control and third groups. Also, the result showed a significant increase Creatinine, urea and TNF-α concentrations in second group compared with the control groups.

Discussion

Anemia in cancer patients is multifactorial, resulting from nutritional deficiencies, decreased production of red blood cells, and/or increased loss/destruction of blood and may occur as a either a direct effect of the cancer or due to chemical factors produced by the cancer. In our study we observed a significant fall in total red blood cell count, packed cell volume and hematocrit in all the cancer patients in comparison to base line (before starting the chemotherapy). In the same study it was tumor cells that were attributed to the development of anemia. Cisplatin is known to cause anemia by interfering in the iron metabolism. Cisplatin is a very effective chemotherapeutic agent, used in the treatment of a wide range of malignant diseases. Cis administration might cause many unwelcome adverse effects, such as genotoxicity, nephrotoxicity and hepatotoxicity that any of them may limit its clinical use15. The anticancer drug cisplatin is a very effective compound in the treatment of several cancers. Its clinical use, however, is associated with severe side effects. Main side effect which limits its use in treatment of cancers is nephrotoxicity16,17. Cisplatin in the kidneys penetrates the tubular cells and reaches high concentration in the proximal tubules. Glomerular injury is less frequent. Tubular damage manifests through impaired reabsorption which is characterized by reduced glomerular filtration rate, increased serum Creatinine and blood urea concentrations18. The cisplatin-induced tubular damage is complex and involves a number of interconnected factors such as accumulation of cisplatin mediated by membrane transportation, conversion into nephrotoxins, mitochondrial dysfunction oxidative stress, inflammatory response19. The administration of quercetin resulted in significantly lower serum Creatinine and urea concentration that may be attributed to the action of flavonoid in the prevention of renal toxicity that the antioxidant properties of quercetin is likely to be shared by other flavonoids20. The present results suggest that quercetin is a potentially effective chemoprotective agent by acting in the kidneys as a potent scavenger of free radicals. We studied the effect of quercetin on several mediators and players of the renal inflammation and leucocyte infiltration observed after treatment with cisplatin. Particularly, we measured the renal levels of the TNF-α. Therefore, our study was designed to deeply examine the protective effect of quercetin on the underlying mechanisms of cisplatin induced nephrotoxicity and, the effect on the anti-tumour activity in tumour-bearing rats. Quercetin has been reported as a renoprotective agent in cisplatin-induced nephrotoxicity21. Oxidative stress is also involved in the inflammatory response, ROS can induce inflammatory processes via activation of transcription factors such as NF-jB, which in turn induce the production of pro-inflammatory cytokines, such as TNF-α. As such, the beneficial effect of quercetin might also be related to amelioration of inflammation22. The present study showed that quercetin significantly decreased plasma TNF-α in quercetin protection group. This study showed the protective effects of quercetin on cisplatin induced nephrotoxicity by inhibiting pro-inflammatory cytokines production as TNF-α. Quercetin has protective effects on acute kidney injury who indicated that, in rat, acted via inhibition of TNF-α (an important cytokine involved in systemic inflammation and the acute phase response), and that this inhibition may act to stabilize a cell survival factor. Besides tubular protection, direct haemodynamic effects may also be invoked to explain the effect of quercetin in the maintenance of GFR through the preservation of blood supply to the kidney. Quercetin administered in daily oral doses before and after cisplatin treatment either prevented or significantly reduced the development of cisplatin-induced acute renal failure as evidenced by functional findings23. showed that Cis causes significant effects on hematological parameters only during chronic treatment in humans and rats. Showed fall in hemoglobin level. Our previous results showed that high, acute doses of Cis did not affect the RBC maturation in rats24. The results of our study are
in accordance with literature data and show that chronic application of Cis induced depletion in RBC number and maturation.\textsuperscript{25} showed that incubation of human venous blood in the presence of Se is followed by hemolysis. This could explain the occurrence of reticulocytosis, an indicator of stimulated erythropoiesis. was reported that cisplatin treatment causes anemia as a result of fall in the levels of Hb, PCV and TRBC. In the same study it was reported that the reduction of glutathione level in the blood and tumor cells was attributed to the development of anemia. In other studies, on mice it was found that cisplatin was more toxic to earlier haemopoietic progenitor cells then the mature ones\textsuperscript{26}.

\textsuperscript{22}have shown that cis causes oxidative stress in human platelets and lymphocytes, which might reflect on their life expectancy, the induction of apoptosis, and thereby ultimately reduce the number of these cells in the blood. The nephrotoxic effects of Cis\textsuperscript{23} could be related to renal failure, leading to the loss of body fluids and hemoconcentration and therefore an increased hematocrit in cis treated animals Se in the co-treatment with Cis recovered the number of these blood cells to the control level, indicating that it has preventive and protective effects. Indeed, co-administration of quercetin clearly improves the pharmacotoxicological profile of this family of drugs by reducing their most important side effect.

**Conclusion**

It can be concluded that quercetin is a promising compound for reducing the risk of cisplatin induced nephrotoxicity. So, supplementation with this dietary antioxidant could maintain the integrity of lipid in kidney and blood parameters under oxidative stress during chemotherapy.

Factors Influencing Professionalism of Nurses in Community Based Non-life Insurance Company in South Korea

En-Ju Song1, Bo Young Kim2

1Nurse Counselor, Gwangju OK Hospital, Pung-yeonglo 214, Gwangsan-gu, 62225, Gwangju, Korea, 2Assistant Professor, College of Nursing, Institute of Health Sciences, Gyeongsang National University, 816-15 Jinju-daero, Jinju 52727, Gyeongnam, Korea

Abstract

The purpose of this study was attempted to increase the nursing professionalism of nurse in community based non-life insurance companies (CBNLIC) by understanding effects of Ethical dilemmas and decision-making type on their professionalism. This study utilized a structured questionnaire survey of nurses in CBNLIC (103 nurses) in the whole country. Data were collected from 1 August to 31 August, 2015. Data were analyzed with descriptive statistics, t-test, one way ANOVA, and multiple regressions using the SPSS 20.0 program. This study showed that major variables which had statistically meaningful differences on nursing professionalism were job satisfaction (β=.364, p<.001), reasonable decision-making type (β=.258, p=.003), and dependent decision-making type (β=-.289, p=.002). And those variables explained 38.2% of nursing professionalism (F=11.501, p<.001). Developing a program which can improve quality of nurse in non-life insurance company, is required to enhance their performance.

Keywords: Insurance, nurses, professionalism, ethics, decision-making.

Introduction

The ‘best economic system’ created by mankind is the insurance against the risks that may arise at anytime, anywhere in the uncertain future1. Insurance contracts involve risks such as illegal, gambling, and unfair conduct, and the risk of insurance fraud or insurance crime is relatively high2. According to the statistics of the Financial Supervisory Service in Korea in 2016, the number of auto insurance fraud detectors in 2016 was 83,012, amounting to 7,185 billion won, and this number is increasing every year and insurance fraud is becoming a social problem3.

The Korean government opened the ‘Insurance Fraud Prevention Center’ to investigate and analyze information on suspicion of insurance fraud obtained from the general public, and to investigate cases in which fraud is suspected4. Several non-life insurers in Korea are also working to prevent insurance fraud by operating a special investigation unit that specializes in insurance fraud. In particular, the role of nurses who have been employed for the purpose of medical examination and the efficiency of compensation work has been expanded. On the other hand, in the United States and the United Kingdom, independent adjusters or loss adjusters carry out work commissioned by community based insurance companies1-2. In addition to investigation, confirmation, and evaluation, consultation and adjustment are also carried out between the insurance company and the insured1-2,4.

These roles are performed by nurses who are examiners of community based non-life insurance companies (CBNLIC), and their role is to serve as a judge, manager, coordinator, educator, and researcher in conducting medical education for compensating staff5. This role places high importance on professionalism. In addition, the nurse face the ethical dilemma of managing and counseling the victims and assessing the appropriateness of the medical expenses, while at the same time performing financial evaluation and

Tel.:+82-55-772-8248
management tasks related to compensation in the conventional medical services.

Non-life insurance nurses experience negative feelings of frustration, anger, helplessness, exhaustion, and experience leads to a decrease in job satisfaction. The lowered job satisfaction detrimentally affects work performance and efficiency, and this hinders the development of nurses and the nursing profession. In addition, when a nurse is in an ethical dilemma, proper decision-making ability is required. In decision-making individuals perceive and respond to decision-making tasks. In particular, nurses for non-life insurance companies need to make rational decisions to calculate objective and fair damage for victims of traffic accidents. In this light, it is necessary to conduct basic research on nurses self-awareness and ethical attitudes toward nurses expand the scope of nurses activities to various fields including insurance institutions.

Previous studies have shown that the factors affecting professionalism include self-efficacy, job satisfaction, job commitment, and job performance. The role of nurses at non-life insurers is a new area based on medical knowledge and clinical experience. More specifically, nurses are professionals who carry out non-life insurance inspections based on expert knowledge, such as understanding of automobile insurance and the medical insurance system and policy, and compensatory and legal knowledge of car injuries and disabilities. It is important to examine the professionalism and ethical attitude of nurses to expand the scope of their activities to various fields such as non-life insurers. Thus, this study investigates the ethical dilemmas nurses experience in the work of accident insurance review and how decision-making affects their professional work.

Method

Sample and Data Collection: This study utilized a cross-sectional research design that investigated the linking nurse who belongs to the Korean CBNLIC. The CBNLICs located in Seoul, Gangnam, Kyongwon, Chungcheong, Honam, and Daegu Compensation Center in South Korea. The study period ranged from August 1, 2015 to August 31, 2015. A total of 129 questionnaires were distributed to all of the respondents, and 103 (79.8%) were collected. 26 expressed their lack of interest in the study as a reason for refusal.

Measurements: The ethical dilemma was modified and supplemented to measure the ethical dilemma experienced by Park nurses during the course of their work, and the total score was 13 points. This tool consists of examination of medical expenses, injury and disability management, victim management, statistics, and others. The possible score range is from 13 to 65, and the higher the score is, the greater the ethical dilemma is. In Park, Cronbach’s α was .75 and similarly in the current study our Cronbach’s α was 0.94. The type of decision making is based on Harring’s Assessment of Career Decision Making (ACDM), which was modified and supplemented by Koh. The tool consists of a rational decision type, an intuitive decision type, and a dependent decision type. The score range for each type is 10-50 points. In Koh, Cronbach’s α was 0.84 and in this study it was 0.77. Professionalism used a tool that standardized Hall’s Professional Inventory in Korean by Baek, Kim and Soo. This tool is composed of professional organization, the belief in public service, autonomy, belief in self-regulation, and a sense of calling for work. The possible score range is 25 ~ 125 points. Previous studies have indicated reliability with Cronbach’s α 0.82, in the current study had a reliability of 0.75.

Data Analyses: Statistical analysis was performed using SPSS / win 20.0. The general characteristics of the subjects, the ethical dilemmas associated with variables were calculated with real numbers, percentages, means, and standard deviations. The differences in the professionalism according to the general characteristics of the subjects were analyzed using a t-test and ANOVA. The factors affecting the professionalism of the subjects were analyzed by multiple-regression.

Results

Differences in Professionalism of Participants according to General Characteristics: As seen in Table 1, the participants’ mean age 41.6 year. There was a statistically significant difference according to general characteristics according to job satisfaction (F = 13.24, p<.001). Table 1 showed that there was no significant difference in the professionalism according to education level, NIS experience, current position, and job stress.

Descriptive Statistics: Table 2 shows degrees of ethical dilemma, decision making type, and professionalism. Ethical dilemma was scored as 2.47±.70. The nurses of non-life insurers showed the highest ethical dilemma among victim management. This is because most auto-insured patients are patients with minor injuries, but unnecessary hospitalization and long term treatment increased the demand for the victim. In principle, this appears to be due to the work of managing and adjusting the conflicts arising from management of an appropriate loss ratio by applying the insurance premium calculation standard. On the other hand, there was a low level of counseling and medical knowledge provision on statistics and health problems of medical expenses and disability related items. Decision making type was scored as 2.92±.26. The nurses consider the patient’s health and interests to be the top priority because it is an important issue or difficulty about the ethical dilemma. Therefore, it is necessary to discuss the dilemma experienced in the field in order to facilitate logical and systematic decision-making and to develop the ability to make decisions through continuing nursing ethics and value education. The degree of professionalism was scored as 3.29±.30. As a result, the establishment of professionalism of nurses improved the performance of non-life insurer nurses, control turnover, and promote quality insurance.

The Influencing Factors on Professionalism: Table 3 shows the correlations of professionalism with ethical dilemma and decision making type. In order to identify factors affecting the professionalism of the subjects, the departments that showed a significant relationship in general characteristics of the subjects, job satisfaction and ethical dilemma, rational decision type, and intuitive decision type were measured correlations and then subjected to a multiple regression analysis. The main factors affecting the professionalism of the
subjects are the departments (β = .290, \( p = .001 \)), job satisfaction (β = .364, \( p < .001 \)), rational decision type (β = .258, \( p = .003 \)), and dependent decision type (β = -.289, \( p = .002 \)) were statistically significant, and they had an F score of 11.501 (\( p < .001 \)) and an explanatory power of 38.2% (Table 4).

**Discussion & Conclusion**

This study was conducted to determine the degree of professionalism of CBNLIC in South Korea and discuss the effects of ethical dilemmas and decision-making styles on professionalism.

First, the degree of professionalism of the subjects was 3.29 points, similar to the value (3.33) of Han, Sohn, Park, and Kang\(^\text{12}\), who did not use the same tools but studied hospital nurses. In addition, in the results of Lee and Kim\(^\text{18}\), who studied nurses according to the size of the hospital, the occupational specialty score was 3.30, similar to the results of this study. However, in Kim and Park\(^\text{9}\), the score was lower than 4.05. The results of this study were similar to those of previous studies on general nurses, but they were lower than those of professional nurses because of the specialization of medical services and the increasing role of nurses and the increasing specialization of nursing staff. It appears that nurses did not positively perceive their professionalism and identity. Also, in this study, we used a tool to measure the professionalism of nurses.

Second, the factors influencing the participants’ professionalism were the statistically significant effects of job satisfaction, rational decision types, and dependent decision types, with explanatory power of 38.2%. The nurse requires a high level of professional competence to calculate damage compensation for persons injured in an auto accident. In addition, some value problems need to be judged by nurses of CBNLIC, and hence it is necessary to collect enough information and make realistic, careful, and logical decisions. Therefore, it is thought that the decision-making affects the professionalism, consistent with the result of this study.

In the study, the ethical dilemma experienced during job performance was not a significant variable to explain job professionalism. This can be attributed to the fact that the ethical perspective, which is the criterion for the ethical dilemma that arises while performing nursing
work, is not clearly established. Therefore, it is necessary to discuss the dilemma experienced in the field in order to facilitate logical and systematic decision-making and to develop the ability to make decisions through continuing nursing ethics and value education.

Although there is no comparative study because there is no precedent study in which the same concept is researched, the nurses experience diverse situations in the field due to system of non-life insurers, and when making decisions about attitudes and behaviors in the field, it is important to choose types of decisions making. In the case of non-life insurers, the nurse should collect the opinions of experts and various alternatives for problem solving, and then choose the most reasonable method and perceive the responsibility for the choice as important. Therefore, it is important that the social status within the insurance review agency and the scope of the role of the nurse in the decision-making process be clearly identified and the position as a decision maker recognized. In order to ensure that insurance nursing practitioners do not have a conflict of values in problem situations and make reasonable decisions, it is necessary to prepare a strategy to strengthen intensive care education through the CBNLIC association or the compensation medical association.

Job satisfaction has the greatest effect on the participants’ professionalism. The results of this study are similar to those of Lee and Kim, who studied the effects of job satisfaction on professionalism in dental hygienists. The results of this study are similar to those of Cho and Han, in which job satisfaction was found to be an influential variable for home nurses. Satisfaction with occupation is important in achieving more qualitative and efficient work and self-realization by maximizing the ability in performing tasks. This support can improve statusof non-life insurers’ nurses, which would lead to an increase in job satisfaction, which is a positive factor for the management of the company.

There are limitations in this study. First, given the nature of cross-sectional data, causality cannot be inferred. Second, the two instruments measuring ethical dilemma and decision-making have not been validated with non-life insurers’ nurses; however, both measures were validated among medical insurance review nurses in Korea with good internal consistency reliability. Finally, our data focused on Korean nurse population, and thus nurse population in the world was not included in our data. Future studies are necessary that use larger samples, including a multitude of different specialty areas nurse.

Studying TMJ Changes After Using Twin Block Appliance for the Treatment of Class II Cases

Ahmed Abdel Monem Abdel Emam¹, Wael Mohamed Mubarak Refai²

¹Assistant Lecturer of Orthodontics, Faculty of Dentistry, Assuit University, Egypt, ²Professor and Head of Orthodontic Department, Faculty of Dentistry, Minia University, Egypt

Abstract

Twin block appliance was selected for treating 10 children displaying skeletal class II malocclusion, mandibular deficiency. MRI was then used to study the changes that occurs in the TMJ in response to the treatment. All included subjects were free of any TMJ problems. MRI was performed before starting treatment and after 8 months of using twin block appliance, for each patient. Sagittal concentricity, sagittal disc position and eminence angle were calculated for each patient from the MRIs. Insignificant differences were found for the sagittal concentricity, sagittal disc position and the eminence angle before and after treatment. When comparing sagittal concentricity, sagittal disc position and eminence angle for the right and left TMJs of each patient, significant difference was recorded either before or after treatment for the disc position while the results were insignificant for the rest.

Keywords: Twin block, TMJ, MRI.

Introduction

One of the most common malocclusions in children is skeletal class II cases mandibular retrusion. Many appliances can be used for such cases as Activator, Frankel, Twin block or Herbst appliance.

One of the most popularly used functional appliances for treating skeletal class II cases, is the twin block appliance originally developed by William J Clark [1].

Functional appliances work by moving the mandible into a more forward position thus displacing the condyles in the glenoid fossa and promoting remodeling on the articular surfaces of the TMJ. Chavan SJ., et al 2014[2].

MRI is believed to be radiation free, non-invasive and gives accurate images of soft and bony tissues of the TMJ, so considered to be best choice for imaging temporomandibular disorders. Wadhawan N., et al. 2008 [3].

TMJ adaptation and remodeling in response to using twin block appliances was the concern of many authors and to study the changes between the right and left TMJs before and after treatment Livieratos FA, 1995 [4].

This study aimed to examine the TMJ changes that occur after using twin block appliance in treating skeletal class II cases.

Materials and Method

Ten female patients were selected, all of which were skeletal class II with overjet more than 5 mm. all of them were growing patients in their pre-pubertal growth period with a mean age of 11.5 years.

None of the patients had previous orthopedic, orthodontic or surgical treatment, and all of them had retracted mandible with normal maxillary growth.

One of the main inclusion criteria that none of these patients suffered or had any temporomandibular disorders or problems.

Treatment procedures were explained to each patient and their parents and a written assent was signed by them.

TMJ imaging was conducted using MRI machine of 1.5 tesla with bilateral TMJ coils and both sides were imaged.

Patients were instructed to bite in maximal intercuspation during pre-treatment images, while in post-treatment unstrained retracted mandibular position were used in the images cause of the posterior open bite that develop in patients treated using twin block Chavan SJ.et al 2014 [2].
Condylar position, sagittal disk position and the eminence angle were measured from the recorded MRIs.

**Condylar position:** The sagittal position of the condyle was assessed using the method described by Nezar, et al.[5] by drawing the longitudinal axis of the condyle, it was determined by defining the anterior and posterior poles of the condyle and connecting them with a line. From the middle of this line a perpendicular line was drawn directed cranially passing through the cranial pole of the condyle.

From the middle of the first line, another vertical line was drawn passing through the center of the glenoid fossa (maximum concavity in the fossa).

Condyle was considered in a centric position if both vertical lines overlapped each other, posteriorly positioned if negative angle was formed between the lines and anteriorly positioned if positive value was recorded.

**Sagittal disc position:** Chintakanon., et al.[6] described the method to define the disc position depending on drawing the 12 o’clock line through the center of the condyle and the roof of the fossa. The posterior part of the disc was then measured as an angle to the 12 o’clock position.

The disc can be either anteriorly or posteriorly displaced or normally positioned.

The normal position of the disc lies between 25.7° to -18.7° as given by bySilverstein., et al.[7]

**Eminence angle:** The slope of the eminence was calculated by the angle formed between the tangent to the posterior part of the eminence and the posterior border of the ramus.

**Statistical analysis:** The collected data were analyzed using SPSS software and paired t test was used to describe the difference between the changes of the different variables.

**Results**

The following table shows the comparison of the mean of the right and left TMJ records and their P-value before and after treatment:

| Table (1): comparison of the mean of the right and left TMJ records and their P-value before and after treatment |
|---|---|---|---|---|---|
| Side | Pre | P-Value | Post | P-Value |
| Condylar position | | | | |
| Right | -0.14 | 0.5 | 3.21 | 0.3 |
| Left | -0.98 | 1.3 | | |
| Disc position | | | | |
| Right | 14.1 | 0.01 | 11.2 | 0.03 |
| Left | 12.2 | | 10.4 | |
| Eminence angle | | | | |
| Right | 36.9 | 0.44 | 38.1 | 0.64 |
| Left | 36.2 | | 37.7 | |

The following table shows the comparison of the mean of the right TMJ records and their P-value before and after treatment:

| Table (2): comparison of the mean of the right TMJ records and their P-value before and after treatment |
|---|---|---|
| Side | Pre | P-Value |
| Condylar position | | |
| Right (pre) | -0.14 | 0.3 |
| Right (post) | 3.21 | |
| Disc position | | |
| Right (pre) | 14.1 | 0.37 |
| Right (post) | 12.1 | |
| Eminence angle | | |
| Right (pre) | 36.9 | 0.06 |
| Right (post) | 38.1 | |

The following table shows the comparison of the mean of the left TMJ records and their P-value before and after treatment:

| Table (3): comparison of the mean of the left TMJ records and their P-value before and after treatment |
|---|---|---|
| Side | Pre | P-Value |
| Condylar position | | |
| Left (pre) | -0.98 | 0.44 |
| Left (post) | 1.3 | |
| Disc position | | |
| Left (pre) | 12.2 | 0.39 |
| Left (post) | 10.4 | |
| Eminence angle | | |
| Left (pre) | 36.2 | 0.05 |
| Left (post) | 37.7 | |

**Discussion**

Many authors studied the effect of using twin block appliance in the treatment of skeletal class II mandibular deficiency cases, and some studies used MRI to evaluate the changes that could occur in the TMJ during treatment as Chavan., et al.[4], Ruf and Pancherz[8], Kinzinger., et al.[9], Chintakanon., et al. [6]
According to Foucart et al. [10], and Sanchez et al. [11], bilateral disc displacement in both joints are more common up to 3 times than unilateral disc displacement, so both joints should be studied for TMJ changes after using twin block appliance.

**Condylar position:** It shows the position of the condyle in sagittal direction within the TMJ in relation to the glenoid fossa.

It was evaluated using the method described by Nezar, et al. [5] in which he stated that the condyle is anteriorly positioned when results are positive, posteriorly positioned when negative and concentric when results are zero.

In this study, pre-operative MRIs showed that the condyles were in a non-concentric position that follows the findings of Nezaret al. [5] and Chintakanon Sampson., et al. [6] and when comparing each side of the TMJ separately, pre-operative results were found to be insignificant. These findings come in agreement with Vitral, et al. [12], Rodrigues, et al. [13], Whyte, et al. [14].

The post-operative MRIs showed that the condyle moved to a more anterior position, but when comparing these results of the TMJs either separately or together changes were found to be insignificant.

**Sagittal disc position:** Significant difference was found after 8 months of treatment using the twin block appliance regarding the relation between the pre and post-treatment records of the disc and the condyle in sagittal direction.

Both sides of the disc moved in the same direction and remained within the physiologic range determined by Silverstein, et al, 1994 [7].

**Conclusions**

It could be concluded from these results that condyles moved in an insignificant way to a more anterior position after using twin block appliance, while the disc moved to a more posterior position.

When comparing each side of the TMJ separately, significant difference was recorded concerning the disc position either in the right or the left side.

**Conflict of Interest:** None

Abuse of Appetite Stimulant Medications in AL-Anbar, Iraq

Mohammad Sinjar Farhan
Department of Pharmaceutical Chemistry, College of Pharmacy, University of Anbar, Anbar-Iraq

Abstract

Medication abuse is characterized as utilizing of medications for a non-restorative or non-medicinal reason. In Iraq medicate abuse is a noteworthy issue on the grounds that practically any medication can be effectively acquired from drug stores. Appetite stimulant medications are case of medications that are broadly utilized without a medicine. The examination incorporates 250 persons who utilize these medications in AL-Anbar governorate. A poll incorporate the accompanying inquiries: age, sex, conjugal express, the explanation behind utilize the medication, whether the medication is recommended by doctor or not, sort of medication utilized, the recurrence of day by day portion and finally the degree of reactions of the medications utilized.

Keywords: Abuse of medication, Appetite stimulant, dexamethasone, cyproheptdin.

Introduction

Medication abuse can be essentially characterized as utilizing of medications for a non-helpful or non-therapeutic reason(1). Medication abuse is a term utilized usually for professionally prescribed drugs with clinical viability(2). In Iraq medicate abuse is a broadly spread issue in light of the fact that practically any medication can be effectively gotten from drug stores and medication stores. Appetite stimulant medications are generally utilized without a solution or medicinal supervision to put on body weight and improve viewpoint. Appetite stimulant medication is any medication which builds the craving. A few investigations have demonstrated that there is a solid relationship between self-saw weight status and Weight control conduct (3,4). Incomprehensibly, in many creating networks like Iraq, completion is socially connected with magnificence, success, wellbeing and notoriety, while thinning is seen to be an indication of sick wellbeing or destitution, so using these medications to expand body load so as to improve the state of subject (5-7).

Cyproheptadine hydrochloride in antihistaminic/anticholinergicad Antiserotonergic operator(8). In Iraq cyproheptadine is accessible in two pharmaceutical measurements frames; tablets and syrup and broadly utilized as an Appetite stimulant.

Dexamethasone is a mitigating and immunosuppressant. One of its symptoms is expanded hunger prompting noteworthy weight gain and thusly abused for this reason(9). In Iraq dexamethasone is accessible in various pharmaceutical measurement shapes like tablet, syrup and infusion. Betamethasone is another glucocorticoid steroid with mitigating and immunosuppressive properties (10). In Iraq betamethasone is accessible in various pharmaceutical measurement shapes as tablet and infusion. Tonics incorporate chiefly nutrients and minerals, are accessible in various pharmaceutical measurements shapes like tablet, syrup and injection. This ponder was directed to confirm the abuse of craving stimulant medications by individuals going to private drug stores in AL-Anbar.

Subjects and Strategy: The illustrative cross segment contemplate was directed from January 2018 to May 2019 on a continuous example of 250 subjects, in AL-Anbar, The subjects were gathered from patients going to six private drug stores in various areas to Purchase diverse kinds of Appetite stimulant medications. A poll was developed and incorporated the accompanying inquiries: age, sex, conjugal state, explanation behind utilizing the medication, whether it is recommended by doctor or utilized without medicine, sort of medication utilized, every now and again day by day portion utilized, and degree of symptoms in the subjects of study.
Results and Discussion

Variety of age: The outcomes demonstrated that 18 subjects (7%) utilizing appetite stimulant medications were under 12 years of age, 70 subjects (28%) were between 12-16 years of age, 85 subjects (34%) were between 17-21 years of age, 62 subjects (25%) were between 22-40 years of age and 15 subjects (6%) were over 40 years of age (Figure 1). These numbers showed that appetite stimulant medications are utilized generally by adolescents and youthful grown-ups.

Variety of sex: The outcomes demonstrated that 75 of the subjects (30%) utilized appetite stimulant medications were guys and 175 (70%) were females at a proportion 1:2.3 as females constantly will in general improve their look as finished up from the appropriate responses of members amid talking.

Conjugal state: The investigation uncovered that 156 (62%) of subjects who utilized appetite stimulant medications were single (unmarried), while 94 (38%) of them were hitched. These outcomes demonstrated that the unmarried subjects, maybe the vast majority of them, are attempting to build their body load to improve their shape and to look progressively alluring and solid by other individuals.

The explanation behind utilizing hunger stimulant medications: At the point when the subjects of study were approached about the explanation behind utilizing hunger stimulant medications, 120 (48%) of them credited the reason to low body weight, while 92 subjects (37%) utilized it to improve shape and standpoint, and 38 subjects (15%) said that they utilized it only for general wellbeing (Figure 2). These outcomes showed that the vast majority of the subjects utilizing these medications were either to build body weight or for better outlook. The attractive quality of a specific body estimate aren’t just a self-sufficient, singular decision, yet is intervened by social components. In a few nations there is a craving to get more fit however in different nations there is a longing for completion (11).

Medication recommended by doctor or not: The outcomes demonstrated that just 80 subjects (32%) utilized hunger stimulant medications recommended by doctor or under therapeutic supervision while 170 subjects (68%) utilized these medications without doctor remedy, these outcomes demonstrated that there is an extraordinary abuse of such medications and a large portion of them are utilized without solution or supervision by medicinal specialists.

Sort of appetite stimulant medications utilized: Eighty three of the subjects utilized steroids (33%), while 67 subjects utilized cyproheptadine (27%), 30 of them utilized tonics (vitamins and minerals) (12%), and 50 subjects utilized mixes of these operators (28%) (Figure 3), and these outcomes demonstrated that steroids and cyproheptadine are the most sorts utilized locally in light of the fact that they trust that steroids are the best and quick medications to expand body weight (in view of the network involvement).

Recurrence of day by day portion of craving stimulant medications: One hundred subjects (40%) utilized these medications once every day, 110 subjects (44%) utilized it two times per day, 35 subjects (14%) utilized it three times each day while just 5 subjects (2%) utilized it multiple times each day (Figure 4). These outcomes demonstrated that the majority of subjects like to utilize the medications 1-2 times each day as opposed to a few times each day as it is progressively helpful.

Symptoms: As per our discoveries, just 10% of the subjects utilized general tonics experienced reactions, for the most part gastric issues (like queasiness), half of the subjects utilized cyproheptadine experienced drowsiness and migraine while 80% of subjects who utilized steroids experienced separate symptoms (like edema, skin inflammation, dry layered skin and expanded perspiring) (Figure 5). Cyproheptadine causes sluggishness as is basic with original antihistamines. Sickness and regurgitating are noted ordinarily in individuals with neuromuscular disarranges. Cyproheptadine can likewise cause over-resting (10 hours) in kids and adolescents. (12)
Conclusions

The outcomes acquired from this investigation, demonstrated that there is a misuse of appetite stimulant medications in the subjects took an interest in this examination in AL-Anbar which are not utilized on remedial bases and without doctor supervision. The abuse of appetite stimulant medications is high among youthful age females and utilized by unmarried more than wedded subjects.

The vast majority of the subjects utilized these medications to build body weight and improve outlook (not because of illnesses) and a large portion of them want to take craving stimulant medications two times per day. Dexamethasone was generally utilized appetite stimulant medication and most of subjects utilized steroids had experienced sever side reactions.

\section*{Abstract}

\textbf{Introduction:} Mental and social well-being in adolescents can be improved by organized activities in peer groups. This qualitative study aimed to explore organized activities in peer groups related to mental and social well-being in adolescents.

\textbf{Method:} Five focus groups were carried out with 30 adolescents aged 12–24 in Surabaya, Indonesia. Participants were purposively selected and had all experienced organized activities. A thematic approach was used for analysis and data collection was completed at the point of data saturation.

\textbf{Results:} Four interconnected themes emerged from the data; (a) self-esteem and self-regulation, (b) resilience, hardiness and mental toughness, (c) social adjustment and (d) social support in organized activities. Adolescents who involve in sports, arts, and clubs have high confidence, easiness to control their emotion, stronger in facing various problems. They also felt more adapt, respect, tolerant of others and get social support.

\textbf{Conclusions:} This study demonstrates that organized activities in peer groups improve mental and social well-being. Adolescents can have good self-esteem, self-regulation, resilience, hardiness and mental toughness. Adolescents also can have good social adjustment and social support. One of the efforts to prevent a mental and social problem is early recognition or detection in adolescents.

\textbf{Keywords:} Organized activities, peer groups, mental and social well-being, adolescents, qualitative research, focus groups.

\section*{Introduction}

Mental and social health is one of the health problems in the world, including in Indonesia. One population that has a risk for mental and social health disorders is adolescents. Mental disorders in adolescents include anxiety and depression, while social disorders that occur are social isolation and loneliness.\textsuperscript{1}

Adolescence is a transitional period of development between childhood and adulthood. The development of adolescent social life is characterized by the influence of peers in adolescent life.\textsuperscript{2} Peer groups are a place for adolescents to socialize with peers and they gain social support.\textsuperscript{3,4,5} Activities undertaken by adolescents with peers include activities such as sports, arts and clubs and impact on social and mental well-being.\textsuperscript{6}

World Health Organization states that health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.\textsuperscript{7} Mental health is a state of well-being in which every individual realizes his or her own potential, can work productively and able to make a contribution to the community. A social well-being manifests if one is able to relate to another person or group well.
Criteria of mental well-being as follows mental efficiency, control and integration of motives, control of conflicts and frustrations, positive and healthy feelings and emotions, the tranquility of peace of mind, healthy attitudes, healthy self-concepts, adequate ego identity and adequate relation to reality. Mental well-being enhances our cognitive process, and to deal with simple as well as complex task. It also helps us in developing intrinsic motivation.

Social well-being concerned with social support and interpersonal relationship. Social support was simultaneously related with health and personal control beliefs in relation to well-being. Close support figure can be sufficient to promote well-being. The high social well-being is a positive significance in coping with the stresses of life and developed high productivity to make an effective community. One factor that related to well-being among adolescents was organized activities involvement.

The purpose of this study is to explore organized activities in peer groups related to mental and social well-being in adolescents.

**Materials and Method**

**Study design:** This study used qualitative description as a design and focus group for information gathering to explore organized activities in peer groups related to mental and social well-being in adolescents. This study chose focus groups because this method possible to acquire valuable data. Ethical approval was granted by The Faculty of Public Health Airlangga University Health Research Ethics Committee (No: 69-KEPK).

**Recruitment process:** Participants were male and female students who attend organizations in schools with peer groups. We used a purposive sampling technique, aiming to be inclusive of experiences of boys and girls from diverse backgrounds. Recruitment ended once theoretical saturation was achieved. In total, 30 adolescents ranging in age from 12 and 21 years, 12 participants were girls (40%) and 18 (60%) were boys.

**Conduct of focus groups:** Data collection was carried out by the main researcher from January-December 2017. Focus group were conducted with pupils in same year group to get naturalistic discussions. We designed a questioning route informed by existing mental and social well-being literature and guidance on focus groups. Focus groups lasted 50-60 minutes and were digitally audio recorded. The researcher assistant took field notes including verbal and non-verbal communication. Audio recordings were transcribed verbatim.

**Data analysis:** All data emerging from interviews and field notes helped inform the data-analysis process, were reviewed and coded by the researcher. This study using a thematic analysis approach. Pupils were given the opportunity to feedback on results to encourage participation validation.

**Results**

Five focus groups were conducted in this study with 30 participants. Four interconnected themes emerged from the data; (a) self-esteem and self-regulation, (b) resilience, hardiness and mental toughness, (c) social adjustment and (d) social support in organized activities.

**Self-esteem and self-regulation along join an organized activities:** Participants reported about self-esteem and self-regulation along join an organized activity in peer groups. Self-esteem and self-regulation are part of mental well-being.

Pupil A.2: “I feel more confident after meeting peer groups because they always support positive things I do like sports and arts activities.”

Pupil B.3: “I feel valuable when with them because I am more recognized in the group if I follow the activities of peer groups.”

Pupil C.15: “Before I joined the peer groups, I had difficulty controlling the behavior, but after joining the peer groups, I found it easier to control my behavior for the better.”

Participants felt more confident and valuable after following organized activities in peer groups. They can control behavior after joining organized activities. It can be concluded that adolescents have higher self-esteem and self-regulation than before following peer groups activities.

**Resilience, hardiness and mental toughness in organized activities**

Participants also reported about resilience, hardiness and mental toughness in peer groups activities. Mental well-being in adolescents can be identified by resilience, hardiness, and mental toughness.
Pupil E.19: “I become easier to control feelings of anxiety and stress, after joining the peer groups because we always discuss the problem of group members and find the solution.”

Pupil A.2: “I feel stronger in facing various problems both at school and at home because there is a place to store and solve the problem that is peer groups activities.”

Pupil D.13: “After I attended peer groups activities, I was more able to control my emotions, especially control anger, because my friend reminded me of a patience.”

Participants reported that they felt easier to control their feelings of anxiety and stress than before joining organized activities. They also reported that they felt stronger in facing various problems and easy to control their emotions. It can be concluded that adolescents have better resilience, hardiness, and mental toughness after following peer groups activities.

Social adjustment in organized activities: Interviews related to a social adjustment in peer groups activities, participants reported that they have a good social adjustment along following organized activities in peer groups.

Pupil D.27: “I am more able to adapt and respect others since I join this activity (study club, sports).”

Pupil C.8: “I am more tolerant of my friends in peer groups activity because they come from various backgrounds, such as different in tribe and religion.”

Participants said that they feel more adept, respect and tolerant with others since joining organized activities. This study can be concluded that adolescents have a good social adjustment with the following peer groups activities.

Social support from peers: Participants reported that they get social support from peers along following peer groups activities.

Pupil 3: “My friends give me attention and support if I have a problem, and she/he always help me to solve my problem.”

It can be concluded that adolescents get social support from peers in peer groups activities. This social support important for them to help solve a problem.

Discussion

This qualitative study used focus groups to provide a naturalistic setting in which to explore organized activities in peer groups related to mental and social well-being in adolescents. This study has shown that organized activities (sports, arts, clubs) has consistently been associated with well-being. Mental well-being in the adolescent can be identified by self-esteem and self-regulation. Self-esteem is an individual’s judgment of self-respect. Self-esteem contributes in healthy functioning. There is an association between organized peer groups activities and high self-esteem. High self-esteem has been linked to mental and social health outcomes. Lower externalizing and internalizing problems as well as increased self-regulation, social skills and academic performance. Someone who participated in organized activities demonstrated significantly higher self-regulation. Self-regulation contributes to social and mental well-being. Self-regulation promotes harmonious interactions with others and poor self-regulation can contribute to crime and health risk behavior.

This study has shown that adolescents have a good resilience, hardiness, and mental toughness after following organized activities in peer groups. Resilience is the ability to adapt in life and related to health. School connectedness may provide a role in promoting resilience for mental health for adolescents. Resilience was positively associated with psychological well-being and negatively associated with psychological distress, depression, and anxiety. Hardiness is a personality style characterized by a commitment, control, and perception of problems as a challenge. High hardiness is associated with lower psychological distress, higher quality of life and a high level of mental health. Hardiness is a psychological style associated with resilience, mental and social well-being. Hardiness was negatively correlated with physiological responses of systolic blood pressure, diastolic blood pressure, and respiratory rate. Resilience and hardiness were positively associated with psychological well-being, and negatively associated with psychological distress. Mental toughness was a multi-dimensional construct and positively correlated with mental and social well-being.

This study also has shown that adolescents have a good social adjustment with following organized activities in peer groups. Self-adjustment is the harmony between individuals and the environment in which individuals
can interact, socialize and behave appropriately with the environment. There is a relationship between social adjustment and social well-being. Organized activities have consistently been associated with adjustment and well-being.

This study has shown that adolescents get a social support in peer groups activities. Peer interactions play an important role and related to social support. Organized activities involvement related to social support and adolescent wellbeing.

**Conclusions**

This study has shown that organized activities in peer groups improve mental and social well-being. Adolescents who involve in sports, arts, and clubs have high confidence, easiness to control their emotion, stronger in facing various problems. They also felt more adapt, respect, tolerant of others and get social support. Adolescents can have good self-esteem, self-regulation, resilience, hardness and mental toughness. Adolescents also can have good social adjustment and social support. One of the efforts to prevent a mental and social problem is early recognition or detection in adolescents.

Occupational Asthma Severity among Flour Mill Workers and Adherence to Preventive Guidelines

Shaban M.M.¹, Abdou N.M.², Abdel Rehim A.I.³

¹Doctoral Student, Graduate School, ²Professor at Community Health Nursing Department, ³Assistant Professor at Community Health Nursing Department, Faculty of Nursing, Cairo University, Egypt

Abstract

Aims: To assess the prevalence of occupational asthma among flour mill workers in Giza governorate and adherence to preventive guidelines.

Design: A cross-sectional study

Method: This study was conducted from August 2018 till November 2018 in Egypt. Data were collected through Occupational asthma questionnaire, Spirometry test record, and Workplace observational checklist.

Results: The findings represented that 100% of flour mill workers complained of occupational asthma, 31.1%, and 27.9% of them had moderate and intermittent degree respectively. Concerning occupational asthma symptoms, 68% of flour mill workers complained of persistent cough, 45.9% of them waked up at night due to shortness of breath, and all of them complained of chest wheezing. Moderate and severe airway obstruction represented 18% and 17.2% of them respectively. There were lack of most of preventive measures in the flour mill.

Keywords: Occupational asthma, Flour Mill Workers, and Preventive Guidelines.

Introduction

The flour dust is one of the most common hazards in the flour mills. It is the finely ground particles of cereal or pulses (including contaminants) which result from any grinding process and from any subsequent handling and use of that flour. Flour dust is a hazardous substance; it is a respiratory sensitizer and the cause of allergic rhinitis. It is also an irritant and may give rise to short term respiratory, nasal and eye symptoms. It may provoke an asthmatic attack in flour mill workers with or without pre-existing disease, lead to chronic bronchitis and is known to cause occupational asthma.¹

Occupational asthma is an international problem affecting large number of workers. Few studies were done on occupational asthma in Egypt focusing mainly on asthma symptoms. A study done to investigate the presence of occupational asthma among workers at flour mills of south Cairo which indicated that 25% of mills workers had asthma related to work, the asthma symptoms appeared during work and improved after leaving workplace. Also, the asthmatic workers had lower level of spirometric parameters in relation to non-asthmatic.²

Therefore, the aim of this study was to assess the prevalence of occupational asthma among flour mill workers in Giza governorate and adherence to preventive guidelines.

Research Questions: To achieve the aim of the study the following research questions were formulated:

1. What is the prevalence of occupational asthma among flour mill workers?
2. What are the occupational asthma degrees and symptoms prevailing among flour mill workers?

3. What is the impact of occupational asthma on lung function of flour mill workers?

4. What are the preventive measures applied in the flour mill?

**Materials and Method**

**Research Design:** A cross-sectional design will be utilized to fulfill the aim of the study.

**Subjects:** A convenient sample of 122 flour mill workers from El-Haram flour mill constituted the subjects of the study. The sample size was calculated based on a G-power version 3.1.1 for power analysis. A Power of .95 ($\beta = 1-.95 = .05$) at alpha $.05$ (one-sided) was used as the significance level, and effect size $= 0.3$ was utilized. The inclusion criteria were working at least one year in the flour mill, full-time (8 hours a day for 6 days per week). The exclusion criteria were having a history of bronchial asthma before joining the work or family history and having present or past history of severe respiratory infections as extensive pulmonary tuberculosis. These criteria were according to British Occupational Health Research Foundation [BOHRF].

**Setting:** This study was conducted at South Cairo & Giza Mills & Bakeries Company. It is the largest company in Egypt for the manufacture of flour and has the largest number of workers. It includes 950 workers. El-Haram Mill Branch was selected to implement the study because it includes the largest number of workers. It includes 300 workers out of 950 workers in all mills of the company. In addition, El-Haram mill is the main branch of the company.

**Tools of data collection:** Data were collected using two tools: I: Occupational Asthma Questionnaire: It structured by the researcher based on extensive literature reviews. It included three parts: (a) Workers’ personal characteristics which was consisted of 9 questions (b) Occupational asthma symptoms: It included 22 questions related to reported asthma symptoms as wheezing and tightness in the chest, cough and whether these symptoms improved when the worker was away from work.......etc. (c) occupational asthma flare-ups symptoms: It consisted of 3 questions related to reported sudden symptoms as coughing, shortness of breath, and wheezing.

II: Spirometry Test Record: Spirometry is a standard test used to measure how well patient lungs are functioning. The test works by measuring airflow into and out of patient lungs using spirometer. To make a spirometry test, the patient sit and breathe into a small machine (spirometer). This medical device records the amount of air patient breathe in and out to measure the Forced Expiratory Volume in one second (FEV1) and the speed of patient breathe. The readings were recorded by the researcher. Spirometry tests used to diagnose asthmatic patients.

III: Workplace Observational Checklist: It was developed by the researcher based on Stobnika and Gorny. It included five preventive measures that should be available in the workplace to minimize the risks that may contribute to occupational asthma among workers. A) Flour dust control measures. B) Ventilation measures. C) Personal Protective Equipment. D) First aid facilities. E) Waste management measures.

**Ethical Consideration:** The research proposal and the tools were submitted to the Committee of Research Ethics at the Faculty of Nursing, Cairo-University. Approval to start the study was obtained on 28 May 2018. A written approval was obtained from the director of the medical sector at South Cairo & Giza Mills & Bakeries Company at 8, July 2018 to collect data from the workers who are working at El-Haram flour mill.

Also, written informed consents were obtained from the workers who were working at El-Haram flour mill after explaining the aim of the study, its benefits and risks if any, duration of the study, data collection tools and the procedure of the study. The researcher informed the workers that all data gathered during the study would be confidential and they had the right to withdraw from the study at any time without giving any reason and without any pressure from the head of the department. Besides, workers were informed that the obtained data would be used for the purpose of this study and it would not be reused in other studies except with their permission.

**Statistical Analysis:** The collected data were tabulated and analyzed using personal computer and statistical package for the social science (SPSS) program version 22. Descriptive statistics utilized were frequency, percentage, mean, and standard deviation.
Results

Findings is presented in three parts: 1) Description of flour mill workers’ personal characteristics. 2) Description of occupational asthma and lung function among flour mill workers. 3) Preventive measures applied in the flour mill.

Part I: Description of flour mill workers’ personal characteristics (Table 1): In relation to personal characteristics of flour mill workers, table (1) shows that, 51.6% and 23% of workers aged 45 to less than 55 and from 25 to < 45 years old respectively with a mean of 48.11 ± 8.61 years. Also, the table reveals that 40.1% of workers had work experience of 20 to less than 30 years while 18% had work experience of 1 - < 10 years with a mean of 17.86 ± 8.69 years. As for history of smoking, 17.2% were moderate smokers and 6.6% were heavy smokers.

Part II: Description of occupational asthma and asthma flare-up symptoms among flour mill workers (Tables 2 & figure 1). Regarding prevalence of occupational asthma, 100% of flour mill workers complained from occupational asthma. As indicated in figure (1), 31.1%, 27.9% of flour mill workers had moderate and intermittent degree of occupational asthma respectively. Concerning occupational asthma symptoms, table (2) shows that 68% of flour mill workers complained of persistent cough and 82% coughed up sputum on most days, 45.9% waked up at night from shortness of breath. Moreover, table (2) shows that 27.9% of workers exposed to asthma flare-ups in the form of sudden cough, wheezing, and shortness of breathing.

Part III: Description of degrees of airway obstruction based on scores of lung function (figure 2). As indicated in figure (2), 27.9% of flour mill workers had normal lung function while 36.9% of them had mild airway obstruction. Moderate and severe airway obstruction represented 18% and 17.2% respectively.

Part IV: Preventive measures applied in the flour mill (Tables 3 & 4). Regarding preventive measures applied by flour mill workers, table (3) shows that the available measures were only those that are undertaken by workers. Table (4) indicates that there were good working extraction units and all equipment were clean and in good repair, the rest of the preventive measures were not available.

Figure (1) Percentage distribution of occupational asthma degree among flour mill workers (n=122).

Figure (2) Percentage distribution of airway obstruction based on scores of lung function among flour mill workers (n=122).
Discussion

Concerning the prevalence of occupational asthma among flour mill workers, the current study revealed that all flour mill workers included in the study complained of occupational asthma. This finding was in agreement to some extent with the results of El-Gewily et al\textsuperscript{2} study done in two flour mills at South Cairo on 120 flour mill workers, they found that more than one quarter of them complained of occupational asthma. In addition, this finding was in agreement to some extent with Ajeel, & Al-yassen\textsuperscript{6}. Study done in flour mills at Basrah on 185 flour mill workers and found around half of flour mill workers complained of occupational asthma.

In relation to degrees of occupational asthma, the current study indicated that around one third of flour mill workers had moderated degree of occupational asthma and more than one quarter had intermittent degree of occupational asthma. The results of this study might be related to the flour mill workers who participated in the study had work experience for more than 10 years in the flour mill, this is according to Groene et al\textsuperscript{7}, they represented that continuous and prolonged exposure to flour dust increased likelihood of reported higher degree of occupational asthma.

Regarding occupational asthma symptoms that were prevailing among flour mill workers, the current study indicated that, all of the flour mill workers had occupational asthma symptoms, around half of them woken up with tightness in chest at any time and most of them had improved chest wheezing during holidays or weekend. They attributed the cause of their chest wheezing to the flour dust. These findings were consistent with El-Gewily et al\textsuperscript{2}, they found that all of flour mill workers had occupational asthma symptoms, one third of them woken up with tightness in chest at any time and a majority of them had improved chest wheezing during holidays or weekend.

In relation to degrees of airway obstruction based on lung function scores of flour mill workers, the current study revealed that more than one quarter of flour mill workers had normal lung function and more than one third of them had mild degree of airway obstruction. However, less than one quarter of them had either moderate or severe airway obstruction. These findings agreed to some extent with El-Gewily et al\textsuperscript{2} they found that, more than two thirds of flour mill workers had normal lung function and the quarter of them had mild degree of airway obstruction, while the minority of them had severe airway obstruction.

Regarding preventive measures applied by flour mill workers, the current study shows that the available measures were only those that are undertaken by workers as fast delivery of flour and short storage time of flour. Moreover, there were good working extraction units and all equipment were clean and in good repair, the rest of the preventive measures were not available. These findings were in agreement with Hosseinabadiet al\textsuperscript{8} who studied the relationship between lungs function and flour dust in flour factory workers in Iran and found lack of preventive measures in environmental conditions as improper ventilation systems and deficiency in equipment used in the milling process that led to excessive workload on the studied workers.

Conclusion

The results of this study indicated that occupational asthma was prevalent among all flour mill workers and all of them had definite occupational asthma symptoms. In addition, more than one third of them had moderate and severe airway obstruction. More than half of them had moderate persistent and severe persistent occupational asthma degree. Moreover, there were lack of most of preventive measures.

Recommendations: Based on the findings of this research, the following are recommended:

1. Periodic medical examination for early detection and early management of occupational asthma.
2. Pre-employment and in-job training for workers on preventive measures of occupational asthma.
3. More researches to study the effect of more potential confounding factors on the level of exposure, and effective ways of managing occupational asthma.

Author Contributions: All authors have contributed significantly to conception, design and execution of the study. All authors have participated in drafting, reviewing, and/or revising the manuscript, and have approved its submission.

Acknowledgments: All authors are grateful to all the workers who participated in the study.

Funding Statement: Self-funding. The authors received no funding from any individual, agency or organization

Conflicts of Interest: The authors declare no conflict of interest

E. Coli Bacteria Deactivation by Plasma Jet with Replica Plate Technique

Rana Talb Mohsen¹, Farkad Hawas Musa², M.D.T. Al-Gabore³

¹Department of Biology, College of Sciences, University of Anbar, ²Department of Biology, College of Education for Pure Sciences, University of Anbar, Ramadi, ³Department of pathology, College of Veterinary, University of Falluja, Al- Anbar, Iraq

Abstract

In this research, non-thermal plasma system (plasma jet) of argon gas is designed to work at normal atmospheric pressure and suitable for work as well as use in medical and biotechnological applications, also applied this technique in the treatment of The E. Coli bacteria and show the role of the applied voltage on the killing rate of bacteria, and we obtained a 100% killing rate during the time of 5 minutes.

Keywords: Plasma jet, applied voltage, E.Coli bacteria.

Introduction

Plasma, the fourth instance of the issue. Different instances of the substance are strong, fluid and gas, plasma, is ionized gas. The greater part of these substances known to mankind is plasma. For instance, enormous items, for example, stars are plasma. Be that as it may, there is likewise man-made plasma, utilized every day on our planet. Plasma is utilized in modern and in medicinal applications, in the plasma business are utilized in numerous advancements: plasma TV screens, lighting frameworks, and power frameworks. A moderately new zone is plasma use in biomedical applications and dentistry [1].

There are a few different ways to create non-warm plasma. Vitality is expected to deliver and support plasma. This should be possible in a few different ways: through warm, electrical, or photovoltaic vitality. Generally, a gas release happens electrically. For this situation, just [2].

(Electrons and particles) can get vitality from the electric field. At the point when these particles are in the minority, the warming of unbiased particles will be constrained. In this way, diffuse plasma where the division of ionizing species is under 0.1%, for the most part, non-warm. This mode is effectively accomplished under low weight, inside 10 to 1000 P. The impact of low weight is twofold: in uncommon gas ionization occasions uncommon, which keeps up a low charge thickness. In addition, the recurrence of impacts is adaptable among electrons and low particles, so electrons don’t have an extraordinary shot of transmission[3,4].

The temperature of the electron is usually greater 10⁴ K°, while the temperature of both particles and neutral ions depends heavily on the type of plasma produced Temperature can vary from approximately room temperature to 10⁷ K°. It is usually for each class of plasma components of its own degree the temperature of the \( T_e \) electrons and the positive ions of \( T_i \) and \( T_n \) neutral molecules. So it can be said that plasma is the only substance that contains several temperatures at the same time[5].

In this type of plasma ions and the temperature of neutral particles surrounding the same, the electron temperature rises much higher that any \( T_e \gg T_i \gg T_n \) in the cold plasma, most of the processing energy in the electrons in the plasma, this produces effective electrons instead of gas heating as a whole, because Ions and neutral components remain relatively cool This feature will enable us to use (plasma) to process sensitive materials, including biological tissue [6].

Escherichia coli (E. coli) bacteria contribute to many infections in hospitals such as surgery and burns. At present, bacterial resistance has increased for many drugs[7, 8]. The colonies may appear in blood agar (3-4 cm), Mac Conkey agar, in the colonies appeared red and these bacteria appeared in the form of fermentation of lactose [7, 8, 9].
**Experimental Procedure:** To generate the discharge of the air gap between two poles covered with insulation, use a high frequency digital oscillator to measure current and voltage as well as high voltage power source. Applied voltage, discharge current measured and analyzed.

Plasma jet system is based on a conventional plasma discharge which is basically a system driven by alternating current. High voltage is applied between two conductors where one or both are covered with a dielectric to limit the current and to prevent transition to an arc.

Cold plasma is produced by alternating voltage applied (1-30 kV) between an insulated high-voltage electrode and the grounded base holding the sample.

A variable voltage and current power supply was used for treating samples. The power supply was connected to stainless steel tube.

The dielectric prevented current flow between electrodes, creating plasma with high reactive species concentrations but minimal gas heating, the discharge distance between the dielectric and the sample was (1-3 cm).

In (13 kHz), to limit the current and to prevent transition to an arc. Fig. 2, shows the schematic diagram of the experimental set-up used in study. System is equipped with a high voltage (1-30 kV) connected to a stainless steel wire, the other part connected to the mica to prevent the discharge of the catcher.

Between the upper surface of the model and the bottom surface of the tube, the discharge occurs. The distance between discharge (1-3 cm) and the diameter of the glass tube (2.5 cm)

All the treatments are at room temperature and atmospheric pressure and were carried out according to the same procedure.

**Method**

Midstream Urine samples (MSU) and burns swabs were obtained from patients with urinary tract infections (UTIs) and burns respectively, these samples were cultured on culture media to isolate bacterial colonies. After that, bacteria were identified by means of highly specific tests. *Escherichia coli* (*E.coli*).

**Results and Discussion:**

According to replica plating technique, the effects of the plasma jet treatment on *E. coli* bacteria were studied. The bacteria were killed in different percentages depending on the experiments conditions. Killing percentage as a function of the plasma treatment time for different conditions was presented in figures The results show that the killing percentage increases with the increasing of treatment time for all applied voltages and gap distances. Also, it was clear, killing rate for bacteria increases with increased voltages while it was decreases with the increasing of the gap distance. That is the general behavior of the killing percentage according to the results.

In figure (2), the applied voltage is 13 kV and when the gap distance is 3 mm, the killing percentage for *E. coli* is 20% in 180 sec, then killing rates for bacteria increase with increased plasma processing time (exposure time). It was increased up to 70% in 270 sec.

![Figure 1: shows killing rate of E. coli with treatment time and at different distances of the gap in the frequency and voltage (17 kHz, 13 kV)](image)

When the gap distance is 2.5 mm, the killing percentage for *E.coli* bacteria increases up to 84% at 270 sec, while when the distance between electrodes 2 mm, the killing percentage up to 90% at same period. Finally, when the distance between electrodes becomes 1.5 mm, the killing percentage was 90% with increase for plasma treatment time, then increases to 94% at plasma treatment time 270 sec.

However, the best result of killing percentage resulted from gap distance shorter and plasma treatment time longer, when gap distance 1.5 mm, killing percentage arrives to 94% in 270 sec, as long time effects with little on bettering killing percentage in 270 sec because interaction between *E.coli* are almost completed through
this time. These curves indicated that killing percentage became high with an increasing treatment time within 270 sec. However, a longer time had little effect on improving the killing percentage after 270 sec. This was because the interaction between bacteria and reaction species was almost complete within 270 sec.

In figure (3), when applied voltage 17 kV, killing percentage for *E. coli* bacteria differs with different gap distances between electrodes, when distance 3 mm, it increases with increasing plasma treatment time and rest in 120 and 180 sec respectively, where it 50%, may be because less period, beyond this period, it increases more to 80% and rest with increasing plasma treatment time, where no effect on killing percentage with increasing plasma treatment time.

When the distances 2 mm and 2.5 mm the killing percentage increases with increasing plasma treatment time. While distance 1.5 mm, the killing percentage increasing in 60 sec, and it rest on 50% to time 120 sec, then increases to 96%, this favorite expectant value when plasma treatment time 270 sec, at 17 kV, the electric field dense in little gap distance, cold plasma generated by (plasma jet) which is active consequently, the plasma (jet) produced is more abundant for reaction species and connected with bacteria and led to efficiency for large killing percentage for bacteria with converted high energy \[10\].

**Figure 3:** Shows killing rate of *E. coli* with treatment time and at different distances of the gap in the frequency and voltage (17 kHz, 22 kV)

Figure (5) shows the typical sample for the killing of *E. coli* bacteria 84% at 4.30 sec when applied voltage 13 kV and gap distance is 2.5 mm at room temperature.

Bacteria killing is attributable for active various species produced by plasma. The plasma efficiency killing percentage was dependent on the treatment time, air-gap distance, and the applied voltage. Within less than 5 min of plasma exposure, 97% killing efficiency must be completed for *E. coli* bacteria.

**Figure 4:** Typical sample for the killing percentage of *E. coli* bacteria 84% at 4.30 sec on MacConkey agar.

**Conclusion**

Non-thermal plasma (cold) was manufactured using air pressure and used as an application for sterilization of
E. coli. At different volts (13, 17 and 22 kV), the bacteria are disrupted in 5 minutes. The sterilization efficiency improves with increased voltage applied. Through active species such as oxygen OH, N\textsubscript{2} which appeared in the plasma jet, which oxidation and bombardment of the bacterial cell and inhibition.

Pulmonary Rehabilitation for People with Pulmonary Tuberculosis: A Concept Analysis Based on Walker and Avant Approach

Nur Akbar¹, Astuti Yuni Nursasi¹

¹Faculty of Nursing, Universitas Indonesia, Kampus FIK UI, Jl. Prof. Dr. Bahder Djoohan, Depok, Jawa Barat

Abstract

Background: Pulmonary Tuberculosis is greatly contributing to global illness and death. Pulmonary rehabilitation needed to maintain and improve the quality of life and health status of pulmonary TB patient.

Material and Method: A Concept Analysis based on approach Walker and Avant with eight steps were conducted. Relevant studies published from 2000 to 2017, in English language, full article, and retrieved from Pubmed, CINAHL, Wiley online library, SAGE with the keyword “pulmonary rehabilitation”, “pulmonary rehabilitation and Tuberculosis” and “lung rehabilitation and Tuberculosis”.

Findings: The concept analysis revealed that pulmonary rehabilitation program is consists of several programs by the following attributes: physical exercises, breathing exercises, educational program, nutritional support and psychological interventions that can enhance the quality of life and health status of people with pulmonary TB.

Conclusion: This analysis provides nurses with a new perspective by helping them to gather all the components within the concept of pulmonary rehabilitation that nurse can do. It is expected that understanding the nature, as well as the key elements of the concept, would assist with analyzing the existing pulmonary rehabilitation program and help to increase health status and quality of life of people with TB.

Keyword: Tuberculosis, Pulmonary Tuberculosis, Pulmonary Rehabilitation, Concept analysis, Companionship.

Introduction

Tuberculosis (TB) is still becoming a global problem. World Health Organisation (WHO) reports there are 10.4 million TB patients in 2015 and TB deaths of 1.8 million. 95% of deaths in lagging and developing countries. The presence of TB resistant provides an additional burden to this disease (¹).

TB is an infectious disease caused by Mycobacterium tuberculosis but it is unlikely to the other infectious diseases, TB is a chronic disease that effects in multiple acute and sub-acute complications (²,³). The Occurrence of Mycobacterium tuberculosis infection due to decreased immune system. Immune system disorder in severe conditions will cause malnutrition due to lack of food intake that caused by anorexia, malabsorption and increase use of nutrients in the body (⁴). Mycobacterium Tuberculosis destroys the histopathology of the pulmonary parenchyma (⁵,⁶,⁷). Other study reported pulmonary impairment after TB treatment that impacted in a decrease in health status (⁸).

Pharmacologic interventions for people with TB have been widely applied in the form of anti-TB treatment for at least 6 months for TB disease with category 1 (⁷). In countries with the largest TB populations such as India and Indonesia, active TB provides a greater burden than expected estimates and leads to decrease in prolonged lung function and the quality of life (⁹,⁵,¹⁰).
Companionship treatment needed to maintain and enhance the quality of life and health status of TB patient. One of program that can be resolve is pulmonary rehabilitation. Pulmonary rehabilitation has an important role in the management of chronic lung disease and gives considerable results \(^{(11)}\).

**Matherials and Method**

This study is a concept analysis that obtained from various sources such as Pubmed, CINAHL, Wiley online library, SAGE with the keyword “pulmonary rehabilitation”, “pulmonary rehabilitation and Tuberculosis” and “lung rehabilitation and Tuberculosis”. The inclusion criteria of articles included: articles published through the year from 2000 to 2017, full article and using English language. The method was based on Walker and Avant that consisting of eight step.

**Findings**

**Identifying Uses of the Concept of Pulmonary Rehabilitation:** The American College of Chest Physicians (ACCP) and the American Association of Cardiovascular and Pulmonary Rehabilitation (AACPR) define pulmonary rehabilitation as a comprehensive, evidence-based and multidisciplinary intervention of patients with chronic respiratory disorders and decreased daily activity which aims to enhance the quality of life by improve health status, effectiveness of treatment, reduce symptoms, reduce maintenance costs and increase lung function capacity \(^{(13)}\).

The research on pulmonary rehabilitation has been mostly done for chronic obstructive pulmonary disease. However, research on pulmonary rehabilitation of TB to patients during anti-TB and home-based treatment is still very limited. One finding of lung rehabilitation studies conducted in tuberculosis patients for 6 weeks on a home basis showed an increase exercise tolerance and vital capacity in people with Pulmonary TB (\(n = 34\)) \(^{(14)}\). Another study of home-based pulmonary rehabilitation performed on restrictive lung disease group for 8 weeks showed an increase respiratory muscle strength, exercise tolerance and quality of life \(^{(15)}\).

**Determining Defining Attributes:** In principle, the pulmonary rehabilitation process includes physical training programs, breathing exercises, education, and nutritional supported by involving multi-professional teams and families in accordance with the needs of patients \(^{(16)}\). Pulmonary rehabilitation can conduct at home, polyclinic or hospital which can applied at home that do not require special equipment includes physical exercise, breathing exercises, education, nutritional support and psychological interventions.

**Physical training:** Physical exercise is important to make people with TB stay fit during the treatment. Physical exercise in patients with TB adapted to the conditions and the abilities. The recommended exercises include endurance training and upper and lower limb strength training\(^{(17)}\). Regular physical exercise will increase the immune system, respiratory function, assist in the performance of daily activities, reduce systemic pressure, improve lipid profile, fight depression, reduce anxiety and make sleep easier\(^{(18)}\). Physical training is emphasized on intensity, specificity and reversibility. Regular physical exercise every day gives better results. When physical exercise is stopped, it will cause a loss of exercise effect \(^{(19)}\). Physical exercise is adjusted for disease severity, symptom limitation, comorbidity, and motivational level of the patient during pulmonary rehabilitation. Under the American Thoracic Society (ATS) guidelines, physical exercise in a pulmonary rehabilitation program is conducted at least 20 sessions (divided 2-3 times/week) to achieve physiological benefits \(^{(20)}\).

**Breathing exercises:** Respiratory exercise is to improve regional ventilation, gas exchange, respiratory muscle function, dyspnea, exercise tolerance and the quality of life. Recommended breathing exercises include pursed-lip-breathing techniques, active expiratory, diaphragmatic breathing, breathable coordination and activity \(^{(20)}\). Breathing exercises are combined with physical exercise with a minimum of 15 minutes of breathing exercises \(^{(19)}\).

**Education:** Education focuses on improving self-efficacy in TB patients as well as in families in supporting the success of treatment, including adherence to improved health behaviors \(^{(21, 18)}\). Education taught is breathing strategy, normal respiratory function, TB disease pathophysiology, correct use of drugs, exercise benefits, appropriate diet, avoidance of irritant, relaxation techniques and stress management\(^{(20)}\).

**Nutrition Support:** Nutrition plays an important role in supporting the healing of TB disease\(^{(22, 23)}\). Poor nutrition is seen in low body weight and abnormalities of body composition such as small arm circumference that contribute to morbidity associated with decreased
the respiratory muscle strength, exercise tolerance and health status. Good nutrition contributes positively the respiratory muscle strength. One study of TB in Indonesia in active TB patients experiencing malnutrition revealed anemia, low concentrations of retinol and zinc plasma. Micronutrients such as Vitamin A and zinc increase the effectiveness of anti-TB drugs.

Psychological Intervention: The need for psychological interventions during illness is important because people with chronic illness exhibit altered mental status resulting in risky behaviors such as disobedience, unhealthy lifestyle changes (such as smoking, drinking alcohol) and engaging in sexual practices that are not secure. Patients with TB experience high levels of stress and decreased the quality of life. Psychological interventions increase life expectancy and adherence to medication and treatment outcomes.

Model Case: Mr.A 34-year-old is a head of household with 2 children who was diagnosed with pulmonary TB and undergoing treatment for 2 weeks. Mr.A lives in a low-income country. Ayu is a nurse in community who assigned to take care of Mr.A who is taking medication again. Nurse Ayu has reviewed Mr. A and found the data that Mr.A is still coughing and looks very thin, the weight only 45 kg with a height of 170 cm. Based on result interview, nurse Ayu found data about Mr.A had a not good knowledge about TB especially the cause of the illness and the danger of TB transmission. Mr.A also felt embarrassed and stressed by his illness because the people around him shunned him and were fired from his job.

Analysis: This case illustrates the complexity problems by TB patients. Thus, this case can not only be treated with treatment alone but also requires additional treatment. Poor patient condition, lean, low knowledge and embarrassment of having TB disease require a pulmonary rehabilitation program to maintain the condition. Pulmonary rehabilitation programs with home visits will help to maintain the condition of TB patients. Giving education related to TB disease, will help improve TB patient behavior regularly and complete TB treatment and prevent further transmission. Giving education is also given to the family as a support system for TB patients. Physical and breathing exercises and nutritional support will help maintain the physical condition of TB patients. Psychological interventions are conducted to increase the confidence of TB patients and not feel ashamed of their condition.

Antecedents and Consequence: Walker and Avant have defined antecedents as incidents that happen before the existing concept and consequence as incidents that happen as results of the concept. Until recently, there has been no clarity of the duration of standard lung rehabilitation programs to be applied, but several studies show that the longer the lung rehabilitation is applied giving the better benefit. Bolton et al recommended lung rehabilitation performed 6-12 weeks to provide significant benefits to improve the health status of patients with chronic respiratory disorders. Other studies have shown that pulmonary rehabilitation programs improve quality of life and peak VO2 in the lung TB group Sequelae for 8 weeks. Pulmonary rehabilitation above 9 weeks was able to improve significantly the post-TB group in activity scores, MRC, dyspnea transition index at the same level of disability in chronic obstructive pulmonary disease but not significant in lung expiratory volume and 6 MWT.

Several conditions contraindicated with pulmonary rehabilitation such as heart failure, pulmonary hypertension, inability to exercise for orthopedic reasons, unstable diabetes, psychiatric illness, dementia, lack of motivation, disobedience and unwillingness to rehabilitate. Other studies have reported obstacles following the pulmonary rehabilitation program to be present and submissive like patients who cannot quit smoking, live alone and in poor condition. Therefore, prior to pulmonary rehabilitation is very important to assess the history, ability and willingness of patients with pulmonary TB in supporting the success of pulmonary rehabilitation programs.

Defining Empirical Referents: Defining empirical referents is the final step of Walker and Avant’s method of concept analysis. Empirical references present how the concept is to be measured or evaluated. Several instruments can be used to measure and evaluate of pulmonary rehabilitation program.

Physical exercise can be measured using a 6-minute (or 12-minute) walking test (SMWT) or Shuttle Walk Test (SWT). SMWT is the most commonly used test for pulmonary rehabilitation, the way is to ask the patient to walk as far as possible at the appointed time.

To measure the degree of shortness of breath can use the Medical Research Council (MRC) dyspnoea scale or Modified Borg Scale. The Medical Research Council (MRC) dyspnoea scale is a measuring tool.
for assessing the effects of shortness of breath on daily activities consisting of five statements. While Modified Borg Scale is a scale used to measure the degree of shortness of breath during exercise by selecting the number corresponding to the congested condition at the time\(^\text{(30)}\).

To measure the quality of life in general it is possible to use the Short-Form 36-item questionnaire (SF-36) or for respiratory diseases can use Chronic Respiratory Disease Questionnaire (CRQ), Self-reported Chronic Respiratory Questionnaire (CRQ-SR), St. George’s Respiratory Questionnaire (SGRQ). They are all valid life quality measures\(^\text{(30,35)}\).

To measure the condition of psychology can use Hospital Anxiety and Depression scale (HAD). This scale consists of 14 assessment items to measure the condition of anxiety and depression of the patient\(^\text{(30)}\).

**Conclusion**

Pulmonary rehabilitation is an evidence-based intervention for patients with various chronic respiratory diseases like TB. Appropriate home-based lung rehabilitation includes physical exercise, breathing exercises, education, nutritional support and psychological intervention. The analysis in this paper can encourage nurse to provide effective nursing intervention for people with TB through pulmonary rehabilitation.

**Conflict of Interest:** There was no personal matters that may pose a conflict of interest in this study.

**Source of Funding:** This study funded by the Directorate of Research Services to the University of Indonesia.

**Ethical Clearence:** Ethical Clearence taken from the Ethics Committee of the Faculty of Nursing of Universitas Indonesia No. 147/UN2.F12.D/HKP.02.04/2017.

Abstract

Vascular dystonia is manifested in several variants. Its cardiac type is characterized by tachycardia, arrhythmia and cardialgia. Vegetative-vascular dystonia by hypertonic type is manifested by increased pressure. Hypotonic neurocirculatory dystonia is manifested by the phenomena of vascular insufficiency. Frequent symptoms here are low blood pressure, headaches, muscle weakness and chills. Great difficulty is the diagnosis of vascular dystonia by hypertensive type, as the symptoms are characteristic of many diseases. For the rehabilitation of patients with vascular dystonia need to use a set of therapeutic measures, which should be based on physical therapy. Its basis for vascular dystonia are feasible physical exercises of a General developing nature, breathing exercises, therapeutic walking, walking barefoot, with the use of wipes with cold water, therapeutic massage, physiotherapy.

Keywords: Vascular dystonia, vessels, heart, pathology, physiology.

Introduction

Vegetative-vascular dystonia is a polyetiologica syndrome caused by violations of vegetative regulation of the heart, vascular tone, functioning of internal organs and endocrine glands, leading to a decrease in the adaptive capacity of the body¹,².

Diagnosis of vascular dystonia is not defined in the International classification of diseases-10 as a separate nosological unit³. Vegetative disorders similar to vegetative-vascular dystonia can often be a part of a number of diseases: endocrine pathology, hypertension, coronary heart disease⁴,⁵.

In neurocirculatory dystonia, the patient usually complains of cardiac abnormalities or pressure surges⁶. Therefore, vascular dystonia is often considered as a group of symptoms⁷,⁸.

The presence of concomitant diseases in vascular dystonia is one of the main problems in the diagnosis of dystonia⁹,¹⁰. For example, in case of vegetative-vascular dystonia, the patient may be diagnosed with hypertension according to the hypertensive type, taking into account the sharp pressure jumps¹¹. In this case, despite the fact that every effort is made to treat this disease, it may not be entirely successful¹². In this regard, the paper aims to consider the main issues of vascular dystonia.

Variants of vegetative-vascular dystonia. Cardiac type of vascular dystonia is characterized by rapid heartbeat, tachycardia, arrhythmia and cardialgia. Vascular dystonia of hypertensive type is manifested by an increase in pressure that occurs imperceptibly for a person, for the detection of this symptom, regular measurement of blood pressure is necessary¹³,¹⁴.

Hypotonic neurocirculatory dystonia is manifested by some vascular insufficiency. Frequent symptoms are low blood pressure, headaches, muscle weakness and chills¹⁵. It is the diagnosis of neurocirculatory dystonia of the hypertensive type that causes great difficulty, since the symptoms are typical for many diseases¹⁶,¹⁷.

Corresponding Author:

e-mail: ilmedv1@yandex.ru
Tel +79102732263
Now the issues of terminology, pathogenesis, classification, diagnosis and treatment of vegetative disorders are discussed\textsuperscript{18}. Neurocirculatory dystonia can simulate rheumatism, hypertension, non-rheumatic myocarditis\textsuperscript{19}.

**Syndromes of vascular dystonia:** Cardialgic syndrome is observed in 80-100\% of patients with vascular dystonia. It is based on violation of the tone of coronary arteries, hyperventilation of the lungs, hypercatecholaminemia and irritation of the sympathetic plexus of the heart\textsuperscript{20,21}.

The features of cardialgic syndrome in vegetative-vascular dystonia are various kinds of pain in the heart—patients complain of burning, gnawing, pressing pain in the heart, which can be of different intensity and localization, most often in the apex of the heart. There may also be chest pain, which are migratory in nature, and their duration varies from a few minutes to several hours\textsuperscript{22}. There is a clear connection between the occurrence of cardialgia with psychoemotional stress situations, mental and physical overstrain, alcohol intake, weather change, with the premenstrual period and sleep disorders\textsuperscript{23}. The rhythmic nature of pain is peculiar – disappearance or significant reduction of cardialgia in the distraction of the patient’s attention and their resumption when the patient’s attention returns to normal daily life\textsuperscript{24}. Pain in vascular dystonia in the heart always occurs at the wrong time, and after physical or emotional stress\textsuperscript{25}.

For patients with vascular dystonia with hypertensive syndrome characterized by a significant increase in cardiac output minute mainly due to the shock volume of the heart. At the same time, the total peripheral resistance may decrease\textsuperscript{26}. The main manifestation of the hypertensive syndrome is complaints of heartbeat, pulsation of the vessels of the neck or head, “fading”, “stopping” of the heart\textsuperscript{27}. With excitement, changing the position of the body, hyperventilation of the lungs, there is an increase in the pulse. In connection with ventricular extrasystole, there are feelings of “stopping” and “fading” of the heart\textsuperscript{28}. Physical activity leads to a decrease in the frequency of extrasystoles or to their complete disappearance\textsuperscript{29}. There is no atrial fibrillation and no signs of congestive heart failure\textsuperscript{30,31}.

Hypotonic syndrome is manifested by a decrease in blood pressure on emotional stress, physical activity, the transition from a horizontal to a vertical position. Lowering of blood pressure is tolerated by patients in different ways\textsuperscript{32}.

Foundations of physical rehabilitation in dystonia. Taking medication is not key in the treatment of vascular dystonia. The basis in the fight against it is to strengthen the body’s ability to adapt to changes in the environment, increasing resistance to nervous overstrain\textsuperscript{33}.

For the treatment of hypertensive type of vascular dystonia requires a radical change in lifestyle and clear self-control. An important role is played by compliance with the diet and sleep. Practice of the treatment of vascular dystonia on hypertonic type shows that in many cases much more effective than medical treatment are auto-trainings and rational psychotherapy\textsuperscript{34}.

Vascular dystonia hypotonic type requires a comprehensive approach to treatment, taking into account the existing symptoms. At the same time, special emphasis should be placed on the combination of drugs\textsuperscript{35}.

Discussion with a psychologist stressful situations that cause vascular dystonia, can gradually reduce the frequency and duration of pain in the heart or blood pressure disorders, and eventually completely get rid of them. Meditation also has a positive effect on the course of treatment, which helps to deal with the cause of all forms of vascular dystonia, if they are due to psychological factors\textsuperscript{36}.

The basis of medical treatment for vegetative-vascular dystonia is natural adaptogens, stimulants, vitamin and mineral complexes. Patients with vascular dystonia must be prescribed intake of b vitamins and magnesium preparations. From sedatives prefer drugs of plant origin. As a General tonic for vascular dystonia, means improving tissue metabolism are used. Medicines with a tonic effect it is advisable to appoint a stimulant of the Central nervous system\textsuperscript{37,38}.

The basis of medical treatment for vegetative-vascular dystonia is natural adaptogens, stimulants, vitamin and mineral complexes. Patients with vascular dystonia must be prescribed intake of b vitamins and magnesium preparations. From sedatives prefer drugs of plant origin. As a General tonic for vascular dystonia, means improving tissue metabolism are used. Medicines with a tonic effect it is advisable to appoint a stimulant of the Central nervous system\textsuperscript{37,38}.

To quickly restore the physiological balance in the cardiovascular system in vegetative-vascular dystonia, it is necessary to use a set of therapeutic measures, which should be based on physiotherapy\textsuperscript{39,40}. Its basis for dystonia are feasible exercise General developmental nature, breathing exercises, exercises for the calf muscles, therapeutic walking, Walking barefoot, using wipes with cold water, therapeutic massage, therapeutic exercise\textsuperscript{41,42}. Also, the rehabilitation complex should include massage, therapeutic showers and baths, reflexology\textsuperscript{43,44}.
Conclusion. Vascular dystonia is becoming more common in the modern world. Manifested heart type hypertonic type hypotonic and type. To quickly restore the physiological optimum in the cardiovascular system with vascular dystonia, a set of therapeutic measures should be used, which should be based on physical therapy. It is based on vascular dystonia are feasible physical exercises of a General developing nature, breathing exercises, therapeutic walking, Walking barefoot, with the use of napkins with cold water, therapeutic massage, physical therapy.

Conflict of Interest: No Conflict of Interest is declared.

Sources of Financing: The study was conducted at the expense of the authors.

Ethics Committee Resolution: The study was approved by the local ethics committee of the Russian State Social University on September 15, 2017 (protocol №11).

Assessment of Nurses Staff Knowledge Regarding Chest Pain Management and Respiratory Maintains in Cardiac Care Unit

Younus Khudhur Baeez¹, Shelan Qahraman Shakor¹, Suhailah Mohammed Ali²

¹Department of Adult Nursing, ²Maternal and Child Health Nursing, College of Nursing, University of Kirkuk, Iraq.

Abstract

Background: Chest pain is a common complaint and encompasses a broad differential diagnosis that includes several life-threatening causes.

Objective: The study aimed to assess nurses knowledge regarding chest pain management and respiratory maintains in Cardiac Care Unit

Methodology: A quantitative design (a descriptive study) was carried out to assess nurses knowledge regarding chest pain management and respiratory maintains in cardiac care unit. A non-probability (purposive) sample of (44) nurses who work in CCU unit at Azady teaching Hospital and Kirkuk general Hospital in Kirkuk city. the tools of data collection consisted of (25) items which divided to three parts. Part one, Nurses demographic characteristics, Part two deal with chest pain and part three is the respiratory maintains assessment. The data were collected through the utilization of constructed questionnaire, interview technique. The data were analyzed through descriptive statistical analysis and inferential statistical analysis.

Results: A total of 44 nurses participate in the study, the study shows that (61.4%) of the samples age were (20-30) years old, (63.6%) were male. (68.2%) of them Graduate B.Sc. of Nursing, and (45.5%) of the sample has 1-5 years’ experience in Cardiac Care Unit. The relative sufficiency for the chest pain assessment was (69.1) while the relative sufficiency for the maintains respiratory was (87.8).

Conclusions: Based on the result, the study concluded that most of the samples were between (20-30) years, male, Graduate B.Sc. of Nursing, has 1-5 years’ experience in Cardiac Care Unit. According to the grand mean of scores, the nurses has moderate knowledge regarding chest pain management while they have high knowledge regarding respiratory maintains

Keywords: Chest Pain, Respiratory Maintains, Cardiac Care Unit, Heart Disease, Knowledge.

Introduction

The cardiac care unit is a place which produce a highly technological management to critical heart condition.(1) The care in the CCU focus on relief of chest pain and provide adequate air way maintains.(2) The cardiac care nurse have the responsibility of ensuring that all critically conditions will receive optimal nursing.(3) The nurse who work in the CCU is more important than the equipment, therefore, nurses must have adequate knowledge and skills to manage these critical illness.(4) The CCU nurse’s knowledge and skill must be directed towards reliving chest pain and maintains air ways.(5) Chest pain is a common complaint and signs in heart disease and encompasses a broad differential diagnosis that consist series causes. Coronary heart disease is the cause in up to 25% of cases. Because acute chest pain, depending on its etiology, may be associated with a high risk of death, rapid, goal-oriented management is mandatory.(6) Chest pain assessment and management can be a faces clinical problem for nurses; assessment of the pain is especially difficult when done retrospective as commonly occurs into outpatient settings and during
hospital admission procedure.\(^{(7)}\) The ability of cardiac patient to explain the characterize of their suffering from pain influence the prose of diagnosis and therapeutic management.\(^{(8)}\) Chest pain is the most common presenting symptom of coronary heart disease (CHD). The effective assessment and management of patients with chest pain is central to any strategy to reduce the burden of coronary disease.\(^{(9)}\) The airway suctioning was one of the most common expert interventions which were used for patients with respiratory disorders.\(^{(10)}\) he air way suctioning is an essential component in airway management in patients on mechanical ventilation, being one of the most frequently performed invasive procedures in the Intensive Care Unit (ICU). Its main goal is to remove accumulated lung secretions in order to maintain the airway’s permeability; provide adequate oxygenation; reduce the risk of Ventilator-Associated Pneumonia (VAP) and prevent pulmonary consolidation and atelectasis.\(^{(11)}\) Therefore, it is imperative that this procedure is performed with professional competence, which means not only having the necessary skills, but also knowledge based on updated scientific evidence, guaranteeing efficiency and the safety of the patient.\(^{(12)}\) Nurses to be skillful at the airway management, they must have knowledge of the important anatomical, physiological, and pathological features related to the airway as well as knowledge of the various tools and Method that have been developed for this purpose.\(^{(13)}\) Considering the importance of nurses’ responsibility in chest pain management as well as their responsibilities in maintains of respiratory, the aim of the study was to assess nurses knowledge regarding chest pain management and respiratory maintains in cardiac care unit.

Methodology

**Design and Sample:** A quantitative design (a descriptive study) was carried out to assess nurses knowledge regarding chest pain management and respiratory maintains in cardiac care unit. A non-probability (purposive) sample of (44) nurses who work in CCU unit at Azady teaching Hospital and Kirkuk general Hospital in Kirkuk city. To reach the purpose of the study, A pilot study was carried out to determine the questionnaire reliability through the use of (Test – Retest). The questionnaire was constructed based up on the extensive review of related literature of researchers, the tools of data collection consisted of (25) items which divided to three parts. Part one, Nurses demographic characteristics, which concern with the personal information and it contains four items which includes ( Nurses age, gender, level of education, years of experience in CCU). Part two deal with chest pain assessment and it is composed from 13 items, and part three is the respiratory maintains assessment which contain eight items. The data were collected through the utilization of constructed questionnaire, interview technique with nurse work in CCU. Consent informed was granted from nurses for participation in the present study was obtained and the interview was carried out individually. The data were organized and coded into computer files by using the Statistical Package for Social Science (SPSS) version 15 with application of descriptive statistical analysis which include (frequency, percentage, mean, and grand mean of score) and inferential statistical analysis which include (relative sufficiency).

Discussions

Chest pain is one of the most common symptoms for which adults seek the care of a physician. Because the probable etiology often can be determined from the history alone., the nurse should systematically evaluate characteristics of the pain. (14) Many patients present to the CCU department with chest pain. It is important to identify those patients with acute coronary syndromes (unstable angina, acute myocardial infarction, or evolving infarction). (15) Studies reported an improvement in outcome for patients followed up by a multidisciplinary care team in which a nurse was a key player. Such level of care is now recognized in international guidelines. (16) More recent emphasis on the management of heart disease has led to a focus on the contribution by nurses to the entire chest pain their roles in improving patient outcome and the delivery of quality care. (17) The management of acute breathlessness or cardiopulmonary instability is generally carried out simultaneously with diagnosis. Nurse have used consensus methodology to map clinical knowledge and skills as a process to develop ongoing educational and training activities. (18) This review reports the exploration of evidence based-respiratory clinical guidelines as a frame of reference for the essential clinical skills and knowledge required at ward level to ensure registered nurses are adequately prepared to provide the highest level of clinical care to adult patients. (19) This respiratory knowledge and skills could be the basis for education and skill development training for ward-based nurses to reduce any inconsistencies in the delivery of bedside care to the patient of equal importance is the maintenance of ward-based nurses’ ability to carry out technical and non-technical skills through regular opportunities to update their knowledge of the latest evidence associated with their ward-based practice. (20)

Conclusion

Based on the results of the study, it is concluded that the nurse staff have inadequate knowledge regarding chest pain management, while they have adequate knowledge regarding respiratory maintains.

Morphological and Molecular Study of Contracaecum Larvae with a New Record of Contracaecum Septentrionale in Al-Sanaf Marsh Southern Thi-Qar Province, Iraq

Zainab Abd-Ali Mohammad, Mohammad Kareem Hbaiel

Abstract

Contracaecum nematodes are the most significant genus of the Anisakidae because of their wide range of host species involved in their life cycles, large number of their species and their health impacts. The current study aims to present the morphological and molecular characters of fourth stage larvae of Contracaecum that isolated from N. nycticorax proventriculus as free larvae in al-Sanaf marsh, southern Iraq. Larvae of Contracaecum spp. collected from proventriculus of N. nycticorax aquatic birds were studied morphologically and their genomic DNA isolated, the ITS-1 regions of rDNA amplified by PCR technique. Sequences alignments carried out to screen nucleotide variation in ITS-1 among samples. The alignment of the sequences between Contracaecum larvae in current study with the previously reported reference gene sequences in the GenBank showed two distinct species. The first Contracaecum septentrionale recorded for the first time in Iraq and submitted to GenBank with the accession numbers MK424799.1, the second Contracaecum microcephalum submitted to GenBank with the accession numbers MK424795. The analysis of the ITS-1 data for Contracaecum larvae supported the distinction between species of Contracaecum larvae.

Keywords: Contracaecum, Larvae, ITS-1, Southern Iraq.

Introduction

The genus Contracaecum (Railliet & Henry, 1912) are parasitic nematodes with global distribution, they belonging to the family Anisakidae. Contracaecum nematodes are the most significant genus of the Anisakidae because of their wide range of host species involved in their life cycles, large number of their species and their health impacts. Contracaecum throughout its life cycle is able to infect both terrestrial and aquatic animals (marine and freshwater), which include a wide range of vertebrates and invertebrates. This genus related to Anisakidae family and has over 100 species. If humans are excluded from their host list, it is the only member of Anisakidae with zoonotic significance. Free or encapsulated third-stage larvae of Contracaecum species infect invertebrates and fish as their intermediate and paratenic hosts; whereas, adult nematodes infect piscivorous birds and marine mammals as their definitive hosts. Contracaecum larvae in humans cause a severe and painful condition following ingestion of under-cooked or raw fish which carrying third-stage larvae. These larvae cannot be identified to species level without the aid of molecular tools. In Iraq Contracaecum nematodes were isolated from many intermediate and final hosts there is no specific identification based on genetic characterization for Contracaecum larvae, according to current standards for identification of these parasites. The current study aims to present the morphological and molecular characters of fourth stage larvae of Contracaecum that isolated from N. nycticorax proventriculus as free larvae in al-Sanaf marsh, southern Iraq.

Material and Method

Larvae of Contracaecum spp. collected from N. nycticorax proventriculus as free larvae, physiological
saline used for washing larvae extensively then a small piece of the mid-body of each individual larva removed for molecular study; the rest fixed in 70% ethanol then cleared in lactophenol for morphological examination. Light microscopy used for studding the collected larvae morphologically and characters of systematic importance measured. All measurements made directly with an eyepiece micrometer and drawings made to scale with the aid of a camera lucida. Larvae of *Contracaecum* morphologically identified according to the identification keys of Deardorff and Overstreet, Peter and Maillard. Genomic DNA from *Contracaecum* larvae isolated by DNA kit (Geneaid, Tywan). The ITS-1 regions of rDNA was amplified by PCR with oligonucleotide primers (Macrogeny, Korea). The forward (5'-TTC CCC CTT TGT GAA CCT GC-3') and reverse (5'-CGA TCC ACG AAC CGA GTG AT-3'). The PCR (in 20μl) performed in 5μl Master Mix, 1 μl of forward primer, 1 μl of reverse primer, 5 μl of DNA template and 8 μl of PCR water (Bioneer, Korea) in a thermocycler (Biometra) under the following cycling conditions: 95°C for 2min (initial denaturation), followed by 30 cycles of 95°C, 30s (denaturation), 59°C, 30s (annealing), 72°C, 60s (extension) and a final extension of 72°C for 5min. One microlitre (10–20ng) of genomic DNA was added to each PCR reaction. An aliquot (5μl) of each amplicon examined on a 1%w/v agarose gel, stained with ethidium bromide, and photographed.

**Results**

The *Contracaecum* larvae were whitish nematodes, they were in fourth developmental stage, characterized with relative thick body and annulated cuticle forming collar at the anterior end. Anterior end was with three lips, excretory pore found at anterior end of body at the base of the lips, muscular esophagus was ending near the round ventriculus, gonads not developed. Ventricular appendix was narrower than broad intestinal caecum. The body characterized with broad intestine filling remainder of it. Three anal glands present. Tail with spine and sharply pointed. Total body length 12-14 (13) mm, width 0.35-0.38 (0.37) mm, head diameter 0.11-0.12 (0.11) mm. The position of nerve ring to the anterior end 0.29-0.36(0.33) mm. Deiridsposition to the anterior end 0.37-0.43(0.40) mm, esophagus length 2.12-2.20 (2.16) mm and about 15%-17% (16%) to the body length. Ventricular appendix 0.80-0.82 (0.81) mm and about 37% to esophagus length, intestinal caecum length 1.56-1.74 (1.65) mm. Intestinal caecum long to ventricular appendix long about 73%-79% (76%), the tail length 0.09-0.15 (0.12) mm and about 0.7%-1% (0.9%) to total body length (Fig. 1,2).

![Fig. 1. *Contracaecum* larva: A anterior end of nematode showing N.r. (Nerve ring), Eso (Esophagus), Ic. (Intestinal cecum), V.ap. (Ventricular appendix), scale bar= 0.8 mm, B posterior end of nematode showing An. (Anus), scale bar=0.33 mm. Camera Lucida.](image1)

![Fig. 2. *Contracaecum* larva: A anterior end of nematode showing Eso (Esophagus), 40X, B posterior end of nematode showing An. (Anus), 100X. Light microscope.](image2)

PCR analysis of representative ITS amplicons for all *Contracaecum* larvae isolated from proventriculus of *N. nycticorax* birds in Al-Sanaf marsh(Fig. 3).
Fig. 3. Electrophoresis of rDNA gene (ITS-1) for *Contracaecum* larvae at 451 bp according to DNA Ladder (1000-100 bp), lines 1-21 positive except 13 negative.

In the present study, *Contracaecum* larvae isolated from proventriculus of *N. nycticorax* birds in Al-Sanaf marsh observed in the ITS-1 gene. The sequences of ITS1 of *Contracaecum* submitted to GenBank with the accession numbers MK424799.1 and MK424795.1 and compared with the previously reported reference gene sequences in the GenBank. The first isolate with accession number MK424799.1 matched 99% of the previously reported reference gene sequences in the GenBank *C. septentrionale* with accession number AJ634784.1 *C. septentrionale* recorded for the first time in Iraq by present study. The second isolate with accession number MK424795.1 matched 99% of the previously reported reference gene sequences in the GenBank *C. microcephalum* with accession number FM177523.1.

**Discussion**

Morphological identification used to identify larvae of *Contracaecum* spp. to the genus level in Iraq. Some reports indicated presence of the larval stage of *Contracaecum* in esophagus and proventriculus of aquatic birds. In Iraq Mhaisen recorded *Contracaecum* spp. larvae from *P. carbo* and Awad *et al.* isolated *Contracaecum* spp. larvae from *Egreta alba* and *Platalea leucordia* and in Poland, Kanarek and Bohdanowicz showed that stomachs of *P. carbo* were found to contain adult *C. rudolphii* and its larvae which were identified as the third and fourth stages. The *Contracaecum* nematodes embedded in the proventriculus of infected birds causing many lesions in their anchoring sites especially when infection is high, others penetrated into the outer layers and some also noticed free or in the gills and penetrating the flesh of ingested fish. In the current study, the ITS-1 regions sequenced for the first time for *Contracaecum* larvae in Iraq, the isolated larva with accession number MK424799.1 matched 99% of the previously reported reference gene sequences in the GenBank *C. septentrionale* adult with accession number AJ634784.1 isolated previously from *Alca torda* bird (razorbill) from the Galician coasts, Spain. ITS-1 region amplified from genomic DNA samples from individual larvae and it was 436 bp in length. Molecular approaches used in the present study were useful in identifying the larvae species. Therefore, we also provide the first molecular evidence of *Contracaecum* infection in Iraq. Many studies have reported that the first (ITS-1) internal transcribed spacers of nuclear ribosomal DNA (rDNA) give genetic markers for the identification of a range of species of ascaridoids.

Phylogenetic relationships between *C. septentrionale* and *C. microcephalum* from the present study and other *Contracaecum* species as inferred by maximum likelihood obtained from ITS-1 gene. The phylogenetic tree was constructed using Unweighted Pair Group method with Arithmetic Mean (UPGMA tree) in (MEGA 6.0 version).

Adult of *C. septentrionale* nematod was isolated from *Phalocrocorax aristotelis* from Iceland and from *P. aristotelis* and *P. carbo* from the coasts of both Iceland and Norway. The morphologically described of this species based on differences at anterior end of the adult worm and in the length of spicules in
the male. This species considered as a closely related species to *Contracaecum rudolphii* in cormorants. Reports of *C. septentrionale* have been rare. Li *et al.* identify genetically *C. septentrionale* and provide support for the validity of this parasite as a separate species by using ITS-1 and ITS-2 regions of rDNA and they suggested this clear genetic differentiation need for a detailed morphological description of this parasite. The molecular identification of larval stages of *Contracaecum* spp. are very limited as Shamsi and Aghazadeh-Meshgi, Shamsi *et al.*; Jabbar *et al.*; Dezfuli *et al.*, Pekmezci and Yaridinci. Furthermore, in Iraq molecular identification of *Contracaecum* larvae in fish species have also not been studied, and there is still no correct identification of the *Contracaecum* species fish species from Iraqi waters and this is the first report in Iraq about molecular identification of *Contracaecum* larvae in fourth larval stage isolated from proventriculus of birds with ingested fishes during bird feeding. Adult *C. microcephalum* previously reported from some fish eating birds in Iraq: *Ardeapurpurea*, *Phalocrocorax pygmeus* and *Egretta grazetta* (Linnaeus, 1758) *E. grazetta*, *Ardeola ralloides*, *Ardea cinerea* and *Ixobrychus minutus*. There is no identification of *C. septentrionale* as an adult stage from fish-eating birds in Iraq, therefore the molecular identification of *C. septentrionale* larvae was recorded this species for the first time in Iraq. The alignment of the sequences between larval stages and adult of *Contracaecum* nematodes can be promising for identification of these parasites. By using molecular identification Shamsi and Aghazadeh-Meshgi reported that the *Contracaecum* larvae in Iran belong to *C. multipapillatum sensu lato*, Pekmezei and Yaridinci showed that the *Contracaecum* larvae in Turkey belong to Contracaecum overstreeti. In current study Contracaecum larvae related to two distinct species *C. septentrionale* larvae and *C. microcephalum*. The molecular diagnosis nematodes in different hosts and at any developmental stage is very important for studying their population ecology and biology, systematics and for controlling the diseases, they cause.

**Conclusion**

The analysis of the ITS-1 data for *Contracaecum* larvae supported the distinction between species of *Contracaecum* larvae.

Anthropometric with Thyroxine Hormons in Iraqi Women

Zainab Abdul Wahed Naji

Department of Biochemistry, College of Medicine, Aliraqia University, Baghdad, Iraq

Abstract

Polycystic ovarian syndrome (PCOS) is a common heterogeneous, multifactorial and chronic endocrine disorder characterized by multiple hormonal imbalances, occupied by manifestations of hyperandrogenism and many a times with hyperthyroidism. Clomiphene is a well known drug for its safety, effectiveness and relatively low cost as compared to other drugs. The aim of the present study is to evaluate the effect of clomiphene on anthropometry measurement and thyroxine hormones in Iraqi women. Seventy three infertile patients with polycystic ovary syndrome (PCOS) were enrolled in the present study. They were randomly divided into three groups. Three doses of clomiphene (50, 100 and 150mg) were given to enrolled patients (n=72). Lower concentration of clomiphene showed decreases in the body mass index and waist-hip ratio of obese and overweight individuals. Lower dose (50mg) of the clomiphene is effective while higher dose (100 and 150mg) showed non-significant increase in the serum T3 level. The present study concluded that clomiphene act effectively on the obesity and patients treated with this showed a positive effect.

Keywords: Polycystic ovarian syndrome, hyperthyroidism, thyroid hormones, T3 and T4 levels.

Introduction

Polycystic ovarian syndrome (PCOS) is a common heterogeneous, multifactorial and chronic female endocrine disorder characterized by multiple hormonal imbalances, conquered by manifestations of hyperandrogenism affecting around 7-10% of women in reproductive age. PCOS is associated with obesity and multiple ovarian cysts that lead to infertility. It has multiple clinical manifestations such as differential insulin sensitivity, abnormal steroid hormone metabolism, and adipocytokine secretion. PCOS is the widespread metabolic disorder affects women in their reproductive age and often accompanied by increased levels of free testosterone, and luteinizing hormone (LH). It is also reported to have thyroid abnormalities like hypothyroidism can cause ovulatory and menstrual dysfunction. Barber et al. reported a close correlation between adiposity and symptom severity in women with PCOS, and even modest reductions in weight generally translate into significant improvements in menstrual regularity, fertility and hyperandrogenic features.

About more than 99% of thyroid hormones (T4 and T3) are bind to the transport proteins. Remaining 1% of thyroid hormone is unbound or free and biologically active. The transporter of this hormone is Thyroxine Binding Globulin (TBG). Its serum concentration is influenced by numerous conditions which can leads to significant increase or decrease in total T4 concentration. Serum estrogens, pregnancy, hyperthyroidism, acute hepatitis levels are usually increase while androgens, corticosteroids, systemic syndrome levels decreased in response with TBG level.

Drugs like, clomiphene is a well known drug for its safety, effectiveness and relatively low cost as compared to other drugs. It is usually used to treat irregular or absent menstrual cycles which is commonly known as ‘luteal phase defect’. It increases progesterone secretion during the second half of the cycle and allow to predict the lengths of menstrual cycle. Thereby the time of intercourse or artificial insemination can be calculated.

Despite of high occurrence, the etiology of PCOS remains unknown due to the heterogeneity of clinical symptoms. Symptoms of PCOS frequently occur around puberty; however the starting point may be as early as during fetal development. The elevated level of androgen affects around 60-80% of PCOS women and can consequence in the signs such as hirsutism, acne, and...
alopecia. In PCOS, high circulating levels of androgens, estrogens, sex steroid precursors and glucuronidated androgen metabolites have been confirmed. The cause of LH hypersecretion in PCOS is possibly due to improved pituitary sensitivity to gonadotropin releasing hormone (GnRH). It appears due to the acquired impaired sensitivity of the hypothalamic pulse generator to the negative feedback of estrogen and progesterone in PCOS. Levels of follicle stimulating hormone (FSH) in PCOS is low or within the lower follicular range, and response to GnRH is relatively similar to ovulatory controls. Alteration in sex steroid production, metabolic dysfunction, and obesity might be contributed to the change in LH secretion pattern. In the present study effect of clomiphene were evaluated on anthropometry measurement and thyroid hormones in the Iraq women.

Material and Method

Enrollment of the patients: Seventy three infertile patients with polycystic ovarian syndrome (PCOS) were enrolled in the present study. Oral consent was obtained before enrollment.

Treatment of Clomiphene: The enrolled patients were randomly divided into three groups on the bases on their clomiphene treatment. The patients were given Clomiphine at various doses such as 50mg (n=21), 100mg (n=23) and 150mg (n=28).

Blood collection and its separation: The blood was collected before (pre-treatment sample) and after (post-treatment sample) treatment to check its effect. The collected samples were centrifuged at 3000rpm for 10 minutes, and serum was separated within 30 minutes from the time of blood collection. Serum was aliquots in an eppendorf tube and frozen in the deep freeze at -40°C.

Estimation of TSH, T3 and T4 from blood: Serum of all patients was subjected for the estimation of thyroid-stimulating hormone (TSH) and two thyroid hormones (T4 and T3). The estimation of TSH, T3 and T4 were carried out as per manufacturer’s instruction (VIDAS® system, Biomerieux, Italy).

Statistical Analysis: The results were represented as mean ± Stand error (n=21). The data were processed in the Microsoft excel program and graphpad prism 5 (version 5.01).

Results

Effect of Clomiphene on anthropometry: Body

mass index (BMI): Clomiphene has a positive effect on the body mass index (BMI). Lower concentration of clomiphene showed decreases in the BMI of obese and overweight individuals. However, higher concentration has reversed effect on the BMI of normal individuals. The effects clomiphene were depicted in Figure 1.

![Figure 1: Body mass index of PCOS diagnosed women before and after treatment of clomiphene.](image1)

Values are expressed as mean of enrolled patients.

Waist-hip ratio (WHR): The waist-hip ratio of enrolled women are depicted in Figure 2. Lower dose has effectively reduced waist-hip ratio.

![Figure 2:Waist-hip ratio (WHR) of PCOS diagnosed women before and after treatment of clomiphene.](image2)

Values are expressed as mean of enrolled patients.

Serum thyroid-stimulating hormone (TSH) level remains unchanged after treatment: The effect of various concentrations clomiphene on blood TSH level was depicted in the Figure 3. The clomiphene has not shown any effect on the serum TSH level.
Discussion

Thyroid disorder and PCOS are closely associated with each other. Various reports, including comparative study in normal and PCOS women are available in support with above relationship\textsuperscript{7-10}. Cases of congenital hypothyroidism, if untreated for a longer period, it may lead to change in ovarian morphology and can even be mistaken for ovarian malignancies\textsuperscript{11}.

In the past two decades, the number of PCOS patients with thyroid disorders has been increased. Sinha et al\textsuperscript{10} reported higher prevalence of goitre’s (27.5\% vs 7.5\%) and subclinical hypothyroidism (22.5\% vs 8.75\%) in PCOS patients in PCOS and normal women, respectively (case-control study, n=80). An abnormally high level of thyroid stimulating hormone (TSH) with normal level of free thyroxine (T4) and absence of frank symptoms of hypothyroidism is known as subclinical hypothyroidism is known as subclinical hypothyroidism (SH)\textsuperscript{12}. In general population, the prevalence of SH is about 4\% to 8.5\%\textsuperscript{13,14} and it is significantly higher in patients with infertility\textsuperscript{15}. The thyroid hormones increased during pregnancy can lead to an aggravation of SH in pregnant women\textsuperscript{13}. Some complications related with hypothyroidism are disturbances in menstruation, infertility, increased risk of miscarriages, obstetrical difficulties and adverse outcomes in the offsprings\textsuperscript{15}.

The granulose cells, corpus luteum and oocyte have direct effect of thyroid hormone. Therefore, increased levels of thyroid stimulating hormone (TSH) and thyrotropin releasing hormone (TRH) can cause ovulatory dysfunction, or dysfunction of corpus luteum\textsuperscript{17}. Franklyn\textsuperscript{18} reported that 11\% to 24\% of infertile women having ovulatory dysfunction or corpus luteum problems have subclinical hypothyroidism (SH). American association for clinical chemistry\textsuperscript{19} suggested that the upper limit (2.5mIU/L) of serum TSH value in population requiring careful screening to exclude thyroid disease.

In the present study, enrolled patients were classified into normal, overweight and obese depends on their BMI and WHR. Several studies reported the direct correlation of PCOS and BMI/WHR\textsuperscript{1}. Koppalli et al.\textsuperscript{1} reported BMI and WHR were higher in the PCOS patients. The serum levels of sex hormone binding globulin (SHBG), vitamin D, calcium, dehydroepiandrosterone sulphate (DHEAS), follicle stimulating hormone (FSH), estradiol and luteinizing hormone (LH) levels were also altered in the PCOS patients.
Conclusion

The study concluded that the lower dose of clomiphene (50mg) decreased serum thyroid-stimulating hormone, T3 and T4 level as compared to the higher dose (150mg). Clomiphene act effectively on the obesity and patients treated with this showed a positive effect.

Ethical Statement: The study design was approved from the Institutional ethical committee, College of medicine, Aliraqia University, Baghdad, Iraq. Oral consent was obtained before enrollment.

Isolation and Identification of Pathogenic Bacterial Species from Refrigerators in Basrah City, South of Iraq

Zainab Alag Hassan¹, Rashid Rahim Hateet², Abdulameer Abdullah Al-Mussawi³

¹Lecturer/College of Nursing, University of Basrah, Basrah, ²Assistant Professor/College of Nursing, University of Mesan, Mesan, ³Professor/College of Nursing, University of Basrah, Basrah, Iraq

Abstract

Objective: To isolate and identify bacterial species from refrigerators in Basrah city.

Method: A total of 37 household refrigerators were sampled in Basrah city. With the consent of householders swabs moistened soaked with Buffered Peptone Water were collected from the base, shelves and sides of the refrigerator and were transported to laboratory under chilled conditions (4°C ± 1.0). Each sample collected was plated out on many culture media.

Results: *Citrobacter freundii* was the most frequently isolated pathogen in this study, being recovered from 31.57% of refrigerators. *Listeria monocytogenes* and *Pseudomonas spp.* were recovered from 17.55% of refrigerator surfaces, *Salmonella spp.* from 14.03%, *Escherichia coli* from 10.63% and *Listeria innocua* from 8.77%.

Conclusions: This study concludes that most of the refrigerators under study were contaminated with some bacterial species and some of these are pathogenic and lead to diseases such as *Listeria* and *Salmonella*. Continuous cleaning and using disinfectant agents reduces bacterial contamination.

Keywords: Isolation, Bacteria, Contamination, Basrah.

Introduction

Food-borne diseases which caused by ingesting contaminated foodstuffs are widespread and growing public health problem. The global incidence of food-borne disease is difficult to estimate, but it has been reported that in 2005 alone, 1.8 million people died from diarrhoeic diseases¹. Stored foods in domestic refrigerators may be contaminated when introduce contaminated foods, leaking packages, hands, and surfaces which may attach to the internal surface of the refrigerator leading to indirect longer term contamination during activities of subsequent food preparation². Most studies focused on the contamination of surfaces in kitchens and rest rooms by bacteria³,⁴. Some pathogenic bacteria can survive on the surfaces in these environments for some time, and contaminate food leading to illness.

Because refrigerators are used to store food, Microbial contaminations of refrigerators have been studied⁵,⁶. Moisture and nutrients in refrigerators provide favorable growth conditions for contaminating bacteria⁷.

Refrigeration is used to control the rate of certain chemical and enzymatic reactions and the rate of growth of food microorganisms⁸. The refrigerator reduces the rate of spoilage by reducing the reproduction rate of bacteria⁸. When there is contamination with microbes, this can cause food spoilage (change in characteristics of food rendering it unacceptable or unsafe for consumption) and food borne diseases (defined by WHO, as any disease of an infectious or toxin nature caused by or thought to be caused by the consumption of food or water). In the light of the above, the present study aimed to isolation and identification of bacterial species from refrigerators in Basrah city.

Materials and Method

Sampling procedure: A total of 37 household refrigerators were sampled in Basrah city. With the
consent of householders swabs moistened soaked with Buffered Peptone Water (BPW, Oxoid) were collected from the base, shelves and sides of the refrigerator and were transported to the laboratory under chilled conditions (4°C ± 1.0°C). Each sample collected was plated out on the following commercially available culture media in the laboratory listed in Table 1.

Study protocol (questionnaire distribution):

Thirty seven households participated in the study that randomly selected were participated in the evaluation of their knowledge in relation to the use of refrigerator by giving an Oluwafemi et al. with modifying questionnaires consisting of questions covering social demographics, refrigeration practices, refrigerator maintenance practices, etc. to each householder.

**Results**

*Citrobacter freundii* was the most frequently isolated pathogen in this study, being recovered from 31.57% of refrigerators. *Listeriamonocytogenes* and *Pseudomonas spp.* were recovered from 17.55% of refrigerator surfaces, *Salmonella spp.* from 14.03%. *Escherichia coli* from 10.63% and *Listeria innocua* from 8.77% (Table 2). The use of chromo agar media provide easy and rapid diagnosis of bacteria as shown in Figure 1.

The social demographic result shows, refrigerator maintenance practices and food safety knowledge of the householders participated in the study. Educational levels of respondents ranging from primary school to doctorate degree. 67.6% of respondents did not clean vegetables and fruits before keeping in refrigerators. Another factor that could have affected the microbial quality of refrigerators was the cleaning regimes and the type of cleaning. Most respondents reported varying degrees of cleaning regimes. 45% of respondents reported cleaning their refrigerators weekly while only 8.1% of respondents reported cleaning their refrigerators daily. 18.9% of householders only used disinfectants in cleaning their refrigerators while most of them (43.2%) used water and soap. Many of respondents (72.9%) have knowledge about food borne diseases from different sources.

Fifteen refrigerators (40.5%) provided no bacterial growth, the owners of most of them cleaned them weekly and often did not store leftovers for more than 24 hours (table 3).
As shown in Table 4, about 45.8% of samples collected from refrigerators from urban areas provided no bacterial growth compared with 38.5% samples from rural areas.

**Discussion**

*Citrobacterfreundii* was the most frequently isolated bacteria in this study. *C. freundii* is a common component of the gut microbiome of healthy humans. While most strains are beneficial, some rare strains of *C. freundii* have been associated with opportunistic nosocomial infections of the respiratory tract, urinary tract, blood, and many other normally sterile sites in immunocompromised patients. *Listeria monocytogenes* and *Pseudomonas spp.* were the most frequently pathogens in this study and were recovered from 17.55% of the refrigerators examined. *Listeria monocytogenes* is the species of pathogenic bacteria that cause listeriosis infection. It can grow and reproduce inside the host’s cells and is one of the most virulent foodborne pathogens, with 20 to 30% of food borne listeriosis infections in high-risk individuals may be fatal. *Pseudomonas spp.* are found widely in the environment, such as in soil, water, and plants. They usually do not cause infections in healthy people. Infectious species include *P. aeruginosa*, *P. oryzihabitans*, and *P. plecoglossicida*. *P. aeruginosa* flourishes in hospital environments. It is the second-most common infection in hospitalized patients (nosocomial infections).

*E. coli* was isolated from 10.63% of refrigerators in this study widely. It is accepted indicator of fecal contamination suggesting that the refrigerator internal surfaces are frequently contaminated by the import of contaminated raw foods or by poor personal hygiene.

*Salmonella* sp. was recovered from 14.03% refrigerators. It is a frequent contaminant of many retail foods possesses public health challenges in terms of potential cross contamination to food and food preparation surfaces during routine food preparation. *Salmonella* sp. are equally easily spread through the domestic environment where they can persist for up to four days. Surface associated *Salmonella* sp. still because a significant cross contamination risk means this pathogen can multiply under condition of mild temperature abuse in cross contaminated foods. *Salmonella* sp. was found to be easily spread throughout the domestic environment. *E. coli* was identified in this study, which is relatively rare occurrence of the low infectious dose pathogens in the human food chain and its ability to form viable non-culturale forms.

From 37 refrigerators (45.8%) of them were from urban areas showed no bacterial growth compared with those from rural areas (38.5%). Householders from urban areas may be more interested in cleaning and maintenance of refrigerators and preparing healthy food according to their knowledge about foodborne diseases. The results showed that 67.6% of respondents did not clean vegetables and fruits before keeping in refrigerators may because of the common belief that store them without washing makes them resistant to rot for longer time. That action leads to spread of bacteria in refrigerators. The use of chromagar media give rapid detection to differentiate between the bacterial colonies by color and morphology characteristics.

It is impossible to completely exclude food pathogens from the kitchens; however their spread, growth and survival can be controlled with correct food storage and preparation of practices and regular cleaning and disinfection of food contact sites. This study concludes that most of the refrigerators under study were contaminated with some bacterial species and some of these are pathogenic and lead to diseases such as *Listeria* and *Salmonella*. Continuous cleaning and using disinfectant agents reduces bacterial contamination.

**Ethical Clearance:** Approval to conduct the study was obtained from the dean of college of Nursing, University of Basrah.

Motivation for Choosing Medicine as a Career, among Students of Baghdad Medical College

Zuhair A. Al-Johar¹, Aya Ahmed Ridha², Donia Saad Zidan², Dalya Mahir Salih²

¹Lecturer and specialist of Neurology [FIBMS(Neurology)], Department of Medicine, College of Medicine, University of Baghdad, Baghdad, Iraq; Orcid, ²Students of College of Medicine/University of Baghdad

Abstract

Purpose: To determine the type of motivation for medicine, its gender-difference, and the relative impact of motivational factors.

Method: An observational cross sectional survey study where 182 students were taken from College of Medicine/University of Baghdad “CM/UB” from both genders and all six grades, from the 10th of April, 2017 to the 1st of June, 2017. Self-administered structured questionnaire surveys were given, which included specific motivational factors and participants were asked to rank them according to priority in motivating them.

Results: A total of 180 students responded to the survey; of those: for first priority motivation: 96 (53%) chose a controlled factor, while 84 (47%) chose an autonomous factor of all 82 males: 51 (62%) chose a controlled factor, while 31 (38%) chose an autonomous factor of all 98 females: 45 (46%) chose a controlled factor, while 53 (54%) chose an autonomous factor. High school scores, helping others, passion in medicine, and family pressure had the highest motivational influence at overall and first priority levels.

Conclusion: Controlled motivation was found to be the main type of motivation, with males being influenced by it more than females. High school scores, helping others, passion in medicine, and family pressure had the highest motivational influence.

Keywords: Motivation, Medicine, students.

Introduction

Definitions: Motivation can be defined as one’s direction of behavior or the cause of wanting to repeat a behavior or refrain from it. Motivation is divided into: Intrinsic motivation and Extrinsic. Self-determination theory “SDT” divides motivation into: Autonomous motivation “AM” which includes intrinsic motivation or extrinsic motivation that is identified by the individual with an activity’s value and a feel of alignment with their sense of self; and Controlled motivation “CM” which is either due to external rewards and punishment or one that arises from only partially internalized activities and values such as seeking approval, avoiding shame, and protecting the ego.

Motivation for Medicine: There are indicators of change in the reasons to study medicine over time and it is felt that care about others and wanting to help people as part of their job is the reason why many students are choosing this career. Around two-thirds of the students in the study reported they were intrinsically motivated in applying for medical school. On the other hand family pressure is one of the reasons to study medicine, mainly being in third world countries.

Most studies prefer autonomous motivation to controlled motivation for medicine as regards its correlation with better learning and outcomes at future career.
In Iraq, the only criterion for admission to medical colleges is high secondary school scores\textsuperscript{11}. Motivational factors in Iraqi students included: interest in helping people (42.8\%), family pressure (45.4\%), passion in medicine or childhood dream (36.2\%), high average score of sixth secondary school grade (28.3\%), prestigious job (32.2\%), profiting profession (13.2\%), and presence doctors in the family (9.2\%). So the higher percentage (61.8\%) was “personal preference” which is autonomous, followed by “My parents vision and choice” (45.4\%) which is controlled motivation\textsuperscript{12}.

Knowledge of the motivational factors for studying medicine might prove helpful in student selection and support\textsuperscript{13}.

The effect of Gender: despite the increment in number of females in medicine, still there are issues of gender that continue to have a substantial impact on their medical education\textsuperscript{14}. Female selection for medicine as a career is increasingly noticed in the past few years\textsuperscript{15}. In Iraq females constituted around 69.1\% of medical students in recent years\textsuperscript{12}.

Both genders have been shown to have common factors for choosing careers, men place greater emphasis on manual dexterity skills and financial advantages, while women place greater emphasis on people education and type of people encountered\textsuperscript{16}. Primary motivational factors in girls were patient care, interest in science, career opportunity and personal skills, while in boys they were patient care, interest in science, status-security, self-employment, however no statistically significant differences were found between both genders. But there was significance in getting encouragement from family being more by girls\textsuperscript{17}.

Objectives: The principle aims of our research are to elucidate the:

1. Type of motivation (autonomous\textsuperscript{}\textbackslash{}controlled), and its relation to gender.
2. Motivational impact of specific factors

Subjects and Method

Study design: Observational cross sectional analysis.

Location: CM\textbackslash{}UB

Inclusion criteria: All students of CM\textbackslash{}UB from first to sixth year.

Study sample: 182 student surveys collected from the study population from the 10th of April, 2017 to the 1st of June, 2017.

Sampling method: Convenience sampling.

Data collection: We gave the participants printed papers containing a structured self-administered questionnaire survey form. We divided the survey papers equally between us, the survey questionnaire were offered to students after taking permission and explaining to them the aim of the study. The study was conducted in accordance with the latest version of the principles of the Declaration of Helsinki (2013). We explained to all participants the purposes of the study, its confidential nature and they were free not to answer. The questionnaire gathered information about Age, Gender, Grade, and factors of:

- Family/friends pressure
- High-school score
- Prestige
- Improving socioeconomic status (Profitable)
- Intellectual challenge (need to be number one in everything)
- Passion in medicine
- Interest in helping people
- Presence of doctors in the family or among friends
- Others as mentioned by the students

We requested from all participants to order their choice of motivational factors according to priority in motivating them from the highest priority to the lowest.

Study variables: Those are divided into two categories, according to SDT\textsuperscript{4,5}.

1. Autonomous Motivation (AM): those are the last 3 specific factors present in the above list, where the first two are intrinsic and the third is extrinsic, and all other factors that the students chose that are deemed autonomous according to the lines presented in the introduction of this research.

2. Controlled Motivation (CM): those are the first five factors present in the above list.

We only studied two aspects of motivation: first priority motivation, were the student’s type of motivation was decided from the student’s choice of the factor at that level and the categorization of autonomous and controlled motivation. The second aspect is the overall motivation per factor which is calculated without respect to priority, and it is the total number of students who chose that factor at any priority level.

Statistical analysis: We enrolled the data obtained from the survey forms, sorted and tabulated them on a
personal computer, and did the relevant analysis using SPSS Statistics 17.0 (SPSS Inc. Chicago, Illinois, US). We expressed data using descriptive statistics of proportions, standard deviations “SD” and 95% confidence intervals “CI”; We tested significance of results using the one sample proportion z-test against chance probably of 50%, Chi-Square test when all expected values were higher or equal to 5, and Fisher’s exact test when some expected values were lower than 5.

Finding

General characteristics: We offered the survey to a total of 182 medical students out of all students of Baghdad medical college, only two students didn’t agree to take the survey (rejected), and all of rest 180 students have fully participated in the survey, so the response rate is 99%. The Average age of the participants is 21 (Range: 18 - 24 years). The gender distribution is: female 98 (54.4%) and male 82 (45.6%), the female to male ratio is 1.195. The number of students who participated in our survey from each grade (year of study) is: First grade 26 (14.4%), second grade 30 (16.6%), third grade 37 (20.5%), fourth grade 31 (17.2%), fifth grade 29 (16.1%) and sixth grade 27 (15%).

Overall motivation: Two major trends regarding overall motivational factors, with the higher reported group being: high school score, helping others, family pressure, and passion in medicine; and the rest of the factors constituting the lower reported group. Figure (1).

![The impact of motivational factors in the total sample](image)

Figure 1 The percentages of motivational factors in the overall sample of 180 students from College of Medicine\University of Baghdad at year 2017

Table 1 depicts the descriptive statistics of the motivational factors(irrespective of priority) per gender and the statistical significance of gender-wise differences between them. Gender-wise significant differences were observed regarding factors: helping others, presence of doctor in the family, socio-economic (profitable), and prestige. The highest reported factor in the whole sample was high school score 84 (47%), and the lowest being prestige 20 (11%).

**First priority motivation:** Of all 180 students: for first priority motivation: 96 (53%) (SD 3.7%, 95% CI [46% - 60%]) chose a controlled factor, while 84 (47%) (SD 3.7%, 95% CI [40% - 54%]) chose an autonomous factor, which is not statistically significant (z-test statistic=0.81, p=0.42) against 50% chance probability of all 82 males 51 (62%) (SD 5.4%, 95% CI [51%-73%]) chose controlled factors, while 31 (38%) (SD 5.4%, 95% CI [27%-49%]) chose autonomous factors, which is found to be a statistically significant result compared to a chance determined mean of 50% (z= 2.173, p=0.03) of all 98 females 45 (46%) (SD 5%, 95% CI [35.88% to 56.37%]) chose controlled factors, while 53 (54%) (SD 5%, 95% CI [43.63% to 64.12%]) chose autonomous factors, which is not statistically significant (z=0.792, p=0.43) against chance. However the difference in type of motivation per gender at first priority level was found to be significant ($\chi^2$=4.7522, p=0.03). (Figure 2)

**Dissuasion**

There was no significant difference in the proportion of all students who has controlled motivation from those who were autonomously motivated at first priority level (53% CM; 47% AM). As for overall motivation per factor: High secondary school score ranked even higher than the will to help others (84(47%) versus 73(41%)), while family pressure came third 71(39%) just slightly lower than helping others. These findings are incompatible with results of most recent studies.6-8. Our results even comes in conflict with results of a recent study done in the same college of ours, where autonomous motivation was found to be the main motivation (61.8%)12. The differences with studies conducted in other countries might signal cultural or social differences. The differences with the local study might be due having higher percentage of females in their study.

Focusing on gender differences is gaining an increasing interest when studying medical vocation, as increasing numbers of women are entering medical schools worldwide18. In the present study females constituted more than 50%, and this even reached up to 69 % in other local studies12.

As regards gender differences, our study showed that: At first priority: 51(62%) of the entire 82 male sample chose controlled factors while 31(38%) chose autonomous factors (p<0.05) . On the other hand: of 98 females, those who chose controlled factors were 45(46%), while 53(54%) chose autonomous factors as first priority with p>0.05. However statistically significant difference in type of first priority motivation per gender was found in our study with females being more autonomously motivated than males and the latter having more controlled motivation. This is consistent with results from earlier studies were males had higher CM and lower AM than females10. Other studies revealed that male students are more motivated by prestige status and income while female students have a care oriented motive17,19-21, and our study agrees with all of these results.

For individual factors, there is agreement with a local study12 regarding factors: interested in helping people, passion in medicine, family pressure, and socio-economic status; while it conflicts with it regarding factors of: prestige, high school score and presence of doctors in the family. This variation in type of motivation between the two studies despite having near sample sizes might be due to the difference in inclusion criteria where our study included students from all grades of CM/UB, while their study only focused on first year students12. Also their study had higher percentage of females than ours12. The difference in presence of doctors in the family might be explained by these sampling differences, since it can naturally vary from a year to another, however the difference in prestige and high school score impact has no clear explanation.

**Conclusion**

1 Males have more controlled motivation than females.
High school scores, helping others, family pressure, and passion in medicine had the highest motivational influence.

Thyroid Dysfunction and Abnormal Uterine Bleeding

Tara Hasan Al-Bajalan¹, Srwa Ismael Khalid¹

¹Department of Obstetrics and Gynecology, Maternity Teaching Hospital, Erbil, Iraq

Abstract

Objective: Measure the prevalence of thyroid dysfunction in women presented with abnormal uterine bleeding in Erbil city.

Method: A case control study conducted in the outpatient Clinic at Maternity Teaching Hospital in Erbil city from 1st of September, 2017 to 30th of June, 2018 on 100 women (50 women with abnormal uterine bleeding and 50 women with a normal cycle selected as control cases. The general and menstrual history in addition to investigations and thyroid function test of both study groups were assessed.

Results: There was a significant association between high thyroid stimulating hormone level and women with abnormal uterine bleeding (p=0.002). Women with abnormal uterine bleeding were significantly associated with low T4 level (p=0.04). A significant association was observed between women with abnormal uterine bleeding and hypothyroidism (p=0.003).

Conclusions: The thyroid dysfunction is common cause of abnormal uterine bleeding among women at reproductive age.

Keywords: Abnormal uterine bleeding, Thyroid dysfunction, Reproductive age women, case control study, maternal health.

Introduction

The abnormal uterine bleeding (AUB) is defined as a symptom that represent the frequent complaint of women attending Gynecology clinics. The AUB is affecting women in pre- and postmenopausal age periods¹. Clinically, it presented in many forms like menorrhagia, metrorrhagia, menometrorrhagia, polymenorrhea, polymenorrhagia and oligomenorrhea². New classification system was developed by International Federation of Gynecology and Obstetrics used to categorize the causes of AUB in reproductive age and based on acronym (polyps, adenomyosis, leiomyoma, malignancy and hyperplasia–coagulopathy, ovulatory disorders, iatrogenic, not classified)³. The causes of AUB might be related to hormonal balance disturbances or it might be clinical presentation for benign or malignant lesions of female genital tract in reproductive age group woman. The dysfunctional uterine bleeding (DUB) is adopted in the absence of abnormal pathological changes³. AUB in most of Iraqi women younger than 60 years age is found to be predominantly dysfunctional in origin. However, it is related to abnormal pathology in others⁴,⁵.

The thyroid dysfunctions are common all over the world and the thyroid diseases are 10 times more prevalent among women than men⁶. In Iraq, non-toxic goiter presents in about one third of women and the toxic goiter in about 25% of women; while the hypothyroidism is detected in about 14.5% of women⁷. The thyroid dysfunction in women is related to abnormal menstrual cycle⁸. Thyroid hormones are responsible in initiation of many physiological processes in females like pubertal growth & development, menarche, menstrual cycles, fertility and menopause⁹.

The mechanism by which the thyroid disorders is associated with AUB may be explained by altering thyroid stimulating hormone (TSH) response, increasing prolactin levels, altering luteinizing hormone (LH) response, affecting peripheral conversion of androgens
to estrogens, altering sex hormone binding globulin (SHBG) and affecting coagulation pathways in addition to effect on lipid profile\textsuperscript{10}.

The hypothyroidism is a frequent cause of multiple disorders in women at reproductive age ranged from sexual dysfunction, menstrual abnormalities and infertility\textsuperscript{11}. Disturbed cycles and abnormal blood flow are the first menstrual problems for women with hypothyroidism\textsuperscript{6, 11}. The occult menorrhagia is an earlier presentation for women with subclinical hypothyroidism\textsuperscript{12}. The menstrual irregularity was the presenting symptom of 24% of Iraqi women diagnosed with hypothyroidism\textsuperscript{13}.

For hyperthyroidism, it delays the onset of menses if occurs before puberty\textsuperscript{6}, while in reproductive age group, it is related to oligomenorrhea and amenorrhea\textsuperscript{14}. In Erbil, the women have four times risk in developing hyperthyroidism than men\textsuperscript{15}. Menstrual disturbances in women with thyroid dysfunction are sometimes the first symptoms which help in diagnosis, however, the subclinical thyroid cases (hyper- and hypothyroidism), might be neglected for many years\textsuperscript{6}.

There is evolutionary increase in the number of women attending with AUB to medical clinics in our country\textsuperscript{4}. The rationale of this study which aimed to measure the prevalence of thyroid dysfunction in women that presented with abnormal uterine bleeding in Erbil city.

\textbf{Method}

This study is a case control study conducted in the outpatient Clinic at Maternity Teaching Hospital in Erbil city from 1\textsuperscript{st} of September, 2017 to 30\textsuperscript{th} of June, 2018 (10 month). Ethical approval of the study was taken from Ethical Committee of Kurdistan Board of Medical Specialties and administration of the Maternity hospital. Confidentiality was taken in consideration and written consent was taken before enrolling women in the study. We recruited all the women that presented with abnormal uterine bleeding (AUB) to the clinic. The inclusion criteria were women in reproductive age group (18-42 years) with clinical presentation of AUB. The exclusion criteria were pregnancy related bleeding, bleeding disorders, use of intrauterine contraceptive device. A convenient sample of 50 women with AUB was selected after eligibility to inclusion and exclusion criteria. Another sample of 50 women with normal cycle selected as control cases.

The data was collected by researcher through direct interview with the selected women and completed prepared questionnaire. The questionnaire was designed by the supervisor and researcher. It included the socio-demographic characteristics of the participants (age, occupation and marital status), parity history, body mass index, smoking history, contraception history, drugs history (anti-coagulants and anti-thyroid), LMP frequency, menstrual bleeding patterns, post coital bleeding, inter-menstrual bleeding, thyroid stimulating hormone level, triiodothyronine level, thyroxin level.

After taking full history and examination, the eligible women were referred to Laboratory and Radiology department of Erbil Maternity Teaching Hospital to complete the investigations. The thyroid function tests were carried out by the Mini Vidas ELFA (enzyme linked fluorescent assay) method and immunoradiometric assay (IRMA). The normal limit values of TSH, T3 and T4 were 0.4-5 \(\mu\)U/ml, 3.5-6.5 pmol/L and 8.5-15.2 pmol/L, respectively.

All women’s data entered using computerized statistical software; Statistical Package for Social Sciences (SPSS). Descriptive statistics presented as (mean ± standard deviation) and frequencies as percentages. Multiple contingency tables conducted and appropriate statistical tests performed. In all statistical analysis, level of significance (p value) set at \(\leq 0.05\) and the result presented as tables and/or graphs.

Discussion

Abnormal uterine bleeding is accompanied by low quality of life attributed to treatment efforts of bleeding and outcomes of high blood loss like fatigability and anemia. The endocrine disturbances play a major role in pathogenesis of abnormal uterine bleeding. In our study the most common AUB was oligomenorrhea (23%) followed by menorrhagia (21%) followed by inter menstrual bleeding (5%). These findings are consistent with reports of Fraser et al study in USA which included the oligomenorrhea and menorrhagia within the definition of abnormal uterine bleeding. Deshmukh et al and Byna et al reported the menorrhagia as the most common type of AUB. The intermenstrual bleeding in our study was significantly associated with AUB women (p=0.02). Similarly, Mohan et al documented that intermenstrual bleeding is a frequent presentation of abnormal uterine bleeding. Our study revealed predominance of contraception history among women with AUB (p=0.001). Previous American study documented that hormonal contraception is the major cause of AUB among women in reproductive age period.

This study revealed a significantly higher level of thyroid stimulating hormone among women with AUB in comparison to controls (p=0.002). This finding coincides with results of Attia et al study in Egypt which found a significant difference in TSH between women with AUB and controls. Our study also showed a significant association between low T4 hormone level and women with AUB (p=0.04). This finding is in agreement with results of large cohort study carried out in USA by Kang et al which stated that low T4 hormone level was significantly related to AUB. Abnormal thyroid hormones levels contributed to disturbances in ovulatory hormones and predisposing to irregular bleeding.

Our study showed that hypothyroidism constitutes 22% of women with AUB and hyperthyroidism did present in 6% of them. These findings are higher than results of previous Iraqi study conducted by Al-Hakeim which found that among women with menstrual disturbances, the hypothyroidism present in 16.1% of them and hyperthyroidism was present in 3.4% of them. This difference in thyroid dysfunction between two studies might be due to geographical variation and high prevalence of thyroid disorders in Kurdistan. Our study finding regarding hypothyroidism is also higher than that of Ajmani study in India 5 of 14% among women with menstrual disorders. Current study showed a significant association between women with AUB and hypothyroidism (p=0.003). This finding is similar to results of many previous studies. Whitaker et al documented the hypothyroidism is one of the common diseases that must be assessed among women with abnormal uterine bleeding. The prevalence of hypothyroidism is high in Iraq country and specifically in Kurdistan region. The mechanism by which the hypothyroidism can affect the menstrual cycle is not fully understood. However, some authors attributed this relationship to irregular or no ovulation that decreases the luteinizing hormone and elevating the estrogen leading to menstrual bleeding.

Conclusions

The thyroid dysfunction is common cause of abnormal uterine bleeding among reproductive age
women. The oligomenorrhea and menorrhagia are the prevalent bleeding types. Thyroid hormones assessment should be taken in consideration in assessment of women with abnormal uterine bleeding.

Conflict of Interest: None

Ethical Clearance: Informed written consent was obtained from all the participants in the study, and the study and all its procedure were done in accordance with the Helsinki Declaration of 1975, as revised in 2000. The study was approved by the Kurdistan Board of Medical Specialties and administration of the Maternity hospital.

Source of Funding: The study supported by authors only.

Abstract

Background: Helicobacter Pylori causes gastrointestinal tract infection as well as Extra-gastric disorders with increased infection rates in developing countries. It was recently observed that these bacteria may increase their prevalence in patients with diabetes mellitus type 2.

Aims: Therefore, the present study aimed to find out the prevalence H. pylori in DMT1 in children, and its association with C-peptide and HbA1c.

Patients and Method: A total of (204) samples 91 male (44.6%) and 113 female (55.4%) were collected form type 1 diabetic children with age range (1-15) years from the Specialist Center for Endocrinology and Diabetes, Ibn Al-Baladi Hospital for Children and Women. Ethical consent and case history were obtained from parents according predesigned questionnaire. Chromatographic immunoassay rapid test was used to detect H. pylori infection seropositivity and the immunoassay analyzer cobas e411 was used for HbA1c and C-peptide.

Results: H. pylori seropositivity 61(30%) cases out from total 204 type 1 diabetic case. The C-peptide results showed significant differences between H. pylori positive and negative groups (p=0.023). Significant differences were found among the H. pylori positive, negative type 1 diabetic cases and apparently healthy in both HbA1c and C-peptide (p ≤0.001). in addition, significant positive relationship between the H. pylori infection and C-peptide (Pearson correlation= 0.663 p≤0.001).

Conclusion: This study concluded that there is association between H. pylori infection and C-peptide in type 1 diabetic children.

Keywords: Helicobacter pylori, Type 1 diabetes mellitus, Children, C-peptide and HbA1c.

Introduction

Helicobacter Pylori (H. Pylori) is one of the most remarkable pathogens responsible for infection in the gastrointestinal tract (GIT). Currently, in the world it is the most prevalent chronic infections. H. pylori is a Gram-negative, spiral-shaped pathogen that colonizes the epithelium of stomach specifically and causes peptic ulcer, chronic gastritis or other intestinal and extraintestinal illness. Affected population by H. pylori infection reach ~50% globally and it is recognized as the major acquired factor in the pathogenesis of chronic enteral gastritis, chronic atrophic gastritis, gastric cancer, and peptic ulcer disease. Extra-gastric disorder such as cardiovascular diseases, metabolic syndrome, hematologic, neurological, allergic, ocular, dermatological, hepatobiliary diseases, Chronic prostatitis, benign prostatic hyperplasia and prostate cancer were linked to H. pylori infection. Recent reports of H. pylori infection have been linked to diabetes, especially...
type 2 diabetes mellitus\(^{(9)}\). Diabetes mellitus Type 1 (DMT1), is the most common in children and teenagers\(^{(10)}\), is developed due to an auto-immune response\(^{(11)}\).

Current study aimed to find out the prevalence \textit{H. pylori} in DMT1 in children, and its association with C-peptide and HbA1c.

**Materials and Method**

A cross-sectional study was conducted to achieve the objectives. The study samples were taken from the Specialist Center for Endocrinology and Diabetes, Ibn Al-Baladi Hospital for Children and Women in the Rusafa district of Baghdad from 31\(^{st}\) December 2018 to 15\(^{th}\) February 2019. The study included 204 cases (91 male (44.6%) and 113 female (55.4%), under supervision of specialist physicians, control group include 15 apparently healthy children. Those for age range between 1-15 years old for both genders. Any patient on antibiotics and/or \textit{H. pylori} therapy were excluded. Ethical consent and information were obtained from parents according to an predesigned questionnaire which include (name, age, gender, clinical information, weight, height, BMI, number of months since the diagnosis of DMT1).

Blood and serum samples were taken from each child to perform HbA1c (blood), C-peptide and \textit{H. pylori} rapid test (serum). For \textit{H. pylori} rapid test SPECTRUM (REF: 1180001, Bioscience) was used. The positive results categorized into weak, moderate and strong reactions according to time required for band development (10-15, 3-10 and <3 minutes respectively). On other hand, cobas e411 (REF: 03184897, Roche) was used for C-peptide and HbA1c. All procedure carried out according to manufacture instructions.

The collected data was analyzed by computer using Statistical Package for Social Sciences (SPSS) version 23. P value of < 0.05 indicates significant.

**Results**

Rapid test for \textit{H. pylori} detection gave 61 (30\%) positive cases out from 204 tested DMT1 patient’s samples, from the total 61 positive results, 30 (49\%) cases gave strong reaction, while only 14 (23\%) cases were moderate and the rest 17 (28\%) were weak reaction.

Statistical analysis with independent samples T-test for means of HbA1c and C-peptide to find out the differences between \textit{H. pylori} positive (Hp+) and negative (Hp-) DMT1 patients groups showed that there were no significant differences (p=0.340) for HbA1c results. In contrast, the C-peptide results showed significant differences between two groups (p=0.046) with higher levels in \textit{H. pylori} positive type 1 diabetic cases (See table 1).

Furthermore, to find the differences among the \textit{H. pylori} positive, negative and apparently healthy (non-diabetic) groups ANOVA test was used. The results showed that there were very significant differences among means of the three groups in both HbA1c and C-peptide (p ≤0.001) as shown in table 2.

Additionally, investigation of the association between *H. pylori* infection with HbA1c and C-peptide using Pearson correlation had shown that there was very significant negative relationship (Pearson correlation= -0.429 p≤0.001) between *H. pylori* infection and HbA1c. On other hand, there was strong significant positive relationship between the infection and C-peptide (Pearson correlation= 0.663 p≤0.001). eventually, there was very significant negative relationship (Pearson correlation= -0.527 p≤0.001) between HbA1c and C-peptide (See Table 3).

**Discussion**

Large number of local and international studies had reported different percentage of *H. pylori* prevalence among different populations. Locally, Abdulla and Muhannad(12) study showed that there was 12.53% of *H. pylori* positive cases in DMT2 patients, As well as in the study of Obaid(13) prevalence rate 40%, and Jumaa and Strak(14) the percentage was 43%. Moreover, infection rate reported by international studies were higher such as the results of Abu Jabal(15) 70%, and Reshma and Kamal(16) 71.4%. All the previously mentioned studies were conducted on DMT2 patients. Although, our result of 30% come in concordance with the local studies which are relatively consider high percentage. Since the infection route of *H. pylori* is fecal-orally(17) and the local habit of chewing the food before give it to the child, such high percentage is reasonable.

Approximately half of the positive cases (49%) show strong reaction this indicates that those patients are either have active or recent infection this result higher than Salloom(18) and Alzahrani (40%) studies of DMT2 patients. The differences in the study design and the type of DM could be the reasons after the results dissimilarity.

The result of the non-significant differences of *H. pylori* positive and negative with HbA1c is in agreement with those of Yu Chen(20) which indicated that there was no association between *H. pylori* seropositivity with HbA1c levels, such results might be rational because the child’s dietary habits implicated in the glycosylated hemoglobin levels(21). On the contrary, The current study result is inconsistent with the results of Robert(21) and Fukuda et al.(22) studies in which they found that the presence of *H. pylori* bacteria was consistently associated with elevated levels of HbA1c.

Our findings of significant differences in C-Peptide means between *H. pylori* positive and negative in DMT1 children can be explain that *H.pylori* had immunomodulatory properties take place via several molecules(23) which can affect the auto-immune response against the β-cell.

This study identifies significant differences between the means of the C- peptide and HbA1c, among *H. pylori* +, *H. pylori* - and non-diabetic groups, which is supported by the above mentioned work(16,18,22) when a comparison is conducted with non-diabetic individuals.

If we can say fortunately, the current study with such design is conducted for the first time but the insufficient data and varied studies characteristics make the comparison, between our findings with other local and international research results, more difficult to carried out. Our finding of the association between *H. pylori* infection andC-peptide come inconsistently with Lu et al., 2010 and Zhou et al., 2012(24,25) studies, although, these studies design and settings could be the cause of the disagreement.

**Conclusion**

The most important new data in the present study is the documentation of the association of the *H. pylori* with C-peptide. In addition to the high prevalence of infection in type 1 diabetic children.

**Conflict of Interest:** We are declare that there is no any conflicts of interest, and this study has received no financial aid for any part of the work.

Abstract

Congenital heart defects are one of the leading causes of death among children. Congenital heart defects in children are formed in the process of intrauterine development under the influence of various adverse factors. Treatment of congenital heart defects is always surgical. Physical rehabilitation is obligatory for such children and is always applied after surgical treatment. It ensures the development of the heart muscle and the adaptation of the child to physical exertion. The main types of physical rehabilitation in children with congenital heart defects are physiotherapy exercises with elements of recreational aerobics, therapeutic massage, and physiotherapy. Their appointment is always carried out individually.

Keywords: Heart defects, childhood, rehabilitation, health, blood vessels.

Introduction

Congenital heart defects are a very large and diverse group of diseases of the heart and large vessels, accompanied by changes in blood flow, heart overload and insufficiency1. The incidence of congenital heart defects is high and, according to various authors, ranges from 0.8 to 1.2% among all newborns2. Congenital heart defects make up 10-30% of all congenital anomalies.

Many types of congenital heart defects are found not only in isolation, but also in various combinations with each other, which significantly aggravates the defect3,4. In about a third of cases, heart abnormalities are combined with extracardiac congenital defects of the nervous system, musculoskeletal system, urinary system5.

The most frequent variants of congenital heart defects occurring in cardiology include ventricular septal defects, atrial septal defects, aortic stenosis, aortic coarctation, open arterial duct, large major arterial vessel transposition, pulmonary artery stenosis6.

In the structure of mortality in newborns, congenital heart defects rank first. Without the provision of qualified cardiac surgery, 50-75% of children die within the first year of life7,8. Early detection and effective correction of congenital heart defects with the subsequent systematic use of rehabilitation measures can significantly improve the prognosis and increase the overall level of health of this cohort of patients9,10. Given the seriousness of the problem of congenital heart defects, the goal is set in the work: to consider the issues of congenital heart defects in children and the main approaches to their rehabilitation.

Anatomical and physiological features of the heart in children

In children at any age, one can observe the specific features of the cardiovascular system in the structure and nature of the activity. First of all, these features are in the age uneven development of the heart and blood vessels11,12.
The heart of children grows unevenly at different periods of child development. During puberty, at the age of 12 to 15 years, as well as in the first two years of life, an intensive growth of the heart is observed. At primary school age, from 7 to 10 years, there is a significant lag in the heart from an increase in body weight and body size.

The walls of the heart are formed by three shells: the epicardium, myocardium and endocardium. The outer membrane of the heart is called the connective epicardium. The middle shell, which is formed by muscle tissue, is called the myocardium. Cardiac muscle is classified as striated, but, unlike skeletal muscle, its activity does not depend on the will of the person.

In general, fundamental differences and physiological features of the heart in children can be distinguished, unlike adults. The heart mass of a child is 0.8% of the total body mass, while in an adult person the heart mass is 0.5%17. The right and left ventricles are equal to each other, while in children the growth of the right ventricle of the heart lags behind the growth of the left ventricle. Also, children have relatively large sizes of atria and great vessels. The blood vessels in children are thin-walled, while the muscle fibers of the heart in children are thinner and denser arranged to each other.

In a newborn child, extraterine blood circulation is established, and small and large circles of blood circulation function. The left atrium is characterized by an increase in blood pressure due to large numbers of it. As a result, the valve of the oval window mechanically closes normally. The closure of the arterial duct occurs under the influence of muscle, nerve and torsion factors.

At the sixth week of a newborn’s life, the arterial duct closes, at 2 months - the venous canal closes, and in half a year - the oval window closes in the interatrial septum.

Etiology and pathogenesis of heart disease:
Congenital heart defects are the most common birth defects found in about 6–8 out of 1,000 live births. The level of modern results of surgical interventions for congenital heart defects indicates the possibility of these patients reaching adult and mature age.

The reasons for the development of congenital heart defects are still not fully identified. In most cases, they are due to genetic factors. The cause of some congenital heart defects is due to chromosomal abnormalities and is associated with a combination of genetic factors and adverse environmental conditions.

Pathological effects can affect the closure of the partitions between the atria and the ventricles. As a result, the partitions can close out of time or incompletely, valves are incorrectly formed, as well as the formation of constricted or abnormally diverted vessels.

Very often there is a failure of the left atrioventricular (mitral) valve, or mitral insufficiency. This is a pathological condition in which the leaflets of the bicuspid valve do not close the mitral orifice and during ventricular systole, backflow of blood from the left ventricle to the left atrium (the so-called mitral regurgitation) occurs.

The pathogenesis of mitral valve disease is incomplete closure of the valve leaflets. The mechanism of development of congenital heart disease is that it leads to the fact that part of the blood from the left ventricle returns to the left atrium at the time of systole. The left atrium accumulates a large amount of blood, and this leads to the development of its dilatation. An increased amount of blood also enters the left ventricle, which contributes to dilatation and compensatory hypertrophy. The blood additionally stretches the atrium, which leads to an increase in pressure in its cavity and myocardial hypertrophy.

With increasing pressure in the pulmonary circulation, dystrophic changes occur in the myocardium of the right ventricle: its contractile function decreases and congestion occurs in the pulmonary circulation.

Fundamentals of physical rehabilitation for heart defects: Physical rehabilitation of children who have undergone surgery for heart disease is an integral part of medical rehabilitation and is used in all its periods and stages.

Almost always, these patients use medical physical culture to adapt the heart muscle to the new conditions of blood circulation in the conditions of dosed exercise. The stages of physical rehabilitation, modes of physical activity of patients, means and forms of therapeutic physical culture are determined by what the nature of the defect and what is the current state of blood circulation.

Therapeutic physical culture is used in the form of therapeutic gymnastics, morning hygienic gymnastics and metered walks.
As part of therapeutic gymnastics classes, simple coordination exercises are used on all muscle groups with moderate muscle effort, static and dynamic breathing exercises of moderate depth with extended exhalation, dosed walking and walking on stairs: ups and downs. Classes are held two or three times a week and last for 30-40 minutes, of moderate density. Recreational aerobics occupies a special place in the rehabilitation of children of primary school age who have been operated on for heart disease. Improving aerobics combines simple exercises with music, dancing, jumping and running. It promotes the development of physical qualities and improves the psycho-emotional state of the child.
